"Investments"

"Investments are a problem,"
Stated pa the other night,
"Sometimes you pick a winner
If you do, the deal's all right;
But again when feeling lucky
Like you couldn't lose a cent
Something breaks and then you wonder
Where your hard-earned savings went.

"Now I've sunk my share of money—
I'll confess it with a grin—
Sharps of golden words and phrases
Found me ripe to gather in;
Stocks of almost every species,
Bonds, both regular and fake,
Schemes that only paid the schemer
Make a part of my estate.

"But I've tired of being a sucker,
Stocks and bonds are not for me,
Right from here the schemer royal
Of investment I shall be;
And my savings won't lie idle
Here's my plan—so simple too—
Scrubby cows will be supplanted
By the blooded full and true.

"Dividends—of course, but I'll have them—
Better calves, more butterfat
Less feed wasted, soothing knowledge—
I'll know where each penny's at;
That—and something more called interest,
Not the kind that's all per cent,
Working, caring, doing, living,
Just as God Almighty meant.

"Yes, I've gleaned an education
Paid for it, I will allow,
And it's just this bit of learnin'
That I'm wording for you now;
Nothing wrong with sound investment—
Schemers thrive where'er you go—
Here's the secret in a nutshell,
Money for the thing you know."

Montana. R. D. GALT.

"I'm quite a near neighbor of yours," said the local bore.

"I'm living just across the river."

"Indeed," replied his neighbor; "I hope you'll drop in some day."

Wayside Musings

Power and Service

JOSEPH S. MORRIS, WISCONSIN

THE widespread use of the power of the gasoline engine and of the power of electricity generated by harnessing the swiftly flowing water of great streams, has given a tremendous impetus to man's life. We are trying to do as much of the world's drudgery as possible by the use of machinery driven by gasoline, electrical and steam power. We are trying to save the human machine, to extend its life, to increase its usefulness. All this control of power and direction of it to useful work should make us rejoice that so much progress has been made in our world. In many respects we are better off than men ever have been before. The fact that there are still problems to be solved, injustice to be corrected, inequalities to be adjusted, does not relieve us of the obligation to be happy over the progress actually made.

As matters stand now, a man living ten miles from a town can get into his automobile and going at a reasonable rate of speed be in town in half an hour. In other words, wherever the automobile has gone it has brought within man's reach access to all the privileges and opportunities of the city man. It puts him in touch with the best things that are to be had in the city. It is also true that it has put the city man in touch with the blessings of the country. The gasoline driven automobile has been and will continue to be an immense blessing to man. The use of this power of speed merely for speed's sake has not been so great a blessing. Too great speed often spells disaster to the speeder and to others. With the acquisition of ever-increasing power the need for control asserts itself. This last is true wherever there is power. Uncontrolled power leads to disaster.

It is also true that in the life of every man, woman, and child there is tremendous power. It is asserted repeatedly by those in a position to know, that we do not begin to use the power we have and that far too frequently we make a bad use of that power.

The highest expression of the power of a human life comes through normal, wise development physically, mentally, spiritually, and socially. We want to have powerful lives. We should also desire that power, when acquired, be under the influence of the highest ends —be a blessing to ourselves and others.

The three great temptations that came to Jesus were the temptations to use His great power unwisely: 1. The temptation to abuse His specially great power. He was physically weak from hunger but His spiritual power made Him Master of Himself. 2. Then there was the temptation to use His power to take a short cut to recognition as the Great One that He really was. 3. The third temptation was the temptation to consent to the idea that evil ruled the world; to recognize its power and compromise with it. He met and overcame the three great temptations.

The spiritual mastery of Jesus in the lives of great numbers of people is due to His complete mastery of Himself. He would follow the great laws of steady, sure, permanent growth. He would gain world-wide influence not through selfishness, nor through putting men in awe of Him, nor through compromise with wrong. His leadership was to come by the willing assent of men to the great, eternal truths that are redemptive. He chose the longer but the surer way. Mushrooms may grow over night but not oak trees. I think that all men of powerful personalities come to be what they are because they are first, well-born; second, well-trained; and third, taught to serve to make their lives really useful to the world.

In every home in the world where there are boys and girls growing up, there is the power that shall rule the world tomorrow, rule it or ruin it. Look carefully to that girlhood and boyhood and guide it into useful, blessed manhood and womanhood by directing its growing power into ways of real service. Happy lives are useful lives, and useful lives are powerful lives. There is no greater unhappiness than that which comes through feeling that we are useless.

What is a Bull Worth?

HOARD'S DAIRYMAN:—It has aptly been stated that the final measure of the value of a dairy sire is the comparison of the production records of his daughters and that of their dams. If a bull does not carry production blood to the extent that his daughters are greater producers than their dams, such bull is of little or no value to the herd. Without records there is no way of measuring the productive value of the herd sire.

An investment which will pay 50 per cent dividends annually should be considered a good place to salt money away. One which will lose 28 per cent annually should be avoided. There are dairy sires which increase the productive capacity of their daughters fifty to one hundred per cent. There are others which decrease production through their daughters fifteen to thirty per cent or more. What is the difference in money value of the two classes of sires?

Testing was started in the Oktibbeha County (Mississippi) Cow Testing Association April 1st, 1921. This association has operated continuously since the above date. During the first two years it was difficult to get the members to supply complete information on their cows; such as: age of cow, name and number of sire and dam, when bred, etc. In some herds this information was supplied rather fully last year. The records are worth many times more on the herds where such information was kept.

During the last five or six years one herd in the above association has been headed by three registered bulls of very good breeding and reasonably good individuality. All of these bulls were sold when quite young and before their daughters had been tested. We will designate these bulls as No. 1, No. 2, and No. 3.

In tabulating the 1923 association records on this herd we find records on eight daughters of bull No. 1. The dams of these eight daughters also have association records. This bull was bred to cows which averaged 3,571 lbs. milk and 178.1 lbs. of fat. The eight daughters averaged 5,388 lbs. of milk and 260.5 lbs. fat. The daughters' increase over their dams was 50.8 per cent in milk and 46.2 per cent in fat.

Bull No. 2 was sold before he produced many heifers. We found records on three of his daughters and their three dams. The dams averaged 4,089 lbs. of milk and 203.9 lbs. of fat. The daughters averaged 5,869 lbs. of milk and 286.0 lbs. fat, or an increase over that of their dams of 43.5 per cent in milk and 38.2 per cent in fat.

Bull No. 3 had eight daughters tested whose dams were also tested. He was bred to cows which averaged 4,657 lbs. milk and 228.8 lbs. fat per cow. The eight daughters averaged 3,346 lbs. milk and 179.7 lbs. fat, or a decrease in production by the daughters of 28.1 per cent in milk and 21.6 per cent in fat. All records made by immature cows we figured to mature records.

The owners became afraid they had turned loose a valuable animal when they sold No. 3, so they purchased him back and put him at the head of their herd where he has a large number of daughters coming on. Since these records have been tabulated this bull has been headed toward East St. Louis. It was through the cow testing association that this "robber" bull was detected and went to justice. This information alone is worth more than ten years' membership in the association will cost the owners of this herd.

What is a good bull worth and what are cow testing records worth?

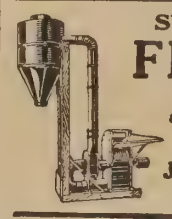
Mississippi. L. A. HIGGINS.

Michigan Short Courses

On October 27 will begin the first of the eleven Winter Courses in Agriculture to be offered at the Michigan Agricultural College this year. This course, which is the only one to start this fall, offers work in animal feeding, live stock judging, farm crops, agricultural engineering, dairying, soils, horticulture, and the study of sheep and hogs. Special instruction in the construction of radio receiving sets is also given to those who are interested.

The other ten courses, among which are listed the Eight Weeks General Agricultural, Horticultural, Dairy, Poultry, Beekeeping, and Agricultural Engineering Courses, start on January 5 and later.

These courses are designed to meet the needs of the young men of the state who are not able or who do not desire to take the full four-year course in agriculture.



Complete details of all these courses are contained in the new 1924-25 catalog which will be sent to any address upon application to the Director of Short Courses, East Lansing, Michigan.

Southern Students' Judging Contest

In the dairy cattle judging contest for Southern Agricultural Colleges at the Tri-State Fair, Memphis, September 22, the team from the University of Arkansas won the trophy for highest team on the three dairy breeds while Oklahoma State College was second and North Carolina State College third. The Arkansas team was highest on Guernseys and Jerseys, while Oklahoma won the trophy for Holsteins.

In classes for individual students Lytle C. Baber of Arkansas was high man on the three dairy breeds and also on Guernseys; while Travis R. Thomas of Arkansas was high man on Jerseys and Robert Richardson of Oklahoma on Holsteins.

Professor J. J. Hooper, University of Kentucky, was superintendent of the contest and Robert Haeger of Algonquin, Illinois, was official judge. Professor W. W. Swett, U. S. Department of Agriculture, Washington, D. C., assisted with the contest.

LUCY THOMPSON

"The Greatest Show on Earth"

I couldn't help thinking of this old slogan of Barnum's when I was over at Milwaukee at the National Dairy Exposition. It was a wonderful treat to me as I had never seen one before.

Of course I was most interested in what was offered for women and as I was thinking it over coming home on the train I decided that the woman's side of it could all be summed up in one word—Health.

I don't mean to say that the manufacturers of separators, churns, bathroom fixtures, and so on didn't have us all in mind but their exhibits, it seemed to me, were arranged mostly to catch the men's eyes. I guess it was a good idea, too.

There was one section that had a good many men looking at it though it was planned for the women, and how I wish you could all have seen it. The displays were wonderful but the thing that stood out above everything else was the cleanliness. "Spick and span" must have been the motto of everyone there for that is what they all looked and of course that is what anything connected with milk should be.

Everywhere you turned there was something about good health for yourself and your family. One woman even went so far as to say that she believed she would live to see the time when it would be counted a disgrace to be sick. Of course all this delighted me for health has always been a hobby of mine. I get ashamed of talking so much about it but I seem to keep right on doing it.

I think the most striking display for the women was one worked out, I was told, by Miss Gladys Stillman of the University of Wisconsin. If health is my hobby, milk is Miss Stillman's and she just lives to get people to see why they should use more of it.

Her display showed Ponce de Leon looking for the Fountain of Youth. Of course he was only a dressed-up figure but he was so life-like that you almost wanted to speak to him. There he stood looking at a clear pool of water in the grass and you felt sorry for him because it seemed that he knew he had not found the right thing.

On beyond was a counter of patent medicines on which people used to rely so much but whose worthlessness has been thoroughly exposed. Past that was a tableful of the most wonderful cosmetics—everything under the sun to make you look beautiful. But these were shown to be the wrong thing because we know now that health—and therefore true youth—can never be put on from the outside.

Then came the last scene—the true Fountain of Youth. It was a fine bronze-like statue showing some beautiful cows and above them sprayed and bubbled a fountain of the only perfect food—milk.

It was very convincing and of course on every side were little booklets showing not only what to do for health but, more important, why we do it.

Then there were the health lectures and the recipes! We could hardly wait to get home to try some of the new things to cook.

I must tell you a story that one of the demonstrators told. A woman brought her baby to a visiting nurse and told her that it was so cross and fussed so much that she could hardly stand it. The nurse told her how to feed it properly and the mother went away.

In two weeks she came back and reported that the baby was fine and never cross any more. But still she lingered and finally the nurse asked her what more she could do for her. The woman astonishingly said in her foreign accent, "What I give my husband?" Of course everyone laughed but I think everyone saw that there was a point there worth serious consideration.

Some other time I want to tell you about a demonstration meal I saw cooked and served by some young club girls. I was very proud of the poise they showed and the ability they had to answer questions. I was particularly interested in the fact that when questions were called for, the men were the only ones who asked them.

If the next national gathering is held at all near you, I think it would give you as fine a recreation as you could think of to go to it and meet the successful, optimistic people who are doing the same sort of work that you are. Let's plan to meet at the next one.

A New Point of View

I know a woman who, rather late in life, has just had her first baby. Both are strong and healthy; the baby is as little trouble as possible and the mother even has help with the work. But she makes the baby the excuse for being constantly busy about little things and assumes an injured tone if her husband even suggests that she take a walk with him.

She always says with a sacrificial air, "But, dear, the baby ——" and then he knows he is in for a losing argument about how much a woman has to give up for her children and how men just can't see things through a woman's eyes and that if he could just see what she has to do all day long he would never think that she could go for a walk, and so on indefinitely.

The trouble is that she is so close to things that she can't see them clearly and she won't allow herself to get far enough away to get a look at how foolishly she is acting. Of course she enjoys playing the martyr just like the woman I used to know who had a good-sized family and lots of work to do, but in order to make everyone think what a hard time she had she used to go out and help the neighbors with all sorts of heavy work so she could tell about it.

What these women need is to get clear off and take a good look at the situation as if they were seeing themselves through other eyes. We all need that. Most of us let our work surround us and control us without ever trying to see whether or not it is necessary.

Whenever you find yourself like that, just drop things and get off alone, preferably out of doors, for half an hour. Then don't waste any time thinking how things in the house are all going to ruin and how the family is wondering what on earth you are doing. Just forget them for a while and think of all the wonderful men and women who have passed through the world surmounting with quietness troubles much greater than yours and I think that it will fill you with courage and a feeling of fellowship with greater spirits.

I wish all of our houses could be built so that each member of the family could have a place to which he could retire and be absolutely alone. I wish, too, that the practice were common enough so that no one would think it queer if we wanted to be by ourselves at times. It is one of the greatest helps I know in seeing things in their true relations and in keeping the petty things from filling up the whole horizon.

No Need to Boil Them

Every wash day I remember with gratitude the woman who first told me that it is not necessary to boil the clothes. If she had been the sort who always puts out a grimy washing I would not have given it a second thought but because her clothes were so clean and fresh looking, I tried it and it works like a charm.

There are so many things we do just because our mothers did them. They did them for the same reason but life seems more complicated in these days and if we can save an hour or more of work a week, it is just another step ahead. We wouldn't mind the extra work nor the occasional scaldings if we were really turning out superior work but I have decided that boiling clothes is a superfluity.

If you soak your clothes over night you can then start the washing in boiling water but not soaking them and then starting them in only hot water amounts to the same thing and saves a lot more work.

A good washing solution is made by cutting up a cake of soap in two quarts of water and simmering to dissolve it. When it is cool add two tablespoons of borax and use about 2 cupfuls of this mixture to each machineful of clothes. Too heavy a lather does not make for the cleanest washing as the clothing slips together rather than rubs and there is not enough friction. Ten to twenty minutes in the machine is enough.

Of course we all aim at perfection but I would say that whatever dirt remains in the overalls at the end of twenty (or even ten) minutes should be allowed to stay there. I have more than once rubbed the skin off my knuckles trying to get them spick and span but, as the funny papers say, "them days are gone forever". There are a few things that it doesn't hurt us not to see and the dirt in the overalls is one of them.

Sunlight is the best bleach and disinfectant there is and after you have washed and rinsed the clothes well, it will do the rest so save yourself the time you spend on the boiling and the clothes will never be any the worse for it.

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

No. 2202—Cuts in One Piece. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 takes 4⅛ yards 36-inch material. Hot-iron transfer pattern No. 706, blue and yellow, costs 15c extra.

No. 1922—For Informal Afternoon Wear. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 takes 3 yards 40-inch material.

No. 2213—Becoming Fall Model. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 4 yards 40-inch material. Hot-iron transfer pattern No. 708, blue and yellow, costs 15c extra.

No. 1942—Practical Apron Style. Cut in sizes 36, 40, 44, and 48 inches bust measure. Size 36 takes 2⅝ yards 36-inch material.

No. 1893—Slip that can be made with built-up shoulder and V-neck or with straight upper edge and shoulder straps. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 takes 2⅞ yards 36-inch material.

No. 2201—Jaunty Style for Girls. Cut in sizes 6, 8, 10, 12, and 14 years. Size 8 takes 2⅜ yards 36-inch material.

No. 2204—Attractive Apron. Cut in sizes small, medium, and large. The medium size requires 1½ yards 36-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

How many leaky faucets have you in your house? Remember that the water runs out of them while you aren't looking the same as when you are.

The Certified Bottle Cap

Used by the milk distributor mindful of the service rendered to his patrons.

A few advantages of the Certified Cap:

1. The Red Flap of tough rope fibre can be easily grasped—no fork or icepick required.
2. The Red Flap won't pull off—the wire staple holds it securely.
3. The Red Flap can be easily seen—it is distinctive.

Remember the name—CERTIFIED—and look for the Red Flap. If your jobber cannot supply you, write direct.

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Write for free sample bottle.

Friendly Talks for Farm Folks

Pearls are found in oysters and in the milk of cocoanuts, while Amos Springer bought his wife a pretty pearl ring from the city the other day out of the proceeds of his milk check.

⚜

Grandma Bascom is heaving vast sighs of relief these days as the cold days approach, Providence having spared her little cottage from being struck by lightning once more.

⚜

Armies of grasshoppers which are called "Painted Ladies" are invading the southwestern states from Mexico and eating everything before them. However, unlike most pests, these hoards of grasshoppers are said to only consume weeds which the farmer is most thankful to be rid of. As Ben Russell says, he wishes to gracious the critters would come jumping out East and clean up the weeds on his patch of ground. It would be so much easier than to run the cultivator.

⚜

John Stradling states that he is personally far more interested in the November price of milk than in the outcome of the election. He goes so far as to assert that it is far more important that the farmer make sufficient milk than whether Davis or Coolidge polls the more votes. John says that good prices for wheat are seventeen times more noteworthy than a Democratic or Republican or Progressive victory. We second all these motions and then some.

⚜

Marietta Bonnet from the city was one of those terrible flappers one reads so much about but rarely meets up with in the country, at least. Marietta rolled her own and toted a pocket flask—although I have a grave suspicion that was filled with weak tea—and was always throwing in a near-swear word and staying out late nights and doing everything her immature mind could think up to shock and make talk in our community. Not long ago Marietta announced her engagement to a young man from the country who is as sterling and straightforward a character as you often see. Of course we were all surprised at the choice all around, and folks told Fred he had made a big mistake, while Marietta's relatives predicted much boredom and unhappiness for her when married to the poor country hick. Some of the country girls were pretty mad that Marietta had landed Fred, and when one of them tendered the bride-to-be a shower, they decided to get even with her. So when the big clothes basket containing the gifts was opened by Marietta at the party, what did she undo from countless wrappings but a great granite spittoon! Well, Marietta proved herself a real girl when the cruel joke descended upon her by bursting into tears of rage and mortification. The neighbors say that the other girls were real sorry they helped to do such a thing and tried to comfort poor Marietta to the best of their ability. But one of the young men of our town, a friend of Fred's, told Ike Bartoo's sister who told Mrs. Morton who told me, that Fred himself grinned in a knowing way when the tale of the spittoon shower reached him. At any rate, Fred and Marietta are now married and if you will believe it, that girl no more thinks of pretending to drink or smoke or swear than an innocent baby. But you can't make me believe that Fred was at the bottom of that spittoon business.

New York. HELEN S. K. WILLCOX.

To Keep the Beauty of Your Teeth

"Wash"—don't Scour Them

Avoid grit in your dentifrice as you would sand in your toilet soap.

Colgate's "Washes", Polishes, Protects.

The washing action is the action of mild soap, the ingredient that leading authorities endorse.

The polishing action results from the soft, non-abrasive chalk that loosens clinging particles, and brightens the entire surface of the teeth.

The protecting action is the combined action of the chalk and soap which cleans thoroughly but does not scratch or scour the thin enamel.

Colgate's Ribbon Dental Cream contains no grit, no harmful drugs. It is not medicated, for the function of a dentifrice is to cleanse, not to cure.

MAKE MORE MONEY FROM YOUR MILK With The MINNETONNA HOME BUTTER MAKER

There is always a big demand in every town and city for good butter made on the farm. It can usually be sold as soon as made at a premium of 3c to 4c over the market price. With the Minnetonna Home Butter Maker you can make the finest butter for which you will find a ready market, and make more money from your milk and cream.

The Minnetonna not only churns the butter, but works it in the machine. Electric motor (¼ H. P.), gasoline engine (1 H. P.) or hand crank drive. Will churn 12 gallons of cream or less. Works 3 to 20 lbs. Large sizes up to 100 lbs. capacity.

Write for free booklet.

With the Juniors at the National

(Continued from page 417)

number of old friends. F'rinstance, there was A. G. Kettunen, otherwise known as "Ket", assistant state club leader of Michigan. Other leaders with him were Paul Banker, Art Hagen, and E. C. Sackrider. These men were looking after a bunch of some forty Upper Penninsula club members including my good friend, Francis Pelletier. Then there were some more Michiganders—Nevels Pearson, assistant state club leader, L. H. Matthias, Hillsdale county club leader, and R. A. Turner formerly state club leader, now with the club department of the U. S. Department of Agriculture. Mr. Matthias had several Hillsdale county club members with Coe Emmens among them. Pearson had the judging boys.

Well, sir, after the chicken, baking powder biscuits, gravy, potatoes, and other good things had disappeared from the table as quickly as though a cyclone had swept them off, pandemonium broke loose. It nearly cracked the roof of the concrete grandstand. I have attended many big football games, attended by thousands, also basket ball games and baseball, but never have I heard more enthusiasm uncoiled than rent the air at this banquet. Imagine twenty states, represented by lusty, husky, big-voiced boys and girls, yelling and singing at once. It's a hair-raiser! I musn't forget to tell you, though, that Mr. Herrington *did* lead us in some good songs.

T. A. Erickson was toastmaster, and a good one he was, too. The first thing he did was to call upon a representative from each state for a few words. Invariably the clubber said several nice things about the good time he and his fellow club members were having. For impromptu speakers they were all mighty good. Mrs. Nellie Kedzie Jones, "Aunt Nellie", told the boys and girls the story of the milk fairies. Dr. Dorward delivered "The Master Key" in a most fascinating way. Last but not least Mr. Noble announced the winners of the judging contest. Here they are:

Iowa first; Nebraska, second; Minnesota, third; Maryland, fourth; and Indiana fifth. The honor of being the highest individual went to Harlan Leonard of Iowa followed by John Chambers of Minnesota with Raymond Nixon, Nebraska, third and Donald Johnson of Indiana and Amos Holter of Maryland tied for fifth.

Wednesday, the demonstration teams continued in their contest. Early in the morning the Blue Valley Creamery trip winners left with G. L. Noble for an all day trip to Chicago. Parties also left to visit leading dairy farms in the neighboring territory, including the famous Pabst Stock Farm and Carnation Stock Farm. After the noon meal the boys and girls had the privilege of hearing Harold Gaulrapp, a member of the Illinois champion junior judging team last year. Harold told all about his trip to England this summer, also Switzerland, Islands of Guernsey and Jersey, and Scotland. He described the international contest in England and admonished the Iowa team to fight all the time and they, too, would return victorious and bring the cup back for permanent possession in this country. Harold is a Hoard's Dairyman Junior. We're proud of you, Harold, old man. "Dad" Wise, coach of the Illinois team also spoke.

Mr. Frisbie announced the winners in the health contest. Minnesota and Pennsylvania received high honors. "Monica Zurn of Minnesota was the healthiest girl with a score of 98.3. Charles Carter of Pennsylvania is the highest scoring boy. His score was 98.—" Here Mr. Frisbie paused, then, "This is once when a girl beats a boy." Yelling from the girls. "If you don't stop to read fractions. Charles Carter's score was 98.5." Loud applause—evidently the boys appreciated the victory. There were seventeen contestants entered. I had the photographer take Monica's picture but he wasn't used to photographing such healthy girls and it did not turn out well.

On Wednesday evening the club members had a rare treat—a theatre party given by the Rotarians of Milwaukee. Every member of the party—200 strong—had a fine time. Special cars were chartered to take the clubbers from and to camp. Thanks, Rotarians!

IOWA JUNIOR JUDGES WIN CHAMPIONSHIP HONORS
Left to right: Coach V. B. Hamilton, Harlan Leonard, Lester Olsen, Raymond Monahan.

Thursday arrived and brought a battle royal in deciding the demonstration team contest. When all teams had demonstrated it was found necessary to have two teams give their demonstrations again, Nebraska and Minnesota, to work off the tie. This took until the noon hour. Entertainment at meals abounded. At noon I gave the members a solo on my musical saw, sort of a little novelty act. A juvenile band of 150 pieces then came up and gave several stirring selections. The band came from Janesville, Edgerton, and Evansville, (Wisconsin) high schools. Girls as well as boys played in it. In fact, a girl played the bass drum and another the snare drum.

An important announcement was made after the band concert. E. L. Austin, judge of demonstrations, gave his decisions. When the smoke had cleared away the laurels rested with Nebraska. Minnesota was a mighty close second. Raymond Nixon and Olin Brown, the Nebraska team, gave a corking good demonstration on judging a dairy cow. Judge Austin's all star team was composed of Raymond Nixon, Nebraska, and Le Roy Kohler of West Virginia. The all star girls' team was made up of the two girls on the North Dakota team, Mary Cotner and Edna Vogel. He declared Mary Cotner to be the best girl demonstrator. Raymond Nixon was the best boy demonstrator. The Nebraska team gave their demonstration once after dinner, posed for the photographer, and then pulled for home. They were coached by County Agent J. H. Claybaugh, and State Leader L. I. Frisbie.

LILA SCHMID AND HER BLUE RIBBON BROWN SWISS HEIFER, BROWNEY'S LAST

Club members and leaders left camp by the score Thursday afternoon. A new feature on the program was the Milwaukee nurses' calf club judging contest. Prizes were given to the winning boys and girls by the Gridley Dairy Co. of Milwaukee. The nurses picked those calves and their owners which appealed to them the most.

The weather was fair and windy on Friday morning. Shortly after nine o'clock the first class was led into the ring, Brown Swiss bulls. The judges were J. P. Eves of the Dairy Farmer and L. V. Wilson of the University of Minnesota. Mr. Bewick, superintendent of the club department, asked me to act as clerk in the ring and take down officially the awards. I was glad to do this as it gave me an opportunity to meet personally the winning boys and girls. At my elbow during the day was Guy Noble, genial editor of the S'News. He took down the awards hot off the books. F. E. Heinzelman, county club leader from Syracuse, N. Y., assisted in selecting premier showmen, as did Mr. Noble, and E. R. McIntyre of the Wisconsin Farmer.

At noon, Earl Cooper, junior extension leader of the Holstein-Friesian Association of America, led the calf club exhibitors in singing. It was at this time that the "barber shop quartette" was discovered, Earl Cooper and R. A. Turner, tenors, T. L. Bewick second tenor, W. McNeel baritone, and Guy Noble second bass. They turned out some great harmony and got several encores.

Judging of calves was resumed at 1:15 and continued until late. This was followed by the junior showmen's contest staged by the Wisconsin Live Stock Breeders' Association and open to all.

I totalled up the calves shown and counted 164 calves that entered the ring. Of this number Holsteins led with 78 entries, Guernseys were next with 32, Jerseys third with 30, Ayrshires fourth with 15, and 9 Brown Swiss calves. Since Mr. Noble gave such a complete list of awards in the last issue of the S'News, I'm going to copy the first three places in each class from there.

After placing each class, the four first prize winners were brought together and a grand champion sweepstakes award was made in each breed, the winners being as follows: Holstein: Clarence Halle, Wisconsin, on General Homestead Mercedes. Jersey: Barbara Luchsinger, New York, on Raleigh's Golden Mazie. Ayrshire: Harold Nelson, Wisconsin, on Edgertoune's Piry. Brown Swiss: Lila Schmid, Wisconsin, on Maiden's Master. Guernsey: Marple Mountain, Iowa, on Cherub's Beautona of Iowanola.

The winners in the Showmen's Contest were: 1st, Robert Seitz; 2nd, Clifford Keppen; 3rd, Irene Davis, all of Wisconsin.

In addition to the prize money usually awarded by the National Dairy Exposition, the sweepstakes winners were presented with gold watches provided by the Blue Valley Creamery Company. The showmen were presented with awards by Mr. Frank Fox, of the Wisconsin Live Stock Breeder's Association.

The Holstein Heifer Class (Calf) was the largest of any shown during the day and made a wonderful appearance in the ring, completely filling the arena, which was roped in by the officials. Fifty-six head were in this one class. The first awards in all classes were as follows:

Holsteins

Heifer Calf—1st, Alfred Biels; 2nd, Elmer Stolper; 3d, Caroline Harley, all of Wisconsin.
Yearling Heifer—1st, Earl Crowell; 2nd, Irene Davis; 3rd, Stanley Stevens, all of Wisconsin.
Two-year-old Heifer—1st, Edith Clark, Wisconsin.
Grade Heifers—1st, Vernie Suchow; 2nd, Stanley Buschendorf; 3rd, Hartwig Hendrickson, all of Wisconsin.
Bull Calves—1st and Grand Champion Sweepstakes; Clarence Halle; 2nd, Loraine Zimmerman; 3rd, Donald Lalor, all of Wisconsin.
Wisconsin County Herds—1st, Sheboygan; 2nd, Clark; 3rd, Rock.

Jerseys

Heifer Calves—1st and Grand Champion Sweepstakes. Barbara Luchsinger, New York; 2nd, Lenore Wyatt, Wisconsin; 3rd, Foy Mendenhall, Indiana.
Yearling Heifer—1st, Adolph Mistele, Wisconsin; 2nd, Foy Mendenhall, Indiana; 3rd, John Luchsinger, Jr., New York.
Two-year-old Heifer—1st, Foy Mendenhall; 2nd, Joe Sumner; 3rd, Don Hinkle, all of Indiana.
Grade Heifer—1st, Mildred Antholt, Wisconsin.

Ayrshires

Heifers—1st and Grand Champion Sweepstakes, Harold Nelson; 2nd, Robert Seitz; 3rd, Daniel Hanrahan, Jr., all of Wisconsin.
Bull Calf—1st, Wm. Walvoord, Wisconsin.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Rectum Obstructed by Cyst

We have seen on several occasions a peculiar condition in cattle caused by collection of a large quantity of fluid in a sack or cyst located between the rectum and vagina, in the loose tissues, and so bulging upward that the passage for feces is partially or wholly shut off. The fluid gathers gradually. For a time it does not cause apparent discomfort but when the passage becomes so occluded that voiding of feces (defecation) is rendered difficult, straining draws attention to the condition and the animal is found to be in considerable distress. If not relieved by operation the fluid continues to increase in quantity until passage of feces stops and the animal soon has colicky pains when in that condition. Straining is frequent and attended with pain. The animal may even bellow or groan. Urine is voided in spurts during the straining spells. So sick may the animal become that it loses appetite, may stop chewing the cud, and shrink in milk flow results. The fluid is collected in the pouch of Douglass and has to be liberated by the surgeon.

For the operation the animal should be confined in stocks, if available, or she may be confined in stanchions and her hind legs roped to prevent kicking. The rectum should be flushed out with warm water to remove the collected feces. The fingers may have to be used to bring away the first of the feces. Oil may then be injected freely or the parts well lubricated with a decoction of slippery elm bark, unsalted lard, or vaseline. The hand may then gently be introduced and discovers the floor of the rectum pressed upwards by the fluid mentioned. Surgical treatment now consists in insertion of a trocar and canula, with a rubber tube attached, to draw or siphon the fluid from the cyst. A curved metal catheter may be used for the purpose. The hand guides it to the proper place and it is then thrust into the cyst. When the flow slows up manipulation with the hand may be necessary for extraction of all fluid. Relief is at once apparent. The animal stops straining, defecates normally, and soon goes to eating. A second operation rarely is required.

Garget

I am getting so many three-teated cows. Can you tell me what makes that? I am using a milking machine. After I use the milking machine I always strip them. They get a hard bag. Do you think that you spoil a cow by using the machine? Some of them don't let the milk down. When do the cows give the most milk then, by hand or use the machine?

Rushford, Minn. P. B.

One cow, at least, is a carrier of a germ-caused (streptococci) form of mammitis, mastitis, or garget and the cups of the milking machine are carrying the infection from cow to cow. The infection may also be spread by the milker's hands or be contracted by the teats coming in contact with ground or floors contaminated with unsound milk or pus from an affected udder. The machine should be more carefully and thoroughly sterilized and the cups should be perfectly adjusted. A cup not so adjusted may cause simple garget and is commonly followed by the infectious form of the disease. Isolate affected cows and milk them last, by hand. Catch abnormal milk in a pail containing a disinfecting solution and then throw it out in a place to which cows have not access. "Dry off" and fit "three-teated" cows for the butcher. Have a veterinarian give preventive and curative treatment with mastitis bacterin and follow his instructions as to local treatment when udders become affected.

Hematuria—Suppressed Estrum

Could you tell me what causes my cows to pass bloody urine?

Have a cow that came fresh 6 months ago and she has not bred yet. What should I do? She has only had one calf.

Birkenfield, Ore. W. J. B.

The cow is probably affected with hematuria, popularly called "red water", that is prevalent in the Pacific Slope states. It is attributed to microorganisms, possibly protozoan, existing on wild pasture and possibly in surface water. Another theory is that it is caused by acrid plants in the pasture. No specific remedy has been found, so far as we are aware, but the veterinarians of the agricultural experiment stations of Washington and Oregon have been investigating the disease for years and may have something new to report. Apply to them for bulletins on the subject. Meanwhile keep the cow off pasture. Give her an entire change of feed and twice daily give her one dram of powdered alum and ½ a dram of dried sulphate of iron in feed. Increase the doses gradually, if required.

A veterinarian should be employed to manipulate the ovaries by way of the rectum, to rupture cysts or dislodge persistent "yellow bodies" which sometimes cause suppression of heat periods (estrum). Meanwhile flush out the vagina 2 or 3 times a week with a gallon or more of blood warm boiled water tinged light pink with permanganate of potash.

SPOHN'S DISTEMPER COMPOUND

Don't take chances of your horses or mules being laid up with Distemper, Influenza, Pink Eye, Laryngitis, Heaves, Coughs or Colds. Give "SPOHN'S" to both the sick and the well ones. The standard remedy for 30 years. Give "SPOHN'S" for Dog Distemper. 60 cents and $1.20 at drug stores.

POULTRY On The DAIRY FARM

O. A. HANKE

Getting Ready for Winter Eggs On the Farm

This winter promises to be a very favorable winter to the poultryman, whether he be the specialty poultry farmer, or the dairy farmer with his small flock of layers as one unit of his diversified farm. The past spring was, in a measure, unfavorable for the growth of chicks and aided materially in the high mortality experienced by many chick raisers. This mortality is going to be reflected in the form of a short crop of pullets this fall.

Poultry on the dairy farm is a very essential unit. Eggs help pay the grocery bills and in many cases buy the clothes for the family. A dairy farm is incomplete without a goodly flock of layers.

Pullets Fill the Egg Basket

The first year a fowl lays, which is known as the pullet year, is the most profitable period of production. During the pullet year practically all chickens lay their greatest number of eggs. The more eggs a hen lays in a year, the greater will be the profit. Statisticians figure that 100 eggs are required from each hen to pay her feed bill. All eggs laid above that number are profit. It behooves us then to keep the majority of that kind of fowl which is going to be the largest profit makers.

A hen in her second or yearling year of production on an average lays 88 per cent as many eggs as she laid in her pullet year and lays 88 per cent as many eggs in her third year as she laid in her yearling year. This illustrates why it is most satisfactory to maintain a goodly flock of pullets from which to expect the greatest profit.

Yearlings Should Be the Breeders

If one is to hatch chicks from one's own flock, it will be necessary to keep those pullets which came through their pullet year most satisfactorily, for the yearling year to be used in the breeding pen. These pullets which are now yearlings should be mated to pure-bred cockerels from high production ancestry. On the average the safe figure is 75 per cent pullets and 25 per cent yearlings.

Preparing the Pullets for the Lay

The dairy farmer's pullets are still on range, whether it be a green field of alfalfa or clover, or whether it be the lawn or the grass about the farm yard. March and early April hatched pullets should be ready to lay by the first of October and should get into their heaviest production by Nov. 1st, at which time egg prices will be unusually high. At this time of year the pullets should be carefully observed for comb and wattle development. If a majority of the larger pullets are developing an unusually large comb, it indicates that they have access to feeds too high in protein. Some pullets will naturally develop sexually faster than others but the majority of them should be used in this observation.

Conditioning the Pullets

If speedy development is noticed in the pullets it will be well to reduce the amount of protein in the mash to a nominal per cent. A good ration at this time will consist of 100 lbs. ground corn, 100 lbs. ground oats, 100 lbs. wheat bran, 100 lbs. wheat middlings, 20 lbs. meat scrap or tankage, 1 lb. salt.

The scratch mixture to be fed with this should consist of 3 parts cracked corn and 1 part wheat or oats. The idea at this time should be to develop a large chicken with a strong frame, well covered with fat.

Bringing Pullets into Production

Several weeks before they are ready to lay they should be changed gradually to a ration composed of equal parts by weight of ground corn, wheat middlings, ground oats, wheat bran, meat scrap or meat meal, 2 lbs. salt. And a grain mixture of 200 lbs. cracked corn and 100 lbs. wheat or oats.

The pullets should not be forced excessively through the use of wet mash during the first few weeks of lay, for this may prove to be too great a strain on their system and may throw them into a molt. This fall molt in pullets is very undesirable since a complete molt usually results, which withholds the pullets from again laying until early spring.

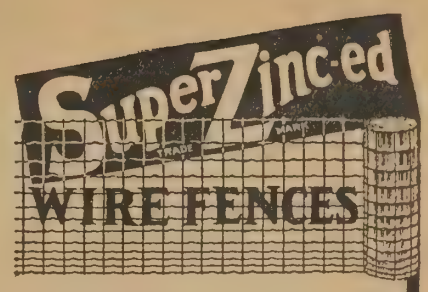
Prepare to Keep Records on the Pullets

Trapnesting, which is the only accurate means of determining the number of eggs a hen will lay per year, is too costly a system for the average farmer to use. There is, however, another very practical method of checking a pullet's production in a certain measure at least. When the pullets enter the laying house in fall they should be banded on the left leg with a colored celluloid band to denote their age. The right leg should bear no band at this time. During late December or early January, it will prove very profitable to the farmer if he will take a little time to go through his pullets to ascertain which have already begun laying and which thus far have failed to lay. This can easily be learned through the pigmentation test. Those pullets which have faded eyerings, faded vent, and a faded or partially faded beak have been laying for some time. These pullets will also show two or three finger capacity between the keel or the breast bone and the pubic or the lay bones, which are found on either side of the vent. Those pullets which have not begun laying will have the breast bones and lay bones almost close together and the intervening flesh will be hard to the touch. Those pullets which at this time show the greatest period of production should have a blue band placed on the right leg. Those which have laid a shorter length of time a red band, and those which have not yet begun to lay, a white band.

Later on in March this same procedure should be repeated with the same system of banding. Later in June when many pullets cease laying, the same procedure should be used, and those pullets which have quit laying give a white band. These may be sold at this time for they will undoubtedly not pay for their feed the rest of the season. In August they should be gone over again and those which have ceased laying should be eliminated. At this time the books should be closed, "so to speak", on this flock of pullets. Those birds which should have four blue bands on their right leg should unquestionably be kept for the yearling year to be used as breeders. Those birds which have less than two blue bands should undoubtedly be eliminated. This system of record keeping on a flock of pullets is very satisfactory and requires only a minimum amount of time.

Summary

The previous paragraph is undoubtedly a trifle out of the subject but the writer has incorporated it to stimulate the dairy farmer, who now has a flock of pullets growing, into caring for these pullets properly so that they may bring the greatest amount of profit. By illustrating how checks may be had on their production the writer hopes to interest some poultrymen who do not have time to trapnest but are very desirous to have some check on their flock.



Plan now to properly care for your pullets this winter.

Feed a balanced ration as illustrated by the laying mash cited above.

March and April hatched pullets should get into heavy production by Nov. 1st.

Do not excessively force pullets by the use of wet mash during the first few weeks of production.

Treat the pullets gently and they will learn to like you and lay more eggs.

Here is what every farmer wants, "Super-Zinced" Wire Fences. A special formula of open hearth steel wire is "Super-Zinced" by our improved process and takes on an EXTRA HEAVY AND WELL BONDED coating of zinc that will not crack or peel. This produces fences of great strength and durability and establishes a new standard of fence value.

Columbia Fences

of course, are "Super-Zinced." Their natural sturdy construction and superior rust protection assure long and satisfactory service. Both Columbia and Pittsburgh Perfect brands of fence are "Super-Zinced" and include standard styles of farm, poultry and garden fence; also our attractive designs of lawn and flower fences.

"Super-Zinced" Fences improve your farm and increase farm profits; they COST NO MORE than ordinary galvanized fences. Be sure to write for Super-Zinced Fence catalogue and 72-page Farmers' Handy Manual, both sent Free.

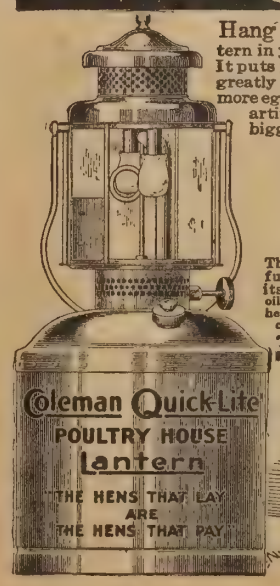
Pittsburgh, Pa.

Dairying in the Ozarks

THE Ozark Dairyman prospering with the rapidly growing butter fat production of the Ozarks, has everything his way today. Land, ideally located, is still reasonably priced. Blue grass flourishes, and the grazing season is ten months long. Gentle hills give natural shelter from winter winds—and these winds are further tempered by an average winter temperature of 41.6 degrees. The Ozark summers are as ideal for dairying as the winters—with an average temperature of 78.9 degrees. To top such favorable climatic and grazing conditions, is the advantage of Ozark water—clear, cold, pure—gushing in springs from the hillsides, running in sparkling streams and rivers throughout the Ozark territory.



FRISCO LINES

These conditions are behind the rapid growth of the dairy industry in the Ozarks. They make it possible for a man to start with much less capital, with smaller outlay for animal shelter than would be necessary in the north, and with every opportunity for success. All the forces of nature are in his favor—and efficient railway service provides the outlet for his products.

Hard roads, good schools, progressive, growing communities and the healthful climate make the Ozarks a most desirable homeland. In such surroundings the Ozark Dairyman is a big factor in a growing state. Write me!

J. N. Cornatzar, Pass. Traffic Mgr., Frisco Lines, Room 804, Frisco Bldg., St. Louis, Mo.

More Light-More Eggs!

Hang the new Poultrymen's Coleman Quick-Lite Lantern in your hen house a few hours these winter nights and mornings. It puts your hens on a spring laying schedule. Longer feeding hours greatly increase egg production. Users report from 15% to 20% more eggs Poultry authorities and practical poultrymen recommend artificial light to boost the egg yield. Thousands are now making bigger profits by getting more eggs while prices are high.

Coleman Quick-Lite Poultry House Lantern

This new, improved Quick-Lite with extra large fount holds 5 quarts of fuel—gives 50 hours of brilliant light from one filling. Makes and burns its own gas from common motor gasoline. Brighter than 20 old-style oil lamps. Can't spill fuel even if tipped over. Lights with matches. Built of heavy metals. Will last a lifetime. Mica globe. Won't blow out. Write for complete information about "More Light—More Eggs." Address Dept. HD13.

THE COLEMAN LAMP COMPANY, Wichita, Kans.
PHILADELPHIA CHICAGO LOS ANGELES TORONTO, CANADA

A Trip to the British and Channel Isles

(Continued from page 397)

borne by the government. Fully 90 per cent of the cows entered in these societies are Ayrshires. Last year 32,000 cows were tested and the average production amounted to 7,500 pounds per cow. When the production of the average Ayrshire cow is compared to the average production of the milk cow of Michigan the figures are startling. The average cow of Michigan produces less than 4,000 pounds of milk annually while the 25,000 in cow testing associations last year in Michigan made an average of 6,500 pounds of milk per year. Greater still is this comparison in favor of the Scotch cow when one considers that the cow in that country produces her 7,500 pounds of milk in an average period of 40 weeks or less and subsists on pasture alone.

Another interesting section of Scotland is the beef producing section to the north coast. This is the home of the Scotch Shorthorn and the Aberdeen Angus. The most interesting feature about the development of these thick fleshed breeds of cattle is the fact that the wonderful grass in this section has made their development possible. The cattle get very little grain which consists principally of oil cake which is fed with straw or roots during the winter months. The cattle are kept in good flesh all the time. The breeder does not allow the cattle to get in a thin, run-down condition as he figures that it is most economical to keep the cattle in a good condition all the time.

The North of Scotland Agricultural College is located in Aberdeen. Adjoining the college is the Rowett Institute which was officially opened by "Queen Mary" in September, 1922. This institution was founded for the purpose of carrying on research work with live stock. Dr. Orr, the director of the institute, and his associates are conducting work along fundamental scientific lines and this is the only institute of its kind in Great Britain. The work being carried on here may be compared favorably with the work done in many of our state experiment stations in America.

The Channel Islands

An interesting study in the development of breeds of live stock is to be found on the Channel Islands. These islands, the home of the Jersey and Guernsey, are located off the coast of France, but are under the British rule. Jersey Island, the home of the cattle by this name, is the largest of the group. Guernsey is the next in size and is the home of the Guernsey cattle. Guernsey cattle are also found on the Island of Alderney and Sark.

The trip from England across the British Channel to the Channel Islands must of necessity be made during the day time. The heavy fogs that prevail at many seasons of the year make navigation very difficult. As we approached Guernsey, large jagged rocks were to be seen. These perilous waters have been the scene of many very serious wrecks. The boats bound for the islands first dock at Guernsey and thence to Jersey. If the fogs fail to clear up before the boats get near the island they anchor off the coast until conditions are favorable for approaching the harbor with safety. Often the boats lie outside the harbor all night because of their inability to land with safety before night fall. Many people from England spend their "holidays" or vacation on the islands. Jersey seems to be the most popular island for the resorters.

On landing at the pier in Guernsey I saw great stacks of baskets filled with tomatoes ready to be shipped to England. Some breeders in America have the impression that these islands depend largely upon the income from their cattle for their existence. Such is not the case, but they depend upon the products of the soil, such as potatoes, tomatoes, grapes, figs, pears, peaches, and many other truck crops for their principal income. The great productiveness of the tilled land, which amounts to $300 to $400 per acre, is largely due to the use of greenhouses and hot beds. Flowers and bulbs are grown in great quantity; one is impressed with the variety of blossoms of all kinds of flowering plants.

The land sells for $1,000 to $1,200 per acre and rents from $50 to $60 per acre per year. The cattle can be seen tethered in small pasture lots all over the island. The pastures consist of a mixture of alfalfa, clover, rye, and grass. Other crops, such as oats and vetch, furnish pasture. The maximum feed is obtained by the system of tethering the cattle. The animals are moved several times a day but only a few feet at a time. Consequently, very little pasture is trampled under foot. During the winter months hay and roots make up practically the entire ration.

On Guernsey, as in some sections of England and Scotland, one gets the impression that little effort is being made to improve the cattle as compared with the improvement being made in America. On account of the heavy demand for Guernseys for export to America and England many breeders on Guernsey have sold the best cattle from their herds and the effect of this practice is quite noticeable. It is possible to get a price on any animal and it may be fairly stated that this practice is responsible for America as well as England having better conformed and higher producing cattle of the breed than are to be found on Guernsey.

Is Hoard's Dairyman a real help to you? Why not tell your neighbor about it? The good things we share with others are the things we most enjoy. Get up a little club of subscribers—now—and send them in.

Jersey Bull Calves

We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

Life and Wealth

An insurance company vouches for the accuracy of the following rather interesting compilation from government statistics:

Out of every one hundred men starting in life at age twenty-five, at age sixty-five one is wealthy, four are well-to-do, five live on their earnings, fifty-four are dependent on the charity of relatives, friends, or the public, and thirty-six are dead.

Out of one hundred men of all ages, when they die, three leave $10,000 or over, fifteen leave from $2,000 to $10,000, eighty-two leave no income-producing estate with the result that of every one hundred widows only eighteen are left in comfortable circumstances.

Out of one hundred children finishing the fifth grade in grammar school, eighty-three finish the sixth grade, seventy-one finish the seventh grade, sixty-three finish the eighth grade, thirty-four finish first year high school, twenty-four finish second year high school, eighteen finish the third year high school, and thirteen finish the fourth year of high school. Of this same one hundred children, seven finish first year college, five finish second year college, three finish third year college, and only two finish fourth year college.

MARSH FARM GUERNSEYS
Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.
MARSH FARM - - - Waterloo, Iowa

EL JANE GUERNSEYS ARCADIA, MISSOURI
(85 miles south of St. Louis)
Not the largest herd but an exclusive herd of pure-breds. Every cow with a record, now on test, or in preparation for test.
Mr. Farmer, Dairyman, or Breeder, anywhere, take notice!
BULL SALE — Since our last dispersal of bulls we have accumulated 7 that are now ready for any kind of service. We also have 6 calves. These animals are from high producing dams with records. Ten of these animals will go well in show ring. You will want one for fall service. We want to dispose of them NOW. Tell us the age you want, what you want to pay. We will send you pedigree and price list. Our proposition is 25% discount next thirty days on serviceable bulls, and 20% discount on calves. Also have several well bred young cows. Let us both make some money by buying NOW at the right price.

High Class Bull Calf

Falstaff's Wyoming of Upland Farms 68406
This calf is not priced cheap but he is well worth what we are asking for him. He is sired by Langwater Stargazer who is a son of Langwater Steadfast and out of Langwater Crystal. He is out of Falstaff's Wyoming of Upland Farms, a cow that has steady producing ability. Her records are: **9445.6 lbs. milk, 443.03 lbs. fat as two year old and 14748.8 lbs. milk, 679.26 lbs. fat Class A.** You want a bull at the head of your herd that comes from producing families. This calf is hard to equal. Write for price and description.
FLORHAM FARM, R. H. ALLEN, Manager, MADISON, NEW JERSEY

GOODHAND KINGSTON & SON'S
Guernseys Offered at Private Treaty
Because we have recently sold our farm and are breaking up partnership, we are forced to sell our entire herd. It includes 15 cows—most of them with A. R. records. Ten of their daughters by Imp. Itchen May King and 5 sons from a few weeks to 12 months old.
A 60-day retest on all animals and every one guaranteed a breeder.
This herd has been shown at state fairs and national dairy shows with credit for eight years.
Write or wire and we will meet interested visitors at Milwaukee or Waukesha.

110 Pure Bred Holsteins -- 50 Heavy Milking Grades

PRODUCTION—The pure bred cows of milking age have practically all made good year records under ordinary dairy conditions, milking two or three times a day and with no forcing. Many of them have large seven-day records as well. The grades milk from 60 lbs. up daily when fresh. They are good, profitable cows, sired by our good pure bred sires.

HEALTH—The herd has been under State and Federal Supervision for some years and the last two tests were 100% clean. We believe the herd to be absolutely clean and are so guaranteeing it. Our Retest Guaranty has no strings attached. Take your purchases home. Test them again within sixty days. If they react and lesions are found, purchase price will be refunded, less the value of the carcass.

Western Wis. Holstein Breeders' Ass'n CONSIGNMENT SALE

300 HEAD Of Choice Registered HOLSTEINS

The largest sale of this breed ever held

West Salem, Wis. WEDNESDAY and THURSDAY . . **October 29-30**

SALE BEGINS AT 10 A. M. SHARP EACH DAY.

Representing the best blood lines — including Ormsbys, Homesteads, Colanthas, Segis, Korndyke, and all other popular strains

THE CONSIGNMENT—Represents the choice individuals from over 80 herds in Western Wisconsin. All animals consigned are selected by an appointed sale committee and only animals that are large, well marked, choicely bred and heavy producers or from heavy producing ancestry have been accepted. Prize winners at Wisconsin State Fair and the recent National Dairy Show included. Foundation herd material will be available in any number.

THE FEMALES—(270 head) range in age from 18 months to 8 years, and many of the cows have large A. R. records. Others are on test now and 100 head are heavy springers. Fifty just fresh.

THE BULLS—(30 head) ages from 8 months to 6 years, are splendid herd header material. Several have been prominent winners on show circuit this year, and all are out of high producing dams.

HEALTH OF ANIMALS—All animals tested by an accredited veterinarian just previous to sale, and individual health certificates furnished with each animal.

A 30-lb. Bull

At a Bargain Price

King Pontiac Segis Lad De Kol 3d is 2 years old and the sire of some very promising calves. He was second among 25 calves at the 1922 Michigan State Fair and this year he was a prize winner as a 2-yr.-old. His dam made 30 lbs. butter from 700 lbs. milk in 7 days and his sire is a son of Sadie Gerben Hengerveld De Kol, 40 lbs. butter, 782 lbs. milk in 7 days, 157 lbs. butter, 3465 lbs. milk in 30 days. Sold subject to 60-day retest guarantee. Write today.

BAYNEWOOD FARMS, Romeo, Michigan

Wabeek Farm Holsteins

Foundation Females For Sale

We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

WABEEK FARM, Harry Mather, Mgr.
R. 3, PONTIAC MICHIGAN

Grahamholm Colantha Lad 297376

Senior Sire in the Newberry State Hospital Herd

HIS SIRE was first prize aged bull at the 1921 National Dairy Show.

HIS SISTER holds a World's Record as a senior 4-year-old. She produced 1,426.75 lbs. butter and 34,291.8 lbs. milk in 365 days.

ANOTHER SISTER has a record of 1,238 lbs. butter and 33,100 lbs. milk in a year and will soon finish another phenomenal record.

HIS DAM is a 35-lb. granddaughter of King Segis with a year record of 919.78 lbs. butter and 21,574.9 lbs. milk.

A FEW OF HIS BULL CALVES FOR SALE.

Send for our List of Bulls from Michigan State Herds.

BUREAU OF ANIMAL INDUSTRY, Dept. B, LANSING, MICH.

Detroit Creamery Co. Holsteins

Sir Hengerveld Pietertje Ormsby, Sr. Sire

A grand champion bull whose daughters prove him one of the really good present day sires. He is a double grandson of S. P. O. M. His dam, Chloe Pietertje Ormsby, has 4 yearly records that average 1,048 lbs. butter. We can now offer a few bull calves by him and from 7-day and year record dams.

We Are Offering For Sale

a 6-months-old bull whose dam, a 29-lb. 2-year-old, is now on year test as a 4-year-old with 514 lbs. butter in 4½ months. She is a granddaughter of May Echo Sylvia. His sire is a son of Jemima Johanna Segis, 1,175 lbs. butter as a 4-year-old.

The new ARCOLA

The Ideal Boiler for homes without cellars

Five reasons for installing ARCOLA at once

COMFORT. ARCOLA sends its hot-water warmth through small pipes to a radiator in each room. No cold spots or hot spots.

HEALTH. Even, genial radiator warmth means better health for every member of the family.

ECONOMY. The water-cooled, air-tight ash-pit makes possible ARCOLA's automatic heat control. This insures maximum warmth from minimum fuel.

ATTRACTIVENESS. ARCOLA's glistening enameled jacket will not stain, is easily cleaned, and is an ornament in any room. And through the pyrex glass panels in the fire door the hot coals glow with the genial friendliness of an open fire.

INVESTMENT. Any real estate man will tell you that hot-water radiator warmth will add much more than its cost to the selling value of your home. And you can buy it for only a few dollars down.

See ARCOLA in the store of your Heating Contractor today. He is our distributor.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

"AND now the evening comes, and something of a time to rest and listen. The scudding clouds conceal the half and then reveal the whole of the moonlit beauty of the night."

Volume LXVIII, No. 15 Fort Atkinson, Wisconsin October 24, 1924

"I would quit the dairy business if I couldn't have a De Laval Milker"--

Not one but hundreds of De Laval Milker users have made this and similar statements, such as:

—"the best investment I ever made."

—"the most profitable equipment on the farm."

—"I wouldn't sell it for twice the price."

—"makes dairying a pleasure instead of drudgery."

Strong words, and yet none too strong when you know what a De Laval Milker will really do.

How much wheat, corn or any other crop would be raised in the country if they had to be produced by hand? Not much. And yet the annual milk crop is more valuable than any other single farm crop. Then why milk by hand when a De Laval Milker will do the work better, faster, cheaper and cleaner, to say nothing of making dairying more pleasant and profitable? You are paying for a De Laval and not getting it by continuing to milk by hand.

Sold on easy terms so that it will pay for itself. Send for complete information.

Churches Co-operate in Promoting Health

IN a recent milk-for-health campaign which was conducted in one of the southern states, the ministers of the churches co-operated in encouraging the use of milk for health. The church as an institution is coming more and more to realize the value of physical health in religion. Rev. Everett S. Smith of Kentucky preached one of the sermons in connection with this milk-for-health campaign and is in part as follows:

"And the second is like, namely this, Thou shalt love thy neighbor as thyself."—Mark 12:31.

We are commanded to love our neighbors as ourselves. From the way the most of us treat ourselves today, I wonder if our neighbors would be altogether pleased.

We no longer mutilate the body as do the heathen still, nor do we curry favor with God by bodily abuse as did the monks of old, yet the present tendency toward the opposite of asceticism is fraught with grave dangers. Our task is to find the happy medium between overindulgence and overabuse, properly relate our bodies to our other selves, and hold for the body that sacred regard which it was ordained to receive.

I want to mention here just a few of the many very unusual diseases with which we are afflicted in this day. Of course I do not refer to diseases (though unusual) which are evident to the medical world, but rather to afflictions which are not commonly regarded as diseases, but which, nevertheless, may be so treated in such a treatise as this.

First—Routine. Here is a modern disease. Many are afflicted. Mark Twain's diary gives us a hint: "Got up, washed, went to bed." Routine involves habit. Habit may be a pernicious disease. One of the secrets of contentment is the art of making routine agreeable. We must eat and sleep, wash and sweep, get the children to school, open the mail, feed the bird or the dog, put out the cat, lock the doors—daily inevitables. Since there is no escape from these things that constitute the major part of our daily existence, why can we not arrange them so as to make them pleasant? We can, by changing ourselves. Routine taxes our physical endurance unduly. We sacrifice the satisfaction of regular physical requirements to routine. False stimulants are sought and our health impaired. We fret—we grumble—we have a headache. The cause is routine—habit—groove—rut. If we are caged, it does no good to flutter against the bars; better hop up on the perch and sing awhile and drink a glass of milk. That's what a song is for, to lighten labor. The washboard or egg beater will furnish a splendid accompaniment to a song like—"Pack up your troubles in your old kit-bag, And smile, smile, smile". That's what a glass of milk is for, to strengthen the body and furnish wholesome brain food to prevent fretting and worry. It is so much better than to excite the nerves with a stimulant and make drunk the brain to the extent that we imagine our body has been properly fed.

Second—Discouragement. Here is another modern disease. When one is discouraged, he is sick, he should take something. When we analyze discouragement we find it is nothing more or less than being sorry for one's self. Wallowing self-pity is a pitiable situation. I wonder if the physical self is in any way responsible for this condition.

Discouragement usually takes place when things go against us. It is often caused by expecting too much or what we have no right to expect. Again, it may be caused by perverted habit. We get into the way of looking for knocks and shocks and out of the way of looking for the very elements that will prevent discouragement. When our muscles are strong and elastic, our spine straight, our chest expanded, and our blood rich and red—gloom will take wings and fly away. "Laugh and grow fat" is a familiar expression. Let's reverse it —"Grow fat and laugh". Why does a fat person always seem to be jolly? There must be a reason for this happy disposition and about nine times out of ten, it is a healthy body. When we have protein for the muscles and other tissues, fat and sugar for body fuel, minerals for bones, and vitamins essential to growth and health, all in proper and proportionate quantity, I imagine we can wage a more successful war on the army of "Glooms", form an alliance with "Joys", and laugh at many stalking pestilences that now affright us. Then, too, I am confident that we could make quick riddance of the nasty disposition germs that now infect us. I am informed that milk is unique in containing all of the above mentioned body foods.

Third—Crustaceanitis. Pardon me, I coined this term. Some professor, somewhere, said that human beings may be divided into two classes, vertebrates and crustaceans. Crustaceans are animals that have an outer shell as a means of defense against their neighbors who want to eat them. They are helpless creatures that lie along a river bed and waddle about in search of a precarious livelihood. Vertebrates, however, have no shell of protection and carry their bony structure concealed within the flesh. They must fight or run if they be spared. Dr. Frank Crane says: "Life is pretty much a war. To exist is to struggle. And when you quit the fight, other organisms speedily devour you."

By "Crustaceanitis" I mean that attempt on the part of parents, inspired by a whimsical, sentimental attitude, to make helpless crustaceans of their children by pampering them and discouraging that vigorous exercise and active participation in athletics which is a great secret of good health. Regular human beings —vertebrates—want to be strong. They don't want to be "Mussels"; they want muscles. I quote from Dr. Crane again—"God never made a man in the likeness of an oyster, a crab, or clam. His life happiness and the salvation of his immortal soul do not depend on surrounding him with conventions, herding him into institutions, or looking him up in retreats. His best defense is his vitality, His safety lies in his punch. His life is better conserved by health than by pills. The good people of this earth are not those who are afraid to do wrong, but those who dare to do right."

It requires a good, clean, strong, healthy body to substantiate the will in daring to do right. All too frequently have we excused our mistakes on the flimsy basis of "The spirit is willing but the flesh is weak". The Vertebrate Paul said to the Vertebrate Timothy, "Thou therefore endure hardness as a good soldier of Christ". We sing "Onward Christian Soldiers", but how often do we pause to consider the metaphor of a Christian soldier? What was it that prevented millions of our American boys from being admitted to our army in the recent World War? Physical unfitness! Thousands volunteered, thousands were drafted that were rejected. Malnutrition, crustaceanitis, physical impurity, and scores of other preventable conditions were responsible for this rejection. I personally witnessed the examination of numbers of men in different camps, and the variety of physical defects due to preventable diseases was appalling. When shall we come to a realization and appreciation of "the house we live in"? Secretary of State Hughes in a recent welcome address in Washington City, said, "Diplomacy is the art of distributing the milk of human kindness." I wonder if we cannot twist this beautiful

(Continued on page 467)

TYPICAL WESTERN OREGON SCENE—READY TO UNHITCH AT NIGHT

Producing Limestone in Iowa

FIVE years ago not many men in Jackson County, Iowa, thought in terms of dollars and cents concerning the great quantities of limestone to be found there. It is true that a few men at that time were giving limestone a trial with sweet clover and alfalfa. Even today a few men scoff at the idea of hauling "rock" on to the land when it is already scattered all over the county.

It has taken well planned, hard hitting, thorough demonstration to change the attitude of a large number of farmers favorably towards this potentially valuable resource. A series of demonstrations under the direction of the county farm bureau during the past three years has made rapid progress toward a large use of limestone. In fact, if one were to measure the results of this demonstration work in terms of the number of samples of soil and limestone being tested each month by the county agent, one would know that many farmers are thinking of limestone in terms of what it will mean to their pocket books.

Jackson County is surrounded by, rather than served by, railroads. For this reason the production and distribution of limestone has become a greater problem than that of demonstrating the value of it. Many farms are several miles from a railroad and must go over hilly roads to reach railroad stations. On the other hand, each of the 18 townships has several to many deposits of high grade limestone easily quarried. The small to medium sized portable pulverizer has, therefore, gained admission to the county and is rapidly becoming popular, especially among farmers who otherwise would have a long haul. During the spring of 1924, four such pulverizers started operation in the county. According to later inquiry and interest, there will be several more such machines in operation during the coming year.

None of these machines are on the company or co-operative plan. One of them is owned by three individuals in a community and operates largely for their own use although the demand for pulverizing for others has been so insistent that the owners are yielding and are doing some outside work. In another community the pulverizer is owned by one man and the tractor by a near neighbor. The other two machines are owned by individuals and operated almost entirely on a commercial basis.

Production costs are found to range from $1.75 to $2.25 per ton when everything is charged against the product. Larger commercial concerns are at present able to deliver screenings and some deliver pulverized limestone to railroad stations for less than this price. Those near railroad stations, as a rule, are buying from the larger companies but those who have a haul of 3 miles or more and who are near good limestone are becoming interested in the "pulverizing at home" practice.

THIS PULVERIZER PRODUCED NEARLY 800 TONS OF LIMESTONE LAST SPRING. IT WAS OPERATED BY J. H. SCHUSTER, IOWA

The pulverizers used vary in capacity from 3 to 5 tons per hour. A very high grade of limestone is being made by these machines. The 10—20 to 15—30 size tractors are giving good satisfaction.

Farmers are finding an added advantage where the limestone is pulverized either on their own farms or in the immediate community in that they can haul to better advantage. Most farmers are planning to get limestone to their farms in the fall season rather than depend on hauling in the spring when roads are soft.

About three thousand tons of high grade limestone have been produced by these machines during the past year. The problem of production and distribution is greater now than the problem of demonstrating the value of limestone.

Milwaukee Milk Producers' Association

BEFORE the Milwaukee Milk Producers' Association was organized, the producers supplying Milwaukee with milk received less for the whole milk delivered than the creameries one hundred miles away were paying their patrons for fat alone.

To produce fluid milk entails extra expense and the loss of skimmilk for feeding the young stock of the farm. It was but natural that producers selling milk under such circumstances would become very much dissatisfied with their market and when people become dissatisfied, and for a reason, they invariably take some action to improve their conditions. This is just what the producers did in the territory that supplied Milwaukee with milk. They selected as their leader the present secretary of their organization, Mr. G. R. Rice. Before any steps were taken to organize the producers, Mr. Rice held meetings in various sections of the territory for a period of five to six weeks and secured over 500 signers expressing their willingness to join an organization.

After the purpose and object of the organization was set forth to the producers, a meeting was called and the Milwaukee Milk Producers' Association was organized. The officers elected were E. S. Robbins, president; Charles Dineen, vice-president; G. R. Rice, secretary-treasurer. The milk distributors of Milwaukee viewed this movement with alarm, for they were fearful it would prove injurious to their business and disrupt their organizations, which is the case in most instances when people counsel with fear instead of courage.

The farmers also viewed the milk distributors with suspicion, and unfortunately this still exisits in the minds of some members of the Milwaukee Milk Producers' Association. At the bottom of this suspicion on both sides was ignorance and a fear that weakens instead of strengthens.

We doubt whether the milk distributors or producers fully appreciate that they are simply parts of a great industry and both are essential to its success. One cannot exist without the other and what will harm one will harm the other. But, as Mr. Rice has said, "We had to learn and to know each other. As we became acquainted we found there was no *harm* on either side as we feared there would be."

Certain practices among the distributors were detrimental to the producers and did not give them a square deal. The distributors see this now and have corrected it. In the first place, it is not fair to a producer of fluid milk to pay him no more than its butter value and neither was it fair to shut off producers when there was too much fluid milk for the market to absorb. In order to supply the necessary quantity of fluid milk, there will be seasons of surplus, and this cannot be prevented. But this surplus can be regulated, and through organization it has been regulated. Surplus, however, must be taken care of and the distributors are doing this now. This was one of the outstanding reasons for organizing the Milwaukee Milk Producers' Association. For a short time the association took care of its own surplus, but found this more expensive than their present plan of permitting the distributors to handle the surplus.

The agreement which the producers have with the dealers to take care of "homeless" milk is very satisfactory. Definite rules have been adopted to pay for what is termed "manufactured milk", meaning surplus milk or that which must be turned into some product like butter, cheese, or condensed milk. The value of surplus milk is calculated upon the price of 92-score butter in Chicago and the market value of skimmilk. On page 438 we publish the plan adopted by the Milwaukee milk dealers and the Milwaukee Milk Producers' Association to arrive at the price of surplus milk.

The arriving at the price of fluid milk is done at a price conference composed of both the dealers and the producers. It becomes a process of bargaining, taking into consideration the price of good butter and cheese, the value of skimmilk for feeding live stock, and prospective supply and demand. In other words, the committee in arriving at a price for fluid milk takes into consideration market conditions. The plan is working very satisfactorily, both to the producers and the dealers. Through these monthly contacts both sides have come to a definite conclusion that each can help the other and that each is a part of a great industry and that what will hurt one will injure the other.

Through organization, the producers are able to supply the distributors with all the fluid milk they require at a uniform price and this is an advantage to them, for there is a wide variation in the demands for fluid milk. There is also a wide variation in the production of milk, but where a large number are banded together to take care of the milk supply of a city, these variations do not become as troublesome or as expensive as when each farmer sold his milk separately. Some weeks ago we published the new plan for obtaining uniform production. In brief it is as follows:

"The average monthly production of each shipper during August, September, October, and November, 1924, shall be considered their base quantity.

"During the first six months of 1925 all producers will receive the regular 'Average price' for any amount up to one and one-half their base quantity. For all milk above this amount they will receive the 'Manufactured price'. For example: If a shipper has a base quantity of 10,000 pounds and ships 20,000 pounds, he would receive the 'Average price' for 15,000 pounds and the 'Manufactured price' for 5,000 pounds."

The prices received for fluid milk for the past three years, since the plan has been in operation, have been very satisfactory. Of course, the farmers desire more for their milk, but every thinking producer who knows market conditions and has given the matter any serious consideration knows that they have received full market price for their milk and there are few, if any, associations operated under similar conditions that have been able to get as much for milk.

One of the most discouraging and, we would say, unfortunate things about the work of the Milwaukee Milk Producers' Association is coming to know that only about 60% of the producers who supply Milwaukee with fluid milk support this organization. Some of them do not fully appreciate the good work it has done and is doing. It has been calculated by men who know that the average price paid for milk has been at least 15 cents a hundred higher since the association was formed than it would have been without this organization. This has meant an income of $275,000 a year; the cost to secure this income has been $10,000.

It is estimated that the price of market milk so far this year has been about forty cents a hundred higher than it would have been without this co-operative marketing association. There are men who know this and will admit it, but when asked to contribute their 3 cents per cwt. for carrying on the work, they have replied that it is unnecessary for them to spend any money for the support of the organization. This is downright dishonesty. We can forgive those who do not comprehend what the association has done and is doing, but we can't forgive those who know the association is doing good work and who receive its benefits without bearing any of the expense. This very thought and attitude is not only contemptible, but is what frequently disrupts farm organizations.

A few men are leaving the Milwaukee Milk Producers' Association to produce special milk. These men are

(Continued on page 463)

SAY IT WITH DOLLARS

D. D. OFFRINGA, IOWA

MR. FRANK A. CHESTER AND HIS THREE SONS: RALPH, ELMER, AND NATHAN

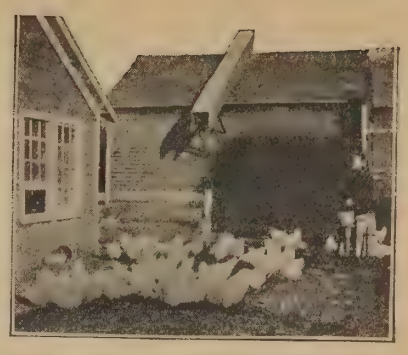
NET incomes of from $4,500 to $6,900 have been rather scarce these last four years and any farmer that can show income tax reports to that effect, ought to have a chance to tell others how he did it. That's why I was interested in finding out the why and the how of the success of F. A. Chester, prominent dairyman, hog raiser, and business man of Iowa. The businessman, in this instance, means a real dirt farmer who puts business principles into his farm operations and makes it pay.

My opportunity to learn of his methods came when I visited him some time ago to assist the new tester of the Bremer County Cow Testing Association in getting properly started. Mr. Chester is the president of this association. On this particular day the last samples to finish the second year's work of the association were taken.

During 1923 the Chester herd was first in the state of Iowa, with an average production of 405 lbs. butterfat out of 10,640 lbs. milk. The finish of the second year's work showed an average production of 458.39 lbs. butterfat out of 11,961 lbs. milk, which was higher than any previous record ever made by any herd in any cow testing association in Iowa. The best previous record of any herd of 10 cows made in Iowa was 443 lbs. butterfat. Making a state record is in itself quite an achievement but when this is made under conditions that can be followed by any practical farmer, it is all the more remarkable.

One of the outstanding points about the record was the fact that four of the 10 cows that completed at least nine months of testing were grade Brown Swiss. One of them, "Ulga", produced 639.8 lbs. fat out of 15,050 lbs. milk. This is the highest record made by any cow in the Bremer County Cow Testing Association, and also gives her first place for two years, as for the two years combined she produced 1,154 lbs. fat out of 27,612 lbs. milk. Her three half sisters produced an average of 48.31 lbs. butterfat. The four cows are all daughters of a pure-bred Brown Swiss sire that was purchased by Mr. Chester when he first decided to become a dairyman.

Back of all this success with the dairy business is a very interesting story. Fifteen years ago, Mr. Chester was a business man in Illinois. He thought he saw greater opportunities in farming as this would give him a healthier life and his four boys and two girls the best place in the world to be reared. It was not primarily for better financial opportunities, as he was a very successful business man. He decided to move to Iowa where he bought a 200-acre farm.



Following the custom of the community, he started milking cows, using the type of cows that were popular milkers. His business experience told him at once that he could not afford to keep any boarders. Not being able to join any cow testing association, he decided to do the testing himself. The results certainly justified the trouble of doing the work.

After looking over the records of his 14 cows, he found that they produced an average of 150 lbs. butterfat. This was in 1911. He kept on testing his cows, eliminating the poorest and improving his feeding methods. In 1912 he had one cow that, through careful and regular feeding and management, produced 300 lbs. fat. If it was possible to have one such cow, it was possible to have an entire herd produce an average of 300 lbs. fat. Always keeping posted through a number of the best farm papers, he decided that he would have to start with a pure-bred sire of a dairy breed. He picked on the breed that was in his judgment the nearest a beef breed and still was classified as a dairy breed. The pure-bred Brown Swiss sire which was used on his herd of mixed cows was his first step in herd improvement by better breeding. Considering the remarkable records made by the only four remaining daughters of that sire that are still in the Chester herd, it is but another case amongst thousands of a good sire that was sent to the butcher before his worth was detected.

However, Mr. Chester decided to go just one step further than most of his neighbors and bought a pure-bred Holstein cow and a pure-bred Holstein sire. Always taking every precaution to do everything in a practical way, he decided to "grow" rather than "go" in the dairy business. From a rather slow start, he has developed a herd of pure-bred Holstein-Friesian cows that rank amongst the best in Iowa. His way of doing business is worth studying and following, because it involves a few risks and guarantees sure profits. And profits are the items that have counted in recent years.

"Mr. Chester, what do you really consider the outstanding reason for your success as a dairyman?" I asked him. "Well, there really are a number of reasons," he said, "but I felt that it was my job to get acquainted with every one of my cows. To do this I did the testing myself but found it hard to keep it up permanently. When I joined the cow testing association later on, I found that these associations are nearly as much a test for the man in charge of the herd as it is for the cows themselves. It sure showed me where we stood regarding the feed, care, and management of our herd. I was always fairly well pleased with the kind of feed I was feeding my cows. The roughage consisted of silage and a clover-timothy mixture. The grain ration consisted of 200 lbs. corn and cob meal, 200 lbs. ground oats, 100 lbs. bran, 100 lbs. oil meal, and 100 lbs. cottonseed meal. Since belonging to a cow testing association, I have come to the conclusion that it is much better to feed alfalfa hay and that's why I bought that carload of limestone. It is going to be used as a means of sweetening the soil and I am going to grow my own protein in the form of alfalfa.

"I believe, further, that it is a mighty good thing to be just as prompt about dairy work as possible. We are just as regular as we can be both night and morning. I have always believed in giving the cows heated water, rather than ice water during the winter time. We try to make it comfortable for the cows without ever getting away from the practical side of the question. You may agree with me or not, but I object to three times per day milking from that standpoint alone. Our records might have been bigger but I doubt if the profits would have been bigger. And it is profits rather than records that we are after."

MRS. F. A. CHESTER AND HER FLOCK OF WHITE ROCKS THAT BROUGHT HER $532.50 LAST YEAR

Talking about profits one would think that the dairy business was quite the thing on the Chester farm. "You consider yourself primarily a dairyman, I take it, Mr. Chester." "Well," he said, "our hogs have brought us big money even these last few years. I would consider them at least as important as dairy cows on my farm but they make a combination that is hard to beat. I use a self feeder and the hogs eat all the shelled corn they want. I feed them a mixture of 100 lbs. tankage, 100 lbs. acid phosphate, 50 lbs. limerock, 50 lbs. wood ashes, and 15 lbs. salt, both as a general feed and mineral combined. Last year our hogs brought us $4,571.96 gross, while the total net income from the farm amounted to $4,518.65."

While we were discussing dairy cows and hogs, the subject of the chickens was brought up. "You better ask Mrs. Chester concerning the chickens," he said, "as she has entire charge of that and I cannot tell you much about them, except that they brought us a gross profit of $532.50 last year."

"The only thing I can report," said Mrs. Chester, "is that my chickens get sour milk the year around; they get oats in the morning and they have a dry mash consisting of ground oats, ground corn, bran, tankage, flour middlings, and salt in front of them all the time. I gather the eggs promptly every day and cull the poor chickens during the summer."

In addition to having met with a large measure of success as concerns the live stock industry, Mr. Chester has shown practical ideas in many ways about the farmstead. One is impressed with the large concrete yard which was built with the specific purpose of retaining all the value of the barnyard manure. The five-foot high concrete wall which surrounds the yard is not only built for permanency but serves as a remarkable windbreak. It is an original idea of Mr. Chester and he is convinced

(Continued on page 466)

FOUR BROWN SWISS GRADES

These cows are daughters of the same sire and part of the herd of F. A. Chester & Sons of Iowa. In the Bremer County Cow Testing Association last year they averaged 522 lbs. fat—Ulga made 639.8 lbs.; Brindle, 531.8 lbs.; Spot, 490.2 lbs.; and Blackey, 427.3 lbs. In the background is shown the 5-ft. concrete barnyard fence and windbreak.

THE CHESTER HOME

Everything is just as practical for Mrs. Chester as the arrangement of the barn is convenient for the men folks.

HERE ARE EIGHT OF THE TEN COWS IN THE CHESTER HERD THAT COMPLETED AT LEAST NINE MONTHS OF TESTING

Their average production of butterfat is 502.4 lbs. in a year.

THE CHESTER BARN

A most conveniently arranged home for 22 cows in two rows of stanchions, with room left for two box stalls and three grain bins.

NEW YORK EXPERIMENT STATION JERSEYS

Two Versus Three Milkings

A. C. DAHLBERG, NEW YORK

IF you had a herd of 26 registered Jersey cows that were milked and fed twice daily and they produced an average of 375 lbs. fat in eleven months and a calf in thirteen months, how much would these cows produce if they were milked and fed three times per day and placed on Register of Merit test for class AA? In class AA the cows are milked for twelve months and must give birth to a living calf in less than 16 months from the previous calving. This question was asked of half a dozen men who were in charge of Jersey and Guernsey cattle at the National Dairy Show in 1922.

The variations in the replies were startling. The most conservative man was a Jersey breeder who stated that the production of these cattle was too low to warrant milking three times per day. He believed that an increase in production would result from the extra month of milking and a longer dry period but that this increase would not exceed 50 lbs. fat per year making a total production of 425 lbs. fat per year. The most optimistic breeder had Guernsey cattle and he was positive that under his system of feeding and management the herd in question could be made to produce in excess of 600 lbs. fat per year.

A number of experiments have been finished to give information on this point but most of them have not covered sufficient time or enough animals to furnish conclusive evidence. It has, however, usually been recommended that Jersey and Guernsey cows giving 30—35 lbs. of milk per day should be milked and fed three times and that Holstein and Ayrshire cows giving 40 lbs. per day should be milked and fed three times per day. Mature Jerseys in the Station herd give 30 to 40 lbs. per day when fresh and should, accordingly, be milked three times per day.

On November 1, 1922, the Station herd was placed upon an experiment to determine the increase in milk and butter production that might be expected as a result of milking and feeding such cows three times per day. Although the experiment has been in progress for 16 months, this report must be given only as a progress report because the test is not yet complete. The time has been too short and the animals used too few to warrant final conclusions.

For the purpose of this experiment all the cows in the barn were divided into two groups. Mature cows were selected upon the basis of type and past production records. All heifers were and are being selected upon the basis of type and their record for 10 months as junior two-year-olds. In this way the two groups are maintained as nearly uniform as possible. One group is fed and milked twice daily. This group is milked ten months per lactation year and is bred to freshen every 12 months. They are milked regularly at 11½- and 13½-hour intervals. This group is handled in a way comparable with that of the average dairy cow. The second group is milked and fed three times per day. The cows in this group are milked for 12 months per lactation year and bred to freshen every fifteen months. They are milked regularly at nine-, seven-, and eight-hour intervals. This group is handled in a way comparable with that of the pure-bred breeder making yearly test records. After an animal is placed in one group or the other she remains there for the rest of her life or until she has reached maturity. In this way the cumulative effect of the two systems of handling will be obtained.

Two inaccuracies are at once evident in this experiment. The production of a mature cow cannot be accurately predicted by her type and record as a junior two-year-old. No method more accurate is available and the best must be used in spite of its failure to give absolute accuracy. The second possible error will be encountered in comparing the records due to the fact that the length of lactation and rest periods vary. Since this variation is usually encountered it was introduced to show the effect of this treatment as well as the two versus three milkings and feedings.

RUFUS OXFORD CAREY B B

This cow produced an average of 344 lbs. fat per year on two milkings. When six years old she gave 489 lbs. on three milkings per day and is now making a record in excess of 600 lbs. fat.

Immediate Effect of Three Milkings and Feedings

The immediate effect of three milkings and feedings upon the milk and butterfat production was evident as soon as the experiment started. The cattle ate their first grain feed at night without relish and much of it was removed from the mangers on the following morning. The consumption of hay was also very slight. This failure to consume their feed probably indicated two conditions. The cattle were receiving plenty of food nutrients in two feeds per day, and feeding standards confirm this statement. The second condition indicated by this failure to consume their feed was a reiteration of the old statement that the dairy cow is a creature of habit. Experience with the Station herd has demonstrated that if the third feed of grain had been divided between and added to the two regular grain feeds the cattle would have eaten it with relish. After one to four weeks the cattle had become accustomed to the extra feedings at night and they expected it.

How hard those cows milked the first time they were milked at night! For fully a minute one cow failed to give any milk and all milked very slowly. It should be stated that all cows were milked by machine and have been so milked since 1907. The cows adjusted themselves slower to the extra milking than they did to the extra feeding. The slowness and hardness of milking rather than the amount of milk obtained is the basis of this conclusion.

Comparisons of milk and butterfat production given in Tables 1 and 2 include all cows in the barn not in the first or last month of their lactation period. The figures include the month before and the month after three feedings and milkings began. The cows fed three times daily received but a small quantity of grain in excess of those fed twice daily for the reason that they ate so little of the extra feed given to them. Table 1 gives the records of the cows milked three times per day and Table 2 which contains the records of the cows milked twice daily serves as a check upon the results given in Table 1. The yield of butterfat per cow per day for each group is about one pound, which is a fairly good average. Comparing the month of November with October, the yield of milk per cow per day for those cows milked three times per day increased 1.6 lbs. on three milkings and 1.7 for the cows milked twice daily. The fat yield of the cows milked thrice daily decreased 0.1 lb. per day and the cows milked twice daily also lost 0.1 lb. per day. It accidentally happened that a few of the cows showed variations in the milk test that were not continued throughout the lactation period. It is evident that three milkings and feedings per day had no immediate effect upon the milk flow of the Experiment Station Jersey Herd.

Table 1—Monthly Record of Cows Milked Thrice Daily

Cow No.	October, 1922 Last month of two milkings Milk Lbs.	Fat Lbs.	November, 1922 First month of three milkings Milk Lbs.	Fat Lbs.
2	697	36.2	667	33.7
5	522	29.7	430	24.1
6	328	17.3	303	16.0
9	542	27.6	480	25.2

24	1060	53.4	995	47.5
26	455	28.6	393	26.3
Ave. daily yield of 9 cows	20.5	1.1	18.9	1.0
Daily decrease per cow			1.6	.1

Table 2—Monthly Record of Cows Milked Twice Daily

Cow No.	October, 1922 Milk Lbs.	Fat Lbs.	November, 1922 Milk Lbs.	Fat Lbs.
7	776	35.9	663	29.1
11	525	27.8	436	25.9
12	447	27.5	411	28.6
16	492	29.0	430	24.1
21	472	24.8	423	25.1
23	831	44.0	755	33.2
Ave. daily yield of 6 cows	10.0	1.0	17.3	.9
Daily decrease per cow			1.7	.1

Accumulative Effect of Three Milkings and Feedings

It is more difficult to obtain results over a long period of time that are comparable than it is to obtain such results in periods of one week or a month. The data given in Tables III and IV do not necessarily contain comparable figures but rather the butterfat records of all the cows in the herd that have finished complete records on two and three milkings per day since November, 1922, when this experiment began. It is obvious that for numerous reasons certain production records could not be included. Butterfat yields in the tables might be considered as the results which a farmer might obtain if he had owned this herd of cattle and began milking and feeding them three times daily. The results apply only to the herd used for the years recorded in the table and they cannot be used for generalized statements because the data are insufficient. At some future time more exact results may be expected.

The tables give the number of lactation periods finished prior to November 1, 1922, on two milkings per day as well as the average yearly butterfat production and the age of the cow on that date. The last lactation period prior to this date is

(Continued on page 465)

EXPERIMENT FAIRY QUEEN

She produced 836 lbs. fat as a yearling on two milkings per day. As a senior two-year-old she was milked three times daily and produced 534 lbs. fat.

Alfalfa For Indiana Farms

There is no longer any doubt about the adaptation of alfalfa to Indiana conditions. The following are some of the principal points to be studied and observed in order to make a success of alfalfa culture:

Alfalfa is a deep-rooted plant of extensive feeding habits and for its best development requires a deep, mellow, and well drained soil. Good corn soils are good alfalfa soils, but almost any type of soil may be made to produce good alfalfa, provided it is well drained, abundantly supplied with decomposable organic matter, free of acidity, and well supplied with the mineral elements of plant food in available forms. For the first trial of alfalfa it is well to use the best field on the farm.

Good drainage is essential. Alfalfa roots will not develop in a waterlogged soil. If the soil is not naturally well drained, it should be tiled to a depth of at least three feet, and in heavy soils the lines of tile should be laid fairly close together. Soils that are subject to flooding for more than a couple of days at a time are not good for alfalfa.

Alfalfa will not thrive in an acid soil. It is more sensitive to acidity than any other of the common legumes. Where red clover fails alfalfa cannot be expected to thrive. If the soil is producing good clover it will usually grow alfalfa without liming. Where there is doubt, the soil should be tested for acidity, and if it is sour an application of some form of lime must be made. Ground limestone will usually be the most economical and most satisfactory form of lime to use. In most cases an application of two tons per acre, harrowed into the plowed soil, will be sufficient for several years. Where marl is available this is an excellent form of lime to use.

Organic Matter

A liberal supply of organic matter in the soil is especially necessary for several reasons. It loosens heavy soils, promotes aeration, prevents baking in dry weather, lessens injury from heaving, aids the water-retaining capacity of light soils, and supplies necessary food for bacteria. If sufficient stable manure is not available, a green crop, such as cowpeas, may be grown and plowed under in preparation for alfalfa.

When once properly inoculated with its particular nitrogen-gathering bacteria, alfalfa will get its nitrogen from the air and even enrich the soil in this element. For the mineral elements of plant food, it must depend upon the supplies in the soil like all other plants. Stable manure is especially valuable in starting an alfalfa field. It not only supplies available plant food, but the organic matter it contains improves the physical condition of the soil and promotes the development of the nitrogen-gathering bacteria.

Phosphoric acid and potash may be profitably supplied in the form of commercial fertilizer. On ordinary soils, most of which are poor in phosphoric acid and may need available potash, an initial application of 400 to 500 pounds per acre of a fertilizer containing about 10 to 12 per cent of phosphoric acid and about half as much potash should be made.

Three cuttings of alfalfa in a season, aggregating five tons of hay per acre, will remove 55 pounds of phosphoric acid and 200 pounds of potash from the soil. In most cases it will pay to apply, either in manure or fertilizer, nearly as much phosphoric acid as is removed in the hay. On loams and the heavier soils, which are well supplied with potash, only small amounts need to be returned, but on the lighter soils larger amounts must be returned in either manure or fertilizer.

Inoculation

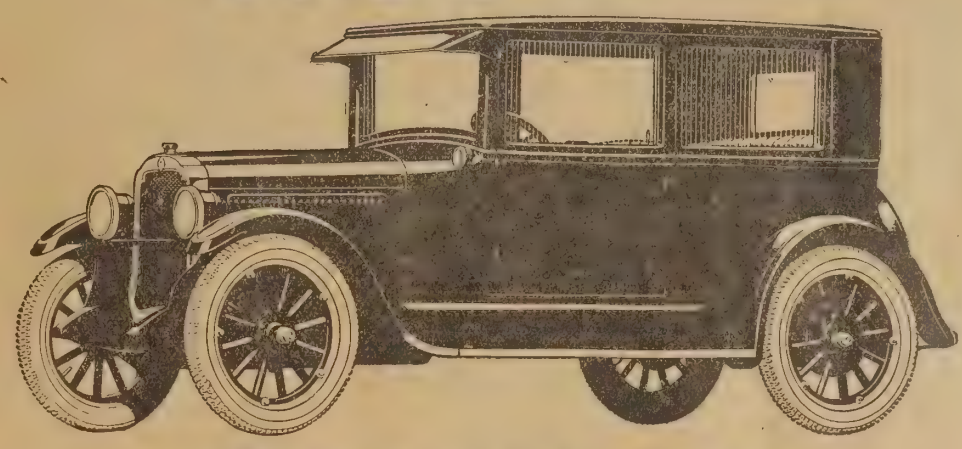
Where alfalfa is sown for the first time, the soil must usually be inoculated with the nitrogen-gathering bacteria peculiar to this plant. When the seed is to be drilled or harrowed in, the simplest and surest way to inoculate is to get some soil from an old alfalfa field or a sweet clover patch and mix three or four quarts of this with each bushel of alfalfa seed just before seeding. The seed should be moistened with a weak glue or sugar solution to make more soil adhere to each seed.

When seeding on wheat, inoculation may be effected by broadcasting 200 or 300 pounds per acre of inoculated soil after growth is well started. This should be done just before or during a rain. When inoculated soil is not available, commercial cultures can be secured from seedsmen or direct from bacteriological laboratories where they are produced. Directions for application accompany these cultures.

Seeding

Alfalfa may be seeded as clover is sown on winter wheat or rye, using 10 or 12 pounds of seed per acre. It is a good plan to sow half the seed on bare ground early in February and half in April after danger of freezing is past. It may also be sown with a drill in April, using about 8 pounds of seed and going crosswise of the wheat drills. For seeding alone, the most generally satisfactory time is early August on ground specially prepared after the removal of a June or early July harvested crop.

Grimm and Cossack are the most satisfactory varieties of alfalfa for Indiana on account of their ability to withstand winter injury. Their branching root systems make them especially resistant to injury from heaving. Pure, certified seed should be secured.



August seedings should usually not be cut, but should be left to die down for winter protection. Earlier seedings may need to be clipped once or twice during the season, according to the amount of trouble with weeds.—Purdue College of Agriculture.

"It is never too late to give up our prejudices. No way of thinking or doing, however ancient, can be trusted without proof."—THOREAU.

Money Saving Ideas
for Cow, Hog and Hen Farmers
Send Today for Your Copy

Of course you want bigger earnings from your dairy cows, hogs and poultry. The question is *"how to get them?"* This new Jamesway Book may have exactly the answer you need.

It is full of practical ideas, plans and suggestions that other farmers are using—*today*. It is written from experience, and contains only the kind of information that practical dairymen and farmers want. How to improve an old barn—How to get the right floor plan—How to save labor—How to handle the feeding and cleaning jobs, etc.

Send for this book. It is free. It tells you "how" you can install any Jamesway Equipment, steel stanchions, stalls, water cups, carriers, etc.—right now—on our "PAY-FROM-INCREASED-EARNINGS" Plan. Right in your county there is a Jamesway Man, who is able, capable and eager to help you. Our book will tell you how. Write today. Mail the coupon this instant to Dept. A

JAMES MFG. COMPANY

Jamesway

It Tells You

How to get a good dairy barn.
How to remodel an old barn.
How to get good ventilation.
The Essentials of a Good Cow Stall.
How to give cows pasture comfort in the barn.
How to judge a stanchion.
How to feed cows for profit.
How to insure "safety first" with the bull.
How to make the cleaning job easy.
How to water your cows in the barn.
How to have better hogs and bigger litters.
How to make more money from your hens.
How Jamesway "Pay-from-Earnings" Plan pays for your equipment as you use it.
And many other helpful pointers on cow, sow and hen problems.

Plan of Buying Milk for the Milwaukee Market

Adopted by the Milwaukee Milk Dealers and the Milwaukee Milk Producers' Association

1. Two classes shall be established in the Milwaukee Milk Market known as "Fluid Milk" and "Manufactured Milk". "Fluid Milk" is that which is sold in its natural state. Milk used for any other purpose whatsoever, shall be considered "Manufactured Milk".

2. The price of "Fluid Milk" shall be determined each month at a conference of the dealers and the agents of the Producers' Association.

3. The price of "Manufactured Milk" shall be determined by multiplying the butterfat test (as shown in paragraph 4) by the average Chicago quotation on nienty-two score butter (as reported by the U. S. Department of Agriculture) plus twenty per cent. Deduct the cost of manufacturing and selling (5c per pound butterfat.) To this is added the average value of the skimmilk and cottage cheese (as shown in paragraph 5.)

4. The following butterfat tests shall be used in determining the price of "Manufactured Milk".

January	3.55%
February	3.55%
March	3.50%
April	3.50%
May	3.40%
June	3.40%
July	3 50%
August	3.50%
September	3 55%
October	3.60%
November	3.60%
December	3.60%

5. Value of 100 lbs. skimmilk for manufacture into skimmilk powder.

Take the average quotation on high and low unknown brands (Bbls.) each day (as reported by the Producers Price Current, N. Y.) and average these for the month. Deduct the cost of manufacturing and selling (7c per pound) and multiply the balance by the yield per 100 lbs. skim (8 pounds).

Sweetened Condensed Skimmilk. Take the avergae quotation on high and low unknown brands (Bbls.) (as reported by the Producers Price Current N. Y.) and average these for the month. Deduct the cost of manufacturing and selling (two cents per pound) and the value of the sugar used 43-100 lb. at the average quotation and multiply the balance by the yield 100 lbs. skim (28.0 lbs.),

Cottage Cheese. Select five large jobbers of cottage cheese (to be named later). Take the average of each day of their high and low quotations (on good cheese in large irregular shipments) and average it for the month. Deduct the cost of manufacturing and selling (two cents per pound) and multiply the balance by the yield per 100 lbs. skim (13 pounds).

Average the value of skim for the three products and take eighty-five per cent of this as the value of skim in 100 lbs. of milk.

6. Each dealer shall determine the average price to be paid to his shippers by figuring what percentage of his total receipts was sold as "Fluid Milk" and what percentage was manufactured. He will then multiply the percentage of "Fluid Milk" by the price of "Fluid Milk" and the percentage of "Manufactured Milk" by the price of "Manufactured Milk". Adding these two figures together and dividing by one hundred will give the average price. The dealer shall then deduct one cent per hundred pounds which will be the farmers' contribution for advertising. This money shall be paid to the Wisconsin Dairy Council for advertising milk in the Milwaukee and adjacent markets. The dealers will contribute also the same amount to this advertising fund.

7. The dealers shall be permitted to take on shippers at the straight "Manufactured Price" using the shippers' actual test instead of the average test (as shown in paragraph 4) if they do not wish to put more shippers in the "Average Price" list. The name of such shippers shall be reported to the Producers' Association immediately when they start or stop or are transferred into the "Average Price" class. The amount of such milk shall be deducted from the total receipts before figuring the average price as stated in paragraph 6, and from the amount manufactured, as shown in paragraph 8.

8. Each dealer shall mail a report to the State Division of Markets not later than the 15th of the month, giving the following information concerning the previous month:

Total amount of milk purchased during the month.

Amount and percentage sold as "Fluid Milk".

Amount and percentage sold as "Manufactured".

Amount used in manufacture of each product.

Amount of each product manufactured.

Average price paid to producers.

Amount bought at manufactured price.

Amount of emergency milk purchased.

9. The director of the State Division of Markets and his assistants shall have free access to the dealers' books and records any time said director may choose to check the accuracy of the reports.

10. The figures used in manufacturing costs, yields, etc., as shown in paragraphs three and five may be changed when conditions warrant.

11. The dealers individually and collectively agree to accept so far as is possible, all milk of good quality offered from sources which are logically in the Milwaukee district.

12. All milk purchased directly from farmers shall be considered when determining the percentages of "Fluid Milk" and "Manufactured Milk". However, milk received at country plants may or may not be included at the option of each dealer, in the pounds of milk on which percentage is to be figured. Milk purchased from creameries, cheese factories, condenseries, or other buyers of milk, to protect the dealer against shortage of supply, shall be known as "Emergency Milk", and shall not be included in the pounds of milk in which percentage is to be figured, neither shall this "Emergency Milk" be deducted from the total pounds actually sold as "Fluid Milk". In the case of "Emergency Milk" between two distributors, the selling distributor shall include such milk in his total "Fluid Milk" sales. However, in case one distributor sells milk to another for the sole and only purpose of manufacturing, such milk shall be considered as "Manufactured Milk" by both distributors.

Mike—"Why do thim false eyes be made of glass?"

Pat—"Shure, an' how could they see thru thim if they wasn't?"

Importance of Uniform Quality of Cheese

HOARD'S DAIRYMAN:—I am proud of the cheese industry of the State of Wisconsin. I am thankful to the Divine Providence that permitted me to be born in that grand old state. Wisconsin is proud and justly so of the fact that she produces over 400,000,000 pounds of cheese annually or representing in dollars and cents over $100,000,000 annually. Of this output about 275,000,000 pounds are American Cheddar cheese. It has been truthfully said that the dairy industry produces more new wealth than any other with which it may be compared. It has been said that Wisconsin's cheese production would annually make a tunnel of cheese 30 feet wide with roof extending from Chicago to Milwaukee.

However, in spite of this prosperity, how much greater could that prosperity be and the price for dairy products increased if we could only attain one goal and that uniformity. A small word of only ten letters, but it means a whale of a lot to the cheese industry. Coming through the darkness one thing has come to assist the dairy farmer to a light of a better day. This is loaf cheese.

So important is loaf cheese as a commodity, that a certain degree of opposition can naturally be expected. As far as the public is concerned, it is highly pleased with loaf cheese. The best evidence of the popularity of loaf cheese is in the volume of sales running into the millions of pounds. One of the loaf manufacturers and the one that is most successful manufactures five hundred 350-lb. batches or 175,000 pounds of loaf cheese daily. That is exactly what they are making at the present moment and what the orders call for.

One of the most crying needs of the cheese industry of today is uniformity. It is and always will be impossible to get a definite method of manufacturing cheese in the 2,800 cheese factories of Wisconsin. If we take into consideration the differences produced by the seasonal changes or variations and curing, any student of cheese, familiar with marketing conditions, will readily affirm that the need of uniformity in cheese is really the big stepping stone to success.

Another need in the cheese business is a cured cheese. You go to town and buy a pound of cheese and if it is exactly what you like, you go back for another pound of the same. Another cheese is on the counter; the dealer assures you it is equally good. When you get your pound home you find it is as different as day from night and you do not like it. The greater part of the pound is thrown away; you are disgusted with cheese. The flavor of loaf cheese is always the same; as a result, you know what you are getting. There is nothing to attract the consumer to a tough, rubbery green cheese. The big drawing card of cheese, flavor and aroma, is entirely lost. Cheese more than any other food is eaten for flavor. I know from my own experience that there is entirely too much green bulk cheese on the market today.

Loaf cheese is made by the reheating of commercial or bulk cheese up to a pasteurizing temperature. Pasteurizing the cheese just before it is ready for consumption is the best method yet devised for the solving of the pasteurizing problem for this dairy product, for the following reasons.

By this method cheese can be blended so as to secure a uniform and characteristic flavor. The proper blending of the cheese is more important than any other factor. It does not take a cook with much experience to cook a batch of cheese that is properly blended; on the other hand, it is next to impossible to turn out a good batch of cheese that has been improperly blended. Pasteurizing always brings out the defects in the cheese.

The pasteurizing of the cheese is carried out within a few weeks of its final consumption.

There are different methods of making loaf cheese in the United States today. Essentially preparation consists of cleaning the cheese, removing bandages, paraffine, etc.; grinding the cheese, heating in a jacketed container with agitation, and filling into the proper containers. The process is watched and no cheese that does not come up to standard is allowed to go into loaf cheese. Men that have spent a lifetime in the cheese game watch the process all along the line.

When the cheese is heated there is at first a slight separation of butterfat, so that the ground particles appear oily. With more heat the cheese becomes plastic or stringy, and is said to "pull up". Upon a further agitation and heating this plastic condition is broken up and a homogeneous mass resembling the consistency of dough is the finished product in the hot state.

After each lot is inspected, it is emptied through funnels to the feeders in the packing department. The machine in use is a modified dough weighing machine. The dough-like prepared cheese enters this machine through the funnels and is fed into a revolving cylinder which measures out the cheese in five-pound quantities and discharges them through openings in the cylinder's side, two five-pound loaves being discharged at each half revolution of the cylinder. Each of these machines can weigh out 14,000 five-pound loaves per day.

The temperature of heating the cheese is very important and must be carefully watched. Some cheese can stand more heat than others. When finished the cheese should have strands about 15 inches in length—they should not be tough. There should be no free fat or free moisture. A noticeable gloss on the cheese is desirable.

Pasteurization of cheese has a wide application. American Cheddar, Swiss, Brick, Limburger, and Cammembert cheese have been successfully made. The soft cheese group has not yet yielded to this treatment.

Illinois. C. R. BARKER.

That which makes the glory of the nations is not the senseless clamor raised in public places, but the noble thought concealed in some garret, which, spreading one day over the whole world, will change its face.'—ANATOLE FRANCE.

Learn for your own advantage why Hudson and Essex outsell all rivals.

It is not merely because the Coach exclusively gives "Closed Car Comforts at Open Car Cost."

It is because both Hudson and Essex offer the most astounding value in genuine car PERFORMANCE and RELIABILITY.

It is because they have vibrationless motors—exclusive to them because they are built on the Super-Six principle.

More than 250,000 owners know their enduring value.

That is why they outsell all rivals—and why the Coach is the largest selling 6-cylinder closed car in the world.

An examination will convince you of quality not obtainable elsewhere within $400 to $1000 of these prices.

HUDSON Super-Six COACH $1500 *Freight and Tax Extra*

HUDSON MOTOR CAR COMPANY, Detroit, Michigan

EDITORIAL COMMENT

A WELL known, successful breeder of dairy cattle in Iowa made the following statement to a group of farmers at a creamery booster meeting: "Many times the right place to begin to improve dairying in different communities is to develop a new breed of dairymen." A Canadian Holstein breeder is credited with this statement, "We do a lot of talking about the 4,000-lb. cow but we should get after the 4,000-lb. man."

One rarely finds a poor man in company with a good herd of cows, and it cannot be successfully denied that the company of good cows has some beneficial effect on a man. It must always be remembered, however, that the man is the more important factor of the two in approaching that degree of success desired by most dairymen.

HOW ARE WE BUILDING?

Every farm, every farm barn and the arrangement of the lesser buildings about it, every farm house and its dooryard, every herd of cows, the team, the tools, and the fences, all reflect the character of the man behind them. What a lot of farmers advertise to the world that they belong to the ill-kept, unkempt, helter-skelter order of humanity! Everything about the farm tells that story. It has been said of many a man that "he buildeth better than he knew". If so, it was because he built in harmony with the central spirit and purpose of his life. If the man had no central spirit or purpose, save to hoard up a few dollars, then whatever he built was out of harmony and proportion, "thrown together" as we often see.

As farmers come to a larger measure of mind and understanding they will see that every farm is in reality a living center of "spirit and purpose". It has an object and the best expression of that object, the most harmonious and most efficient, is after all the real business of the farmer.

PASTURE IMPORTANT

"The weakest place in our knowledge of forage production," says C. V. Piper in the preface to his revised edition of Forage Crops, "is that relating to pasture and pasturage. Pastures furnish not only one-half of the total feed for animals, but they supply the only really cheap feed."

The dairy farmer has for years recognized the necessity of supplementing his bluegrass pastures with silage, soiling crops, or other feed. In many cases sad experience has created in him a disrespect for pasture. In his series of articles, Professor Fraser has given one way out through the use of sweet clover. But, whether it be sweet clover or something else, the dairy farmer is deeply concerned in the matter of pasture improvement.

Not only does pasture furnish the cheapest feed for the dairy cow and conserve the labor of the dairyman during the busy cropping season, but he is interested in pasture because science tells him that the green grasses contain a vitamin that aids the cow in the assimilation of lime. There is the further thought that the failure of cows to assimiliate sufficient lime is responsible for a portion of the sterility, irregular breeding, and abortion that are big factors in reducing farm profits.

We recently reviewed a copy of Willard's "Practical Dairy Husbandry" that was published back in 1872. Among the advertisements we find one of bone meal in which prominence is given the statement that bone meal is an "undoubted remedy for the dairy scourge—abortion in cattle".

Why do we cite this advertisement of a half century ago? If bone meal were a specific for abortion then, why has not its use become general and the losses exacted by abortion lessened? In the first place, it is extremely doubtful whether it is a "specific cure" for abortion. However, this does not mean that the assimilation of a proper amount of lime and phosphorus may not be helpful, but that it is not sufficient merely to feed these materials. Science has told us recently that they are not assimilated readily, but that when fed with green grass the cow can store up these minerals in her body. From this we get a new angle on the possible importance of supplying green feed for as long a period as possible to our dairy cows.

All of which reinforces the concluding statement of Mr. Piper, "The better management and improvement of pastures is perhaps the most crying need of American agriculture."

BEWARE OF MORTGAGES

A Vermont farmer some twenty years ago said to his son, "Beware of mortgages." This man had spent twenty or more years to lift a mortgage from his farm and he appreciated just what it meant to pay interest. As most farmers dislike mortgages they wait until they have money enough to pay for a thing which will not increase their incomes. They will run in debt for land, machinery, equipment, etc., that will help them in their work, but the most of them will not do this until they can make a substantial payment and can clearly see how they can pay off the mortgage. The following story was recently related to us:

Some years ago, a woman came out of a bank crying. Upon investigation it was learned that her husband had just borrowed $500 and placed a mortgage on their farm. Someone said to her, "I can't see why you should cry since your husband has been able to secure the money he requested from the bank." Her reply was significant: "We have just been able to make a living without this mortgage and how are we going to make one with the mortgage?"

If more people were concerned about running in debt and fully appreciated, as this woman did, its meaning, there would be fewer farm foreclosures. Debts incurred for increasing the income of the farm are not objectionable but, on the other hand, highly desirable. The wise farmer knows how he will use borrowed money before he places a mortgage on his farm and he will have well laid plans for paying the interest and meeting the mortgage when it comes due. Debts do not mean poverty but, rightly managed, mean prosperity and opportunity to increase the income of the farm.

SKIMMILK FOR BREAD

Wheat is the staff of life. It is one of our most common and important foods. A great majority of the people of the world use it in their daily diets, and it is looked upon as being essential to a well balanced meal. Recent investigations have brought new information concerning the building of healthful diets for people and it has been shown that the mineral matter of milk and its protein, as well as its fat, are highly essential to a good diet.

Much experimental work has been done to show the value of skimmilk in the making of bread. It is a common practice to use water, but with the advanced information concerning the proper diets it is found that wheat bread is very much improved by the use of skimmilk. The skimmilk provides mineral substances which are shown to be the most essential in building a healthful diet. Skimmilk also provides a complete protein.

In this country we have millions of pounds of skimmilk that are not returning the dairy farmer sufficient compensation. In the past few years much of this skimmilk is being turned into skimmilk powder and is being used in a few of the bakeries in the manufacture of bread, cake, etc. The quantity used in comparison with the opportunity of using skimmilk powder in bread is very small.

The housewife on the farm would find it advantageous to use skimmilk instead of water in making bread. The baker can afford to use skimmilk powder because it not only produces a more nutritious bread, but it actually increases the weight of the bread sufficiently to pay for the skimmilk powder. Even if it didn't do this, bread made of skimmilk powder would sell for enough more to yield a profit on the skimmilk used. It is important to the dairy industry and to the consumer that skimmilk instead of water be used in the manufacture of bread.

SHIPPING MILK

How far can milk be shipped and have it arrive at its destination in good, wholesome condition? This question has not been answered, but we believe that milk properly produced and handled can be shipped across the continent and still be in first class condition for drinking, or uses of various kinds.

At this year's Dairy Show was a unique exhibit of a truck carrying 1,350 gallons of pasteurized milk from Pittsburgh, Pa., to Milwaukee, Wis., a distance of nearly 600 miles. This truck left Pittsburgh at 10:05 p. m. Saturday, September 27, and arrived in Milwaukee 4:30 a. m. September 30. The milk, when put in the well-insulated tank, was cooled to a temperature of 36 degrees F. and when it arrived in Milwaukee it was 41 degrees F. After it stood in the warm sun for three or four days its temperature was 41½ degrees F. The milk was served to National Dairy Show visitors throughout the entire week, and we can attest that on Thursday, October 2nd, it was still as sweet and palatable as any one could desire. This unique demonstration shows what can be done when milk is properly produced, cooled to a low temperature, and held there until its consumption. Cleanliness, pasteurization, and cooling, when properly applied, will permit milk to be shipped almost any distance and arrive at its destination as perfect food.

UNIFORM QUALITY CHEESE

Elsewhere in this issue will be found an article by C. R. Barker of Illinois, discussing the importance of a uniform quality of cheese. In his communication he also describes how loaf cheese is made; how the process makes it possible to place on the market a more uniform quality product. We appreciate that since the advent of the loaf cheese the consumer has been given a better opportunity to purchase a uniform quality product and to purchase cheese in an attractive package and to keep a good supply on hand without danger of deterioration.

Loaf cheese has its place on the market. It does not, by any means, fulfill all the requirements of the consumers. No one kind or grade of cheese will meet the taste of every consumer. We quite agree with Mr. Barker that we need better quality of cheese and we also need more brands. Some consumers like old, firm, meaty cheese. Others like a soft, porous, weak body cheese and mild in flavor. There are various other grades of cheese, but these two types are sufficient to illustrate the point we desire to make.

It seems to us that if our well-cured cheese could be put up under a brand so the consumer who likes this kind of cheese could order it by brand, it would be the means of materially increasing the consumption of cheese. Likewise the fresh, porous cheese could be put up under a brand. Some people will not eat old cheese. To our way of thinking, they should like it for it is the best, so far as our taste is concerned, but if the consumer does not like it and prefers the newer cheese, it is only wise that this kind of cheese be put up under a brand so the consumer can purchase it.

It is disappointing to order a pound of cheese and then find it is not the kind that meets the taste of the family. The only way to approach meeting the tastes of all individuals is to have a number of brands and then exercise every precaution to have the quality of cheese run uniform under that brand.

When the cheese industry is fully organized there will be many brands of cheese placed on the market and then the consumer will have an opportunity to purchase the kind of cheese that meets his personal taste.

Smut in Cane Silage

I have orange cane with about one-sixth of heads smut. Is it safe to use same for silage? Some think cutter will knock smut out. I will thank you for opinion at earliest convenience as feed should be cut at once.

Cloud Chief, Okla. R. K. G.

The possible danger from smut is very slight. There is plenty of information showing plainly that smut in corn is entirely harmless when consumed by animals, and we are reasonably certain that the same thing applies to smut in cane. I find in talking to our experts in plant diseases that some of the smut that appears in sorghum cane is the same as that which appears in corn. If this is the case there would be no danger in feeding it. Further, they say that so far as is known there is no smut that is dangerous. I've personally experimented with corn smut and have fed a cow with five or six pounds a day for several weeks without any effects whatever.

Minnesota College of Agr. C. H. ECKLES.

Reseeding Sweet Clover

I tried a 5-acre piece of sweet clover for pasture this season. We succeeded beyond our hopes in regard to the amount of feed raised, but the most of it is still there and gone to seed, much of it about dry.

It was my intention to sow more seed in the sweet clover this spring, but it came on so slowly that I didn't know whether it was going to do well or not, so didn't bother. I found on examination that when the sweet clover was four inches above ground, it was over two feet below. It is nicely inoculated, used twice as much soil as seed and was drilled in and last year was the driest I ever saw.

The sweet clover is just one tangled mass. Could I cut it with a mower in a week or so, plow it shallow and seed it to rye and sweet clover and have sweet clover pasture there next spring?

Princeton, Minn. F. M. P.

I would not cut the sweet clover that has gone to seed and plow the land, as this would involve a good deal of work. As your correspondent wants this land in sweet clover pasture next year, the abundance of seed produced and trampled into the ground by the stock pasturing it should produce an excellent stand next spring without being touched.

I do not believe the extra pasture obtained from seeded rye would pay for the trouble. It would probably hinder the growth of the sweet clover and reduce the amount of pasture that could be received from this during dry weather in midsummer when the blue grass pasture, which is used in connection with this, would fail.

In the latitude of northern Illinois, it would be better if the cows could be kept off from this young sweet clover until about the first of June.

University of Illinois. W. J. FRASER.

Alfalfa in Georgia

HOARD'S DAIRYMAN:—Again and again we have been told that alfalfa belongs west of the Mississippi river; and still many more times have we been advised not to bother with it in the Southeast. It is adapted to a climate lacking the humidity that prevails in the eastern states. It is generally believed by those who have made a general survey of the situation that it is not suited to Georgia and other southern states.

In spite of all this, it seems from the information that seeps through to us that the acreage planted to alfalfa is increasing in such states as Wisconsin and Ohio in the Middle West; and certainly, farmers in this immediate section, that is in the northeastern part of Georgia, are sowing more alfalfa this fall than has ever been sown in any one year previous to this one.

Why is this? I have asked a number of farmers here about their alfalfa with the hope of answering this question. It seems that one of the reasons for the increased interest in alfalfa is the possibilities that exist in raising it as a cash crop. Hay is usually in good demand. It also usually sells well. Local dairymen have learned to appreciate the feeding value of alfalfa and at present it finds a ready sale at profitable prices. To illustrate, W. L. Childs, a farmer living near Athens, Ga., has four acres in alfalfa. This summer he baled the hay and sold enough from the four acres to give him $184 over and above the cost of harvesting and baling. He will obtain another cutting either late in September or early in October. Mr. Childs seeded these four acres in the fall of 1921 but failed to get good inoculation. He reseeded it in the fall of 1922 and got a fine stand. The production of 1923 was better than 1924, although the condition of the field is better at this writing, September 22, than last year this time. This was due to a very severe drought this past summer. From late in June until the second week in September no rain except occasional light showers were experienced. The alfalfa did not produce well but came through the dry and very hot summer in fine shape.

Mr. Childs states that the original cost in seed, lime, and acid phosphate was approximately $20 per acre. He has made preparation to sow a larger field this fall and states that he hopes to get fifty acres in this legume in the next few years, as he believes that it will give him a greater net profit than any of the other crops adapted to this section. He followed cowpea hay with the alfalfa, turning the peas under early in the summer in sufficient time to get the soil firm before sowing alfalfa. This fall he is going to try cutting of the pea vines or hay, harrowing the soil only and then sowing.

Mr. A. P. Winston, another farmer near Athens, has been an alfalfa enthusiast for years. He has sown alfalfa both in the early fall and in March with good results. He uses from three to four tons of lime per acre and from five hundred to six hundred pounds of acid phosphate. I asked him why he liked alfalfa and he unburdened himself after the following fashion: "The dry weather this summer almost ruined my corn, and did ruin my chances of making pea vine hay. Corn is quoted at $1.14. If we are compelled to ship in corn next spring and summer to feed our work stock, it is likely that we will have to pay over $1.50 a bushel for it. I have a lot of mules to feed. With the short corn crop and the almost no pea vine hay crop, alfalfa looks like my only chance of making a crop next year. I can get through the winter on corn stover and scraps for feed, but when work commences next spring the mules need sure enough feed. I figure that alfalfa and a half ration of corn will do as well as ordinary hay and a full ration of corn. Then, of course, the $400 I got the other day for some alfalfa hay I sold, helps my feelings a lot."

The reasons for increasing the acreage in alfalfa are illustrated by the cases cited above. Some desire a cash crop of high acre return, others want a feed of high value per acre.

The growing of alfalfa here is of recent development. The Georgia State College of Agriculture has been the prime mover in the development. On their test plots they seeded some alfalfa about 14 years ago. It looked so promising that Dr. Milton P. Jarnagin, who had charge of the general farming operations, seeded two acres the next fall. This was followed the next year with a seven-acre field. This seven-acre field is still in alfalfa from the orginal seeding. It has produced approximately 275 tons of hay. The college had 50 acres in alfalfa in all this year, of which seven acres were used for hog pasturage.

They recommended the sowing of alfalfa during the last week of September or the first of October. They also advocate the use of from two to three tons of lime and from four to six hundred pounds of acid phosphate at seeding time. The amount of lime to use is an open question, some of the alfalfa growers stating that one ton is sufficient while others use from five to six tons.

During the past season, the time of cutting of alfalfa has been given considerable attention and a few farmers are now waiting until the alfalfa is in full bloom, while in the past the cutting was commenced when the shoots at the base of the plants started to grow.

In January, 1915, Joe Wing was invited to the agricultural college to speak on alfalfa to the farmers attending farmers' week. His enthusiastical talk, which the writer was privileged to hear, gave a great impetus to alfalfa planting. At the time he made the suggestion to farmers that alfalfa be used both as a soil building crop and as a means of getting valuable hay. The former use of this legume is not being followed, as vetch is being sown on the lands worn out by constant cotton farming and seems to be better adapted to this purpose. Alfalfa is being grown on fertile soils and with heavy additional fertilization. At the time Mr. Wing made his talk here, he suggested that farmers use sweet clover for their poorest soils, but it has not been used to any extent. Although it has been nearly ten years since Mr. Wing's talk on alfalfa production, he is still constantly quoted as the leading authority on this subject.

Before leaving the subject, it might be well to mention that alfalfa has not proven successful in all parts of this state. In the Piedmont section where the heavy clayey soils are and in the limestone valleys of northwestern Georgia, alfalfa growing has become established, while in the coastal plains section there is practically no alfalfa grown.

Georgia. J. W. FIROR.

Home Suggestions to Breeders of Dairy Cows

HOARD'S DAIRYMAN:—Everybody knows that the black man belongs to the tropics and the white man to the temperate regions, and that either man suffers if he changes his natural habitat. Dr. Woodruff, late medical officer in the American army in the Philippines, published the results of numerous investigations to show that it was the evil influence of the sun which affected more particularly the blonde varieties of the white race and led to their extinction in three or four generations in warmer states of the South and the sunny states of the West as well as in Western Canada.

It was my privilege to meet Dr. Woodruff in Segon, Anam, about 1907. It was not known until 1887 that there was a universal law of relation between color and climate extending to all the animals in the tropics which are exposed to the full influence of the sun. I made the discovery in that year when investigating the different varieties of the hundred millions of cattle in India belonging to the zebu race of hump cattle. I found that although perhaps ninety per cent of them have white hair, their skins were invariably black or highly pigmented. It has since transpired that the advantage of pigmentation is its power to stop the penetration to the nerve centers of the ultra-violet rays or X-rays of the solar spectrum.

European cattle from which the various breeds of dairy cattle in America are descended are like the great majority of the European races, light in the skin under white hair. And they are therefore liable to suffer from sun-scald which results in blistering and an uneven, scurfy, unattractive appearance on the surface, also tenderness to the touch. There seems to be a tendency in America from a fancy point of view to incline to the white colored cattle. The Ayrshire, which normally is a brown cow, has been within the last fifty or sixty years transformed into a white animal with an occasional black patch and the same mistaken fancy extends to Canada and also to the mother country. In the latter case breeders have been induced to cultivate their white varieties to secure a footing in the market in America and Canada. The Swedes, who now possess the greatest number of Ayrshire cattle in any part of the world, came to Scotland about sixty years ago and picked up a great many of the best bred cattle at very moderate prices. They made no mistake about the color and not only the color but the true type of the Ayrshire breed is there represented in its tens of thousands today.

Some of the Holstein breeders appear to be inclined to follow the same mistaken course and breed white animals. They are doing so because some of the earliest of the heavy milkers were almost white. I have seen the male and female specimens which have been exhibited of the breed in plaster and they have only one objection, and that is that there is too much white near to the back line. The first and most important regulation to my mind for the defense of the breed in the climate of America is that it should have a black back extending down to the mid rib; white feet, legs, and a white underline are all right but a white back will in the course of time undermine the constitution of the cow and injure it as a milk producer.

Another important reason why the Holstein breeders' association should make no mistake in this very important matter of color is that if they go white they need not expect foreign buyers from South Africa, Australia, or even from Europe where already the question of color has received attention.

Jersey breeders have been wise in their generation, for the color of the Jersey as seen is much darker than that now prevailing in the islands of Jersey. The breed as a whole is a bigger animal showing development in constitutional vigor. In spite of its white color the Ayrshire breed is bigger than it is at home and if it were only back to its own normal hair coloring there is no reason why it should not still further improve, if breeders will keep in mind that to maintain the type they must now and then go back to the original home of the breed for a change of blood by the introduction of a superior bull.

Scotland. (DR.) ROBERT WALLACE.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

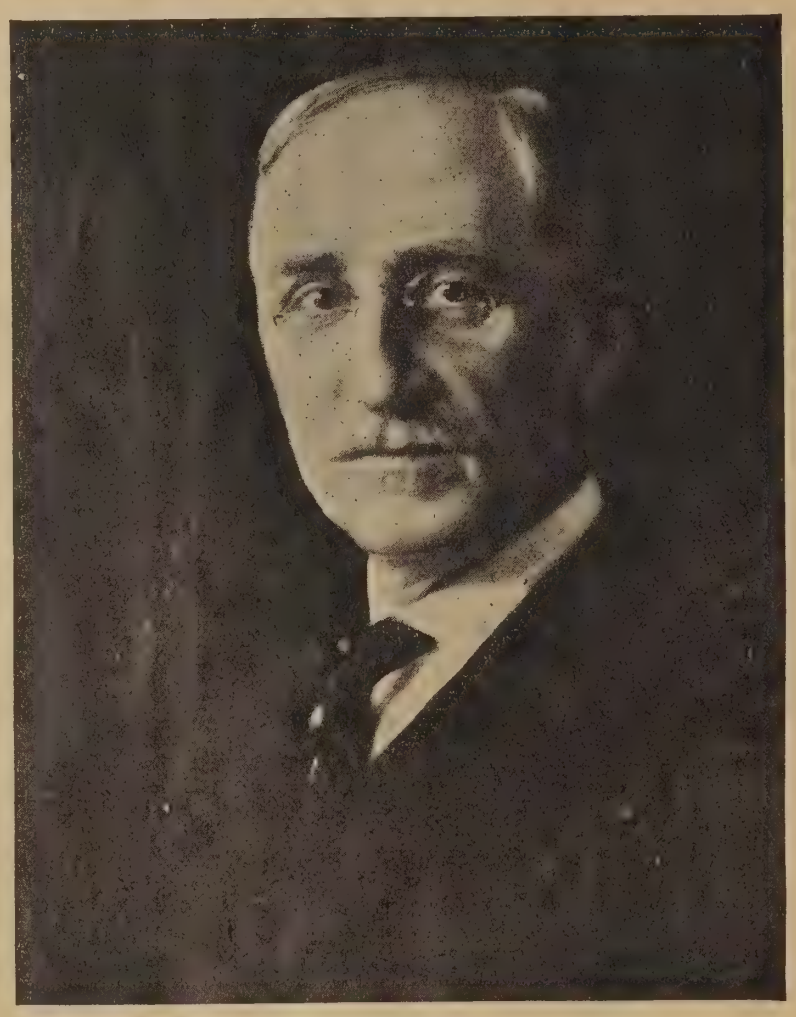
Dec. 10-12—Wisconsin Cheesemakers' Association meets in Milwaukee Auditorium. J. L. Sammis, Secretary.



Correction

Adell of Burnham Beach was placed second in the aged cow class at the Eastern States Exposition. In our report of this show she was mentioned as being in the three-year-old class. In view of the fact that she was not a blue ribbon winner we trust no inconvenience has been caused.

Honor Professor Farrington

HONOR was given one of Wisconsin's leading pioneer dairy investigators when friends and colleagues gathered at the unveiling of a handsome portrait of Edward Holyoke Farrington presented to the University of Wisconsin at a banquet gathering during National Dairy Exposition week in Milwaukee.

For the past thirty years, Professor Farrington has been head of the Department of Dairying at the Wisconsin College of Agriculture and has been responsible for several important contributions to the dairy industry. He is widely known throughout the dairy world as a scientist, investigator, author, scholar, executive, administrator, teacher, gentleman, and "man among men".

E. H. FARRINGTON

A. C. Baer, Oklahoma A. & M. College, presided at the banquet. In terms well deserved, tribute was paid by several speakers to the achievements and contributions of Professor Farrington—Dr. C. W. Larson, Chief of the Bureau of Dairying, A. C. Dahlberg of the New York Experiment Station, Tom Otto of the Harmony Creamery Company, and Mr. E. K. Slater of the Olson Publishing Company. That students of Professor Farrington are scattered all around the world was brought out in a most interesting letter read by Chairman Baer from Gustav Benkendorf, formerly associated with Professor Farrington at Madison, but now located with a dairy manufacturing company in California.

The formal presentation was made by Professor W. H. E. Reid of the University of Missouri. Professor Reid reviewed briefly the life of Professor Farrington. Born in 1860, Edward Holyoke Farrington spent his boyhood days in the state of Maine. At twenty-one he received his Bachelor of Science degree from the University of Maine, and later the degree of Master of Science. He also studied at the Sheffield Scientific School at Yale. Professor Farrington then became chemist at the Connecticut Agricultural Experiment Station. In 1889 he moved to Washington, D. C., and became the first editor of the Experiment Station Record. A call came from the University of Illinois for a chemist, and Professor Farrington answered. He served there for about five years and then went to Wisconsin as head of the Dairy Department. He served as chemist at the World's Fair Dairy Tests in Chicago in 1893 and in St. Louis in 1904.

When Professor Farrington first began his work at the University of Wisconsin, modern dairy manufacturing equipment was practically unknown. Through his investigations as a scientist, he contributed three widely known and used inventions, the Farrington alkaline tablets, the milk sediment test, and the test for moisture in butter. Only within the past year or two he has devised a test for accurately determining the per cent of butterfat in butter. He has written many bulletins, papers, and articles, and is co-author with the late F. W. Woll of "Testing Milk and Its Products".

"Through his personality, perseverance, common sense, and love for every student, the enrollment in the Dairy School has steadily increased year after year and placed the University of Wisconsin in the foremost ranks," said Professor Reid. "Some four thousand students have taken dairy work with Professor Farrington during the past thirty years. At the present time one out of every three managers of dairy manufacturing plants in the state of Wisconsin are students of Professor Farrington.

"The up-building of Wisconsin's dairy greatness has been the work of many men—none have made a more devoted and unselfish contribution than Edward Holyoke Farrington.

"In behalf of his former students, colleagues, and dairymen in this country and of all the world, I take great pleasure in presenting this portrait to the College of Agriculture at the University of Wisconsin."

Dean H. L. Russell accepted the portrait for the Hall of Fame now being established by the College of Agriculture.

"It is thirty years now since Professor Farrington joined the faculty of the University of Wisconsin," said Dean Russell. "He was thoroughly grounded in the principles of science—agricultural chemistry—and that is one of the foundation stones upon which his success has been built. There have been less changes in the administration of the various departments at the Wisconsin College of Agriculture than in most state colleges. I attribute the success which has come to the Dairy Department to the long period of leadership of Professor Farrington. I deem it a privilege and pleasure to accept this portrait in the name of the College of Agriculture."

Professor Farrington's portrait was painted by Arvid Nyholm of Chicago.

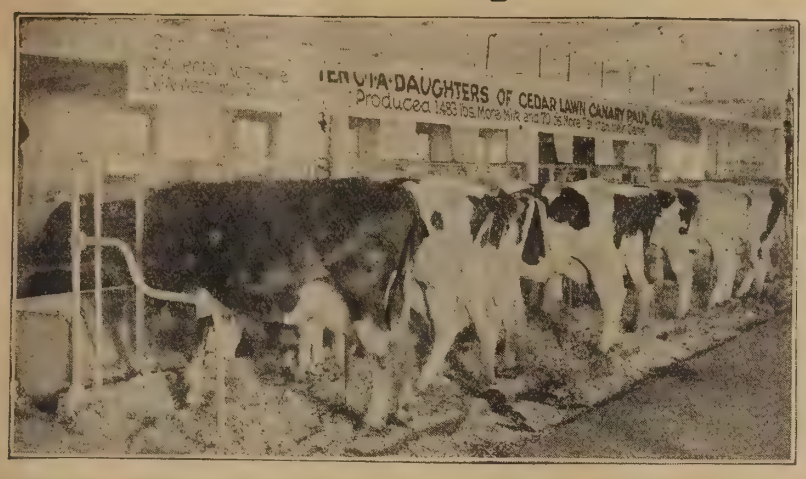
Wisconsin Dairymen to Meet

"Summer Feed for Dairy Cows" will be the main feature of a one-day session of the Wisconsin Dairymen's Association at Madison on Thursday, November 6. The principal speaker will be Professor W. J. Fraser, who will take as his topic "Ever Failing and Never Failing Pasture".

The evening session will be given over to a Dairy Conference of the various dairy and allied organizations of the state. It will be largely a round table discussion by each organization of the biggest problem now confronting it and how the other allied organizations can help in its solution. This discussion will be preceded by an address by E. R. McIntyre on "The Interdependence of the Various Branches of the Dairy Industry".

The morning and afternoon sessions will be held at the College of Agriculture in co-operation with the county agents and farm institute workers. The evening session will be held in the Hearing Room at the State Capitol. Further details may be secured by writing Secretary Paul C. Burchard, Fort Atkinson.

Tennessee Jersey Record



Since the beginning of this year three different Jersey cows have held the senior two-year-old Jersey championship and the record for this class for butterfat production is now almost 100 pounds higher than it was at the beginning of the year.

Noble Welcome's Flossie is the present title holder with a record of 597.71 pounds fat in 365 days. Test was commenced when Flossie was two years, seven years of age, and she carried calf for 193 days of the test. The new champion is owned by A. H. Mizell & Son.—American Jersey Cattle Club.

Fall Plowing Destroys Insects

Fall plowing of land infested with white grubs early in October before these pests go below the plow level will bring many of them to the surface where they can be devoured by chickens and birds or destroyed by freezing. It may be well to disk or harrow the newly plowed land to break up the soil and disturb the insects in it. If possible, chickens should have access to the field or garden as it is being worked.—Ohio Experiment Station.

Holstein Breeding Exhibit

CEDAR LAWN CANARY PAUL 6TH AND TEN OF HIS DAUGHTERS AS THEY APPEARED AT THE NATIONAL DAIRY SHOW

These daughters have shown their ability to produce 50 per cent more than their dams, which is high tribute to their sire as their dams had an average record of 342 pounds fat in a year.

CEDAR Lawn Canary Paul 6th objected to leaving his farm home in Washington County, Wisconsin, to visit the National Dairy Show. Although handled by his owners since his birth nine years ago, he refused their earnest solicitation to board the truck that was to carry him to Milwaukee. It took two experts from Milwaukee to induce him to take a free ride to the world's biggest and best dairy show.

"Sixth" not only fails to enjoy a kindly disposition, but he is not particularly prepossessing in appearance except to those who look first for dairy quality. Why, then, the effort to get him to the show? The reason is that his progeny have shown up well in the Allenton and Kohlsville Cow Testing Association that has finished its fifth year of testing with an average of 333 pounds fat per cow.

Ten daughters of this sire were shown by his side. In their immature form they produced seventy pounds more butterfat in a year than their dams did at mature age. If allowance for age be made, the heifers would be credited with an average yearly production of 14,313 lbs. milk containing 512 lbs. fat. The dams average 9,961 lbs. milk containing 342 lbs. fat. Canary Paul Sixth may well be credited with increasing the production of his daughters 50 per cent over that of their dams. This is more remarkable in that these dams were unusually good producing cows and would be a credit in any herd. In all breeding it is well recognized that the higher the record of the dam, the more difficult it is to increase the production of their daughters through breeding.

It is of large value to the Holstein breed that this old bull is still in service in the herds of the five farmers who now own and have been using him. It is to be hoped that he will be kept at work and give to his breed many daughters and sons of large dairy talent.

This exhibit was financed by the Holstein-Friesian Association of America and was made possible by the co-operation of the Wisconsin Dairymen's Association and the owners of the animals shown.

No matter how insistent the pressure of demand, Oakland always takes time to build each car right.

Rigid adherence to this manufacturing principle explains in large measure why the Oakland Six is winning and holding good will everywhere.

Standard equipment includes four-wheel brakes, disc steel wheels, balloon tires, Fisher Body, permanent top, Fisher one-piece V. V. windshield on closed types, Duco finish, centralized controls, unit instrument panel, automatic spark control. Glass enclosures for open cars at small added cost.

Roadster $1095; Touring $1095; Special Roadster $1195; Special Touring $1195; Landau Coupe $1295; Coupe for Four $1495; Sedan $1545; Landau Sedan $1645. Prices at Factory.

OAKLAND

PRODUCT OF GENERAL MOTORS

North Dakota Dairying

Last year North Dakota cows produced over forty-five million pounds of butterfat, according to the report of Dairy Commissioner Reynolds for the year ending June 30, 1924. Of this amount 23,724,520 lbs. were sold through cream stations for nearly ten million dollars. This is an increase of better than three and a half million pounds over the previous year. The price paid for fat raised from 36.3 cents a pound in 1923 to 40.3 cents for the year just closed. The increased price and increased production raised the returns to farmers by nearly two and a half million dollars.

In addition to fat sold to cream stations there were 11,626,240 pounds shipped direct by producers. The balance of the 45,181,879 pounds fat produced is accounted for in butter made on farms and in milk consumed.

"Looking back a few years," says Commissioner Reynolds, "one would find there were many who came to North Dakota with the purpose of raising grain, not milking. They claimed they had served their time as milkers, had been tied down in the eastern states, and came west where they could work a short time in spring and fall and make a year's pay. Many of these farmers have since seen their error and have changed into stock farmers, not only from the money received from selling cream and stock, but to rebuild and retain the fertility in the soil."

Again, in discussing the much discussed problem of overproduction, Mr. Reynolds says: "We do not need to worry as much about overproduction as we do about more economical production. This means better feeding and weeding out poor cows."

A system of cream grading has been established in which a price differential of four cents a pound fat has been agreed upon for first and second grade cream. The plan has not been in operation long enough to give definite results, but the Commissioner believes that improvement in quality has already appeared. Mr. Reynolds also discussed the evils of creameries offering premiums of various kinds to producers and is endeavoring to have them pay the highest cash price rather than give premiums of doubtful value.

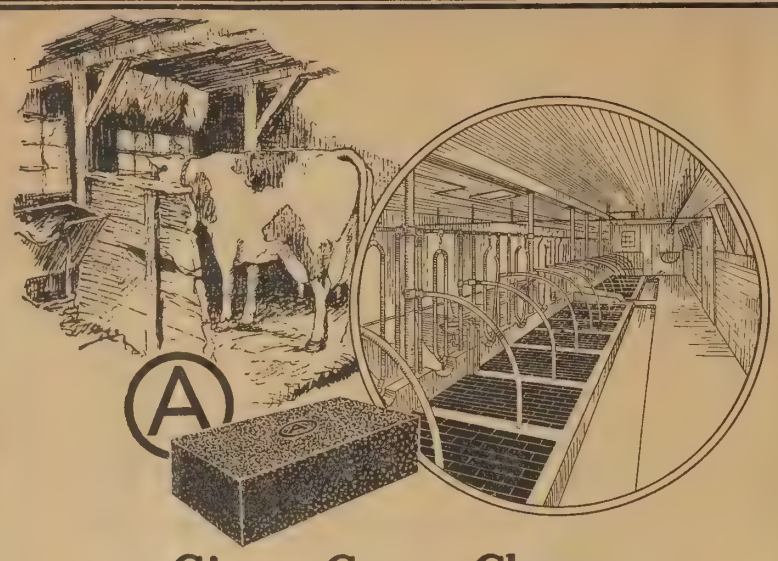
North Dakota is knocking at the door for admittance to the "Corn Belt", and the dairy cow is helping her upward. During the year just closed the acreage of alfalfa and sweet clover increased from 135,844 to 223,876 acres, while corn increased from 776,156 to 1,158,365 acres.

South Carolina Holstein

Princess Nell Ormsby is now the state's leading cow of the breed for production in one year as a senior four-year-old. Her record is 20,889.7 pounds milk and 678.25 pounds butterfat, equivalent to 847.8 pounds butter. She is owned by V. M. Montgomery.—Extension Service Holstein-Friesian Ass'n. of America.

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the 'Chilly King" Prevent losses from souring and returned shipments



Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

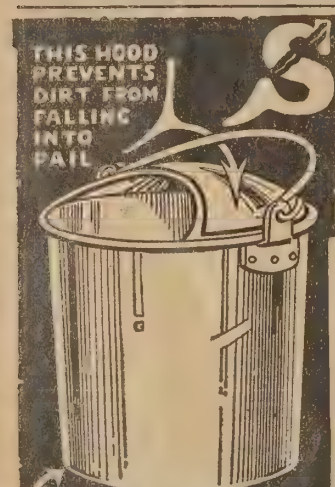
Give a Cow a Chance

ALL a cow asks is a fair chance to produce milk. That's her business and she'll attend to it well if you let her. But put her on a cold, wet, slippery floor and she'll use up so much energy fussing around to keep warm that she can't give the yield she should.

Floor every stall with

Circle A Cork Brick Floors



FOR DAIRY BARNS AND HOG HOUSES

It is warm. It is dry. It is nonabsorbent and sanitary. It is nonslippery. On such a floor she is comfortable and contented. She hasn't a thing on her mind—not a worry. She makes her food into milk, and gives it up generously.

Circle A Cork Brick are tough and durable and last for years. They are easy to lay and reasonable in cost—an economical floor that saves money and makes money for up-to-date dairymen.

Write for the book "Circle A Cork Brick" and a sample—sent free.

ARMSTRONG CORK & INSULATION COMPANY,
112 Twenty-fourth Street PITTSBURGH, PA.

Send No Money

FOR THIS DURO SEAMLESS SANITARY MILK PAIL.

Bottom and sides are one piece. Both interior and exterior surfaces are perfectly smooth, so there are no seams or crevices to harbor bacteria. The Duro Pail is made of heavy gauge steel heavily tinned, and will give a lifetime of service.

The Duro Seamless Hooded Milk Pail is strongly recommended by dairy authorities, for its use prevents dust and dirt from falling into the milk pail during milking.

Duro Pails are made in 14-qt. size only, and weigh 7 lbs. each. They may be supplied without hood when so ordered.

Send your name and address today and the Duro Sanitary Seamless Hooded Milk Pail will be shipped at once. When delivered pay the postman $2.25, (and a few cents extra for postage). Money refunded if at the end of 10 days you are not thoroughly satisfied with your purchase.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Wallace Replies to Charges Made by Marsh

On August 20th, Benjamin C. Marsh, Managing Director of the Farmers' National Council, wrote a letter to President Coolidge in which he stated that the termination of the appointment of John M. Burns, a law clerk in the Department of Agriculture, was "one of the most underhanded and sneaking cases of official terrorism in our country's history." He made reference to Burns' appearance before the House Committee on Expenditures last May in which he testified to the "gross maladministration of the Packers and Stockyards Act". Marsh charged further that Secretary Wallace appeared before the House Committee on Agriculture and "attempted to blacken the character of Mr. John M. Burns".

Secretary Wallace's reply to Marsh is given herewith in full:

SEPTEMBER 24, 1924.

BENJAMIN C. MARSH,
WASHINGTON, D. C.

SIR:—Your letter of August 24 to the President, in which you speak of the termination of the employment of John M. Burns, a law worker in this Department, has been referred to me with the request that I reply directly to you.

This letter is simply one more evidence of your malicious efforts to hamper and discredit the Department of Agriculture in its difficult task of eradicating the many improper practices which have existed at the various live stock markets and making sure that these markets are free, open, and competitive, and that farmers and stockmen receive the fair prices for their stock, just weight, and a square deal in every way.

You refer to the termination of Burns' appointment as a case of official terrorism. On the contrary, the Burns case was handled with far greater consideration than he had any right to expect, and he, himself, expressed appreciation of my consideration of him.

Burns' charges against the administrative officers of the Packers and Stock Yards Adminstration made before the Congressional Committee were thoroughly exploded and refuted not only by representatives of this Department but by such voluntary witnesses as John C. Brown of Indiana, formerly president of the Indiana Farm Bureau Federation, and later president of the largest live stock co-operative marketing association of producers; Charles C. Collins, of Colorado, long identified with western live stock associations, and others. The hearings of the committee had continued but a few days when it became evident that they had been instituted as a result of your misrepresentation and deceptions for purely political purposes, and that there was no foundation for the charges made against the officers of this Department.

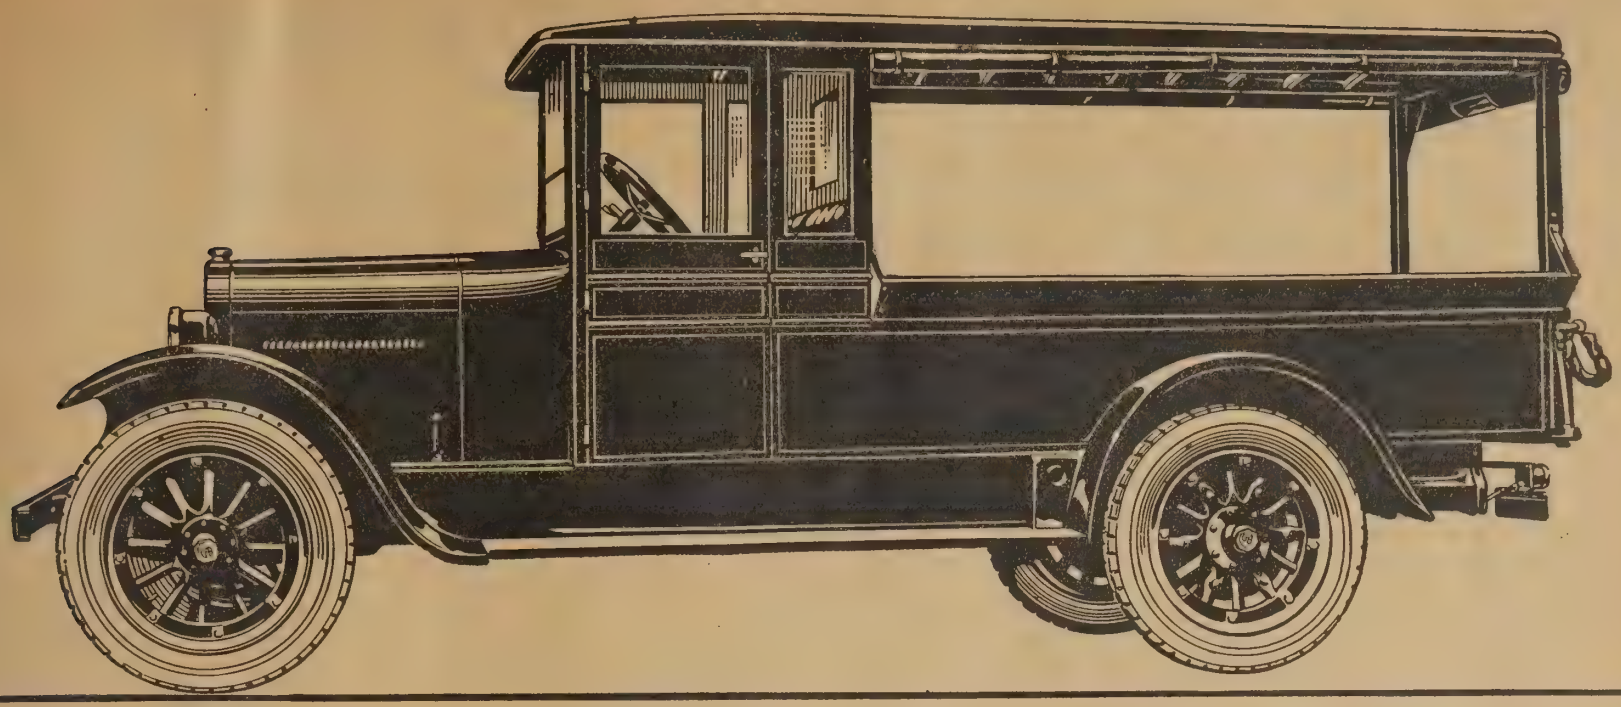
You say that I appeared before the House Committee on Agriculture and attempted to blacken the character of Burns. There is not a word of truth in this statement. When appearing before this committee on another matter, a member referred to the charges made by Burns. I said I hoped the Agricultural Committee would have time to look into that whole matter. Whereupon a member of the committee said something to the effect that Burns seemed to be having a brain storm, and I replied that that seemed to be all there was to it.

I have a good deal of sympathy for Burns, who really has some legal ability, but who seems unable to resist the malign influences of persons like yourself, and consequently becomes a victim of your evil machinations.

You refer to my employment of an outside lawyer in connection with the Armour-Morris merger case. I employed Walter L. Fisher of Chicago, formerly Secretary of the Interior, more than a year ago because of his outstanding ability and his long experience with the packers as attorney for the Marketing Committee of the American National Live Stock Association, which for years was active in securing a law for the control of the packers. Even you do not dare challenge the wisdom of this appointment.

Your letter carries the impression that you are authorized to speak for a considerable and responsible group of farmers. I know very well that you are not. You do not represent farm sentiment. You are not working in the interests of farmers, but on the contrary are, and for years have been, doing the cause of agriculture great harm.

I answer your letter only because it was sent to me to be answered. I know that neither you nor your letters are entitled to any attention or consideration whatsoever from anyone in a position of responsibility.



Very truly,
(Signed) HENRY C. WALLACE.

Co-operation

HOARD'S DAIRYMAN:—What is co-operation? There is magic in the word. Where does it get it? In no place is there truer co-operation than in the ideal home and no better example of many co-operating than in our government. These co-operate for the general good, hence the admiration of the idea in the American mind. But a house divided against itself cannot stand, neither can a government stand with trusts, blocks, organized labor, or co-operative societies, whichever you choose to call them, all antagonistic to each other, (crying "I am the true, you are the false") dominating it in turn. Rule or ruin is their true slogan just as rule or ruin is advocated by various secret societies or creeds at present.

It has come to pass that when a man says merely, "I am an American citizen", it pains the investigating committee. Wealth organized for its own greed first, others follow suit. Could those who held the nation's trust have been true, these non-patriotisms could never have been. What we cannot obtain through justice and our home government, will never be obtained by a good looking sect with a knife behind its back, nor by a league of nations all opposed to our welfare. Such a course means only bloodshed. Wake up and vote. Vote for a reason. Vote for the man or woman with a good known record. Vote for the home. Just as Christ is the true cornerstone of the church and was rejected, so is the home rejected now, the home which is the head of the corner of all free governments including our own U. S. A.

Michigan. R. W. STEED.

GRAHAM BROTHERS

Announce a New ONE TON Truck

Lighter, Sturdier, lower in price

1 TON CHASSIS $1175

1½ TON CHASSIS $1375

F. O. B. DETROIT

Like their 1½ ton truck—with which Graham Brothers advanced from twentieth to sixth position in the industry in three brief years—their new ONE-TON represents a distinct achievement in the commercial haulage field.

Impressive appearance, well built bodies, quick acceleration, volumes of reserve power, sturdy frame and axles, easy handling, comfortable riding, extremely low upkeep cost—and dependable service everywhere!

Its advantages are so numerous—and so pronounced—that even a casual examination will quickly satisfy you of its exceptional merit. Dodge Brothers Dealers will gladly show you the body best suited to your needs.

Transportation Expenses of a Cow Tester

RALPH RUSSELL, NEW YORK

WHAT do cow testers do with their money? Everyone expects them to be rolling in wealth. When I say I would like to own a presentable overcoat, a Ford younger than a nineteen-fourteen model or even a new radiator, a ticket to the movies, or what-not, the reaction of my auditor is always, "Well, you have plenty of money." An association tester is supplied with equipment and board and lodging by the members of the association, so that, except for his transportation, his wages are clear velvet. The tester is not often engaged in the occupation solely for the sake of the money there is in it, but it is peculiar that he is often without necessities through lack of money. Doubtless this is largely due to improvidence, but not wholly.

The innocent item of transportation should take some of the blame. Innocent appearing as it is, for travel of five miles a day, complicated somewhat by apparatus, books, and personal belongings, enough perhaps to fill a well-packed buggy or runabout truck, seems no great item. Be that as it may, at the end of fourteen months of testing I am unable to buy myself a needed pair of gloves and have a garage bill waiting for a portion of next month's wages.

A survey of my accounts for this period, singling out the items relating to transportation, reveals that the total cost for the fourteen months was $330.85, averaging $23.63 per month, the average salary for the period being $71.50. These costs should properly be divided into two periods: an era of horse drawn vehicles and a later period of motor transport. Before passing to a consideration by periods let me record that the transportation expenses for the year, October to October, were $285.71.

At the beginning of the association year in October, 1922, I purchased an old plug, an older Concord buggy, and a middle-aged harness which later developed leanings toward baling wire, that universal panacea. This outfit cost $65, a sleigh I later added to the fleet, $10. Three pair of shafts, purchased from time to time as the drifts became deeper and accidents more frequent, took me through the winter. As the farmer's friend, baling wire, as aforesaid, being more predominant in the make-up of the harness and another was procured second hand. The last of April, when the outfit was disposed of, all bills for shoes, calks, medicines, etc., had brought the total for transportation to $96.42.

The market for horses was very poor in the spring of 1923, so though I had fed Crowbait liberally at my patrons' cribs and easily doubled his value, I was compelled to sacrifice the entire outfit for $50. Thus I was out but $46.42 for seven months' cartage, averaging $6.63 a month, and the work of grooming, repairing outfit, and so on.

Moreover, though making always over twenty moves per month, and never waiting over on account of bad weather, but always carrying on until the month's round was done, Bait and I went through the most severe period of snow in the recent history of New York State, often breaking road, yet failing to get through but once. Though never carrying a snow shovel we missed a milking but twice, but the day the cutter tipped over in a blizzard was the only time we failed to get through. There were 21 successive days in January that year during which it never failed to snow at least a little during the 24 hours. And blow! From the great thaw, the first of January, until the 19th of March, there was no real thaw, and the thermometer was rarely above thirty-two. Except for the dread of the harness breaking and worry lest we might not be in time for milking, it was a very pleasant season, and Bait and I gained in health and weight.

My course of action with regard to buying a car was influenced by the fact that I had so far been unable to save any appreciable amount, and rather than go into debt to buy a good car I decided to buy with what little I had and face the heavy upkeep of a poor car. One of the members of the association had a 1914 Ford runabout truck, which I bought for $75. The night that I drew on the banks for this money, April 21, I had 50 cents left to me. The following week, I bought the truck body from the same man for $5.00.

The anticipated rapid disintegration and heavy upkeep did not disappoint me, and by the end of the year, that is, October 1, 1923, I had paid out on the auto $239.29, or approximately $47.86 per month for the five months it had been on the road, which, added to the expenses during the seven months preceding, $46.42, totalled $285.71, averaging for the 12 months $23.98.

The expenses of the next two months, October and November, amounted to $45.14, making the expenses for the seven months' auto use $284.43, $40.63 a month as compared with $6.63 for horse transportation. The total of the bills for gasoline and oil, of which I took particular account, was, for five months, $34.77, or $6.79 a month, and 14.5 per cent of the cost of keeping the machine. For seven months, these operating expenses, as I called them, were $46.42 or exactly the cost of horse transportation for the other seven months. This operating cost was 16.3 per cent of the auto expense, an indication, I thought, that study of the Rambling Wreck and personal service in repairing it had enabled me to reduce maintenance somewhat.

The complete total for transportation for 14 months was $330.85, averaging $23.63 a month. My total income for the year was $927.50; for the fourteen months, $1,067.50. According to these figures, 31 per cent of my income over the entire period went for transportation. For the seven months with Bait, the income was $540.40 with a transportation cost of $46.42. The seven months with the Rambling Wreck, my income was $526, and the transportation cost was $284.

My conclusions are not only that the cow tester's salary is not the clear velvet that it apears to be, but also that perhaps he would do well to stick to the humble horse, which cost in this instance one-sixth as much to maintain. On the other hand, considerable of this expense is doubtless due to social engagements which, with only a horse, the cow tester would be entirely cut off from. His time is so little his own that he would rarely get away from his work were it not for the automobile. With the horse the job soon becomes sheer drudgery; with the auto enough variety is introduced to make this occupation enjoyable though perhaps less profitable.

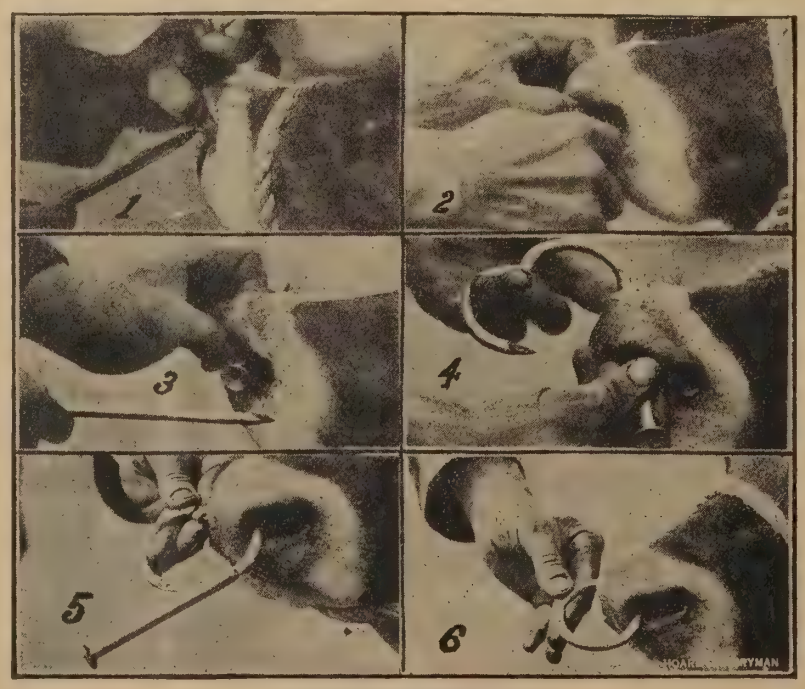
The argument for buying a new car rather than an old one never needed much bolstering, but here is a concrete foundation for it.

Ringing the Dairy Bull

J. O. TRETSVEN, MONTANA

ONE of the most important things connected with the management of the dairy sire, aside from the feeding, is in handling him so that he becomes tractable. To accomplish this, a ring inserted in his nose when 8 to 10 months old is most valuable to facilitate easy handling and making him submissive to his attendant. Failure to ring the bull at the proper time often leads to an unruly and dangerous animal. Not only is the life of the attendant endangered, but the value of the animal is greatly reduced. In many cases, the owners of vicious, though otherwise valuable, bulls are forced to sell them for bologna at the end of two years of service because buyers, or neighbors with whom they might exchange, do not want an unruly animal. Anyone who owns or handles a bull should be interested enough from a financial point of view, to say nothing of his own protection or the safety of the attendant, to provide it with a ring.

The best time to ring the bull is before he is a year old. At this time he is easily managed and soon learns to be handled by the ring. At first a 2-inch ring should be used. When this has been worn for about a year, it should be replaced by a 2½-inch ring. This size will serve well until the animal becomes very large, when a heavy 3-inch copper or gun metal ring should be used.



Ringing a bull is not a serious and difficult operation. By means of a sharp instrument, such as a pointed broken fork tine, a jackknife, or a trocar and canula (such as is used in tapping cattle for bloat), the membrane between the nostrils is easily punctured for inserting the ring.

The trocar and canula is about the most practical instrument to use, unless it is a punch made especially for the purpose, because the open canula makes it very easy for inserting the ring.

The accompanying series of pictures show the various steps taken in ringing a bull by the use of the trocar and canula.

In preparing the bull for ringing, it is well to have his head tied fast though often no trouble is experienced in ringing young bulls at the end of the halter.

After the bull is rung, he should not be handled by the ring until his nose is healed and at no time should he be handled so as to make him shy and fretful. While he is being taught to be handled by the ring, he should also learn to give his ring when the hand is stretched forward and the word "ring" is spoken. This is done by holding one hand out to receive the ring as the command is given. At the same time, with the other hand, by means of a rope attached to his ring, the nose is pulled to the outstretched hand. By repeating this several times the animal will soon learn to give his ring without any difficulty. As he grows older he should be handled gently but firmly and always with a strong staff.

HOW TO RING THE BULL

1. Ready to insert the trocar and canula. 2. Trocar and canula inserted in the division between the two nostrils. 3. Canula in nose after trocar has been removed. 4. Inserting end of the open ring into the canula. 5. Showing how the open ring is left in the nose as the canula is extracted. 6. The ring closed and the job completed.

Nobleness of the Dog

Remember always that, as Sir Walter Scott once said, "The Almighty who gave the dog to be the companion of our pleasures and our toils, hath invested him with a nature noble and incapable of deceit. He forgets neither friend nor foe, remembers with accuracy both benefit and injury. He hath a share of man's intelligence, but no share of man's falsehood. You may bribe an assassin to slay a man, or a witness to take away his life by a false accusation, but you cannot make a dog tear his benefactor."

"Sound housing should be the aspiration of a man for his family and of a nation for its people."—Selected.

The operators of Ford Trucks have long since accepted the Auxiliary Transmission as a helpful device.

This is borne out by the fact that there are more than a dozen different makes, each parading before truck owners and truck prospects its claim of superiority.

Where there is so wide a variety to choose from, it is necessary to exercise the same common sense that influenced you to purchase the Ford Truck. Buying sanity, which is nothing more than balancing the outlay with the advantages secured, will guide you to selecting the Warford.

Few, if any, of the Warford competitors offer you as much actual transmission. In providing the Ford Truck with *six* speeds, Warford gives you both a reduction in gear ratio for heavy going and an *increase* in gear ratio for high road speed on paved highways at normal engine speed.

Warford's mechanical advantage is made enduring by the use of the finest materials, chrome nickel and vanadium steels carefully wrought to close limits and assembled into a unit that is the equal of the transmissions of the most costly cars and trucks.

Hallowe'en Fun For Everybody

SOPHIA K. ORMOND

HALLOWE'EN falls on the last day of October, the following day being All Saints' Day. The celebration of this day dates back as far as the time of the Old Druids. During the entire year the Druids used to keep their fires burning on stone altars to honor the sun god. On the last night of October they dressed in white robes, put out the old fires, and built new ones. As the flames jumped up people tried to get some of the embers of the old fires and with them they started new fires in their own homes.

Later when Christianity put the Druid faith to flight, people soon came to believe that the fires burned up all the evil spirits and that only good fairies and witches and goblins danced in the woods.

So we can easily see how the early idea of a Hallowe'en of spirits and spooks has been handed down to us and why the notion to have a party or some kind of revel on Hallowe'en is still with us.

The essentials of a good Hallowe'en are a jolly group of young folks, an air of mystery about the place where the party is to be given, some good things to eat, and a good leader to start the thing off right and to keep it going.

It is always easy to get the young folks, for Hallowe'en parties are enjoyed by the very tiny folks as well as the older ones. It may be a party for the tiny girl and the dolls may be invited. Or, it may be a party for all the little folks who may dress up like cats, bats, and witches. A bride to be made it the occasion for an announcement party at which all the guests received little orange crepe paper bags containing little black cats. When the cats were let out of the bag the guests were surprised to find the names of the bride elect and the groom on the cat as well as the date they were to be married. Hallowe'en is also a splendid day on which to have a church party or a dance.

A cellar, an attic, or a barn would be as good as any place to have a party, as long as the place will hold the number of people necessary to accommodate and as long as the decorations make the place look "woodsy" and "spooky". Cornstalks, apples, pumpkins, and lanterns are the best decorations and they are easily obtained at this time of the year.

Some good things to eat are necessary. The bill is best filled with dark cake and cookies, apples, pumpkin pie, nuts, cider, or, if your crowd is older, with sandwiches and coffee.

A good leader to keep things moving is probably the most essential thing to make the party a success. Whoever is planning the party should select someone who is good some little time ahead so he can make plans as to just how he can keep the company entertained. If he is prepared with some of these old and new tricks he will be able to forestall any dull moments.

One of the oldest tricks is giving the guests an apple to pare. Each guest must keep the paring whole and when the apple is pared he must throw the paring over his left shoulder. As the paring drops to the ground the guest should be able to see in it the initial of his or her future life partner.

The "Three luggies" is another fortune telling stunt that is hardly ever omitted. Three bowls, one filled with water, one with milk, and one empty, are placed on the table. The guests blindfolded put their left forefinger into a bowl. The bowl containing milk signifies a desirable marriage, the bowl of water signifies marriage to a widow or widower, and the empty bowl signifies single blessedness.

Fortunes may be told on little cards put into envelopes and tied with different colored ribbons. The fortunes should read as follows:

Choose the bow of violet hue
You'll have a lover fond and true.

The bow of pink will bring you luck
A lover young and full of pluck.

Gladly take the bow of green
'Twill bring you gold and gems, I ween.

You'll soon move to another town
If you choose this bow of brown.

He who takes the bow of red
Will live alone and never wed.

Do not choose this bow of blue
Else you'll wed, not one, but two.

If you draw this bow of white
You'll see your own true love tonight.

Here is a spell-down that young or old would enjoy. It is guessing the nicknames of the states. A prize may be awarded to the person who guesses the largest number or who is at the head of the class at the end.

Alabama—Land of Flowers.
Arkansas—Bear State.
California—Golden State.
Colorado—Centennial.
Connecticut—Nutmeg.
Delaware—Blue Hen.
Florida—Peninsula State.
Georgia—Cracker State.
Illinois—Prairie State.
Indiana—Hoosier State.
Iowa—Hawkeye State.
Kansas—Jawhacker State.
Kentucky—Blue Grass.
Maine—Pine Tree State.
Maryland—Old Lind State.
Massachusetts—Bay State.
Michigan—Wolverine State.
Mississippi—Bayou State.
Minnesota—Gopher State.
Missouri—Bullion Stew.
Montana—Singed Cat.
Nevada—Silver State.
New Hampshire—Granite State.
New Jersey—Garden State.
New York—Empire State.

A substitute for a card party is the pumpkin seed party. For it the tables are arranged the same as for a card party. In the center of the tables a pumpkin is placed half filled with a mixture of pumpkin seeds and navy beans. At the time the leader specifies the players help themselves to a spoonful of the beans and seeds. They are removed from the pumpkin with a small spoon and placed on plates in front of the players. The players must pick them apart and the couple who has the most seeds when the leader calls the halt, progresses to the next table.

At the second table the game may be varied by having the players drive the seeds into apples or trying to get more seeds to their pile by carrying them from a dish on a pencil to their own plates. There should be simple little prizes for the ones who have succeeded best with their seeds.

Hallowe'en Cake

If you are not planning to go to much trouble for Hallowe'en this year, you can still give your family a little treat with a Hallowe'en cake.

Just make any recipe you like and bake it in a rectangular pan. Put on a yellow icing if you have the coloring; otherwise white is all right. When this has set, melt some chocolate over hot water, take a toothpick and, dipping it in the chocolate, either draw one large figure like a cat, witch, or jack-o'-lantern on the top or else score the top of the cake dividing it into pieces as you intend to cut it and then draw a figure on each piece.

The one big figure is less trouble and almost as much of a joy to the children, as they have a world of fun comparing their pieces to see what each one got in the way of the witch's cap, broomstick, and legs.

If you are very energetic you can cut the cake into pieces and put icing all around sides and top and then paint the pictures on the top and put a chocolate half moon on each side.

In case you are not satisfied with the recipe you have for plain white cake, here is one that has been my standby for years. It never fails if it is made with any care at all. It's only drawback is that in order to get the finest results you are obliged to use cake flour.

White Cake

½ cup shortening
1½ cups sugar
1 cup water or milk
1 teaspoon vanilla
3 cups flour
5 level teaspoons baking powder
Whites of three eggs.

Cream the shortening, add sugar, and cream again. Add the flour and water alternately, the baking powder being mixed into the flour in advance. Add vanilla and fold in the whites of the eggs beaten stiff.—LUCY THOMPSON.

Baby's Dusting Powder

If you have a little baby it goes without saying that you have a can of some kind of powder to dust him off with after his bath. It also goes without saying that he loves to get hold of this and shake it around and bite it. No matter how carefully you may close the top and no matter how small he is, there is always the chance that he may be able to get it open. So be sure you watch him for now and then a baby is smothered by getting his nose and mouth full of this dusting powder.—Lucy Thompson.

"Your husband has been ill?" asked the clergyman, who was paying his monthly call.

"Yes," replied the worried-looking woman. "He has been feeling very badly. I do my best to please him, but nothing seems to satisfy him."

"Is his condition critical?"

"It's worse than critical," she answered with a sigh, "it's abusive."

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

No. 2197—New Fall Style. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measuer. Size 36 takes 3⅝ yards 40-inch material.

No. 2203—Slenderizing Lines. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 takes 4 yards 44-inch material.

No. 1641—Becoming Style for Mature Figures. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 takes 3¾ yards 44-inch material with ⅜ yard 36-inch contrasting.

No. 2207—Attractive Apron. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 1¾ yards 36-inch material.

No. 2034—Slip to be made with built-up shoulder and V-neck or with straight upper edge and shoulder straps. Cut in sizes 16 years, 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 takes 2⅝ yards 36-inch material.

No. 2190—Dress for the Tiny Miss. Cut in sizes 2, 4, and 6 years. Size 4 takes 2¼ yards 36-inch material with ⅜ yard 32-inch contrasting.

No. 1935—Smart Afternoon Dress. Cut in sizes 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3½ yards 40-inch material with 1¼ yards 36-inch contrasting.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

When silver has become scratched, rub it with a piece of chamois dipped in oil.

50,000 Miles in a KNIGHT

One year—two years—three years—four years . . . adding up the miles like an adding machine . . . laughing time and distance down the wind . . . still young in looks and young in action . . . and you, the owner, living over and over again the first thrills of possession!

This big, luxurious Willys-Knight Sedan further endears itself the farther you drive. It carries its secret of long life under the hood—a whispering engine that literally *improves with use*—a fountain of power scotfree from all need of valve-grinding or carbon cleaning!

Time has never yet measured the full life of a Willys-Knight sleeve-valve engine. In ten years, now, no Willys-Knight engine has ever been known to wear out. Owners report 50,000 miles and more without spending a cent for repairs on the engine!

Fifty thousand miles of unshadowed pride and pleasure—and more to follow! Miles of lazy comfort—deep velour cushions to rest you—weathertight windows to protect you from storm and cold—and the easiest of all cars to handle. It steers as easily as you turn your head!

Remington Game Loads

Remington

Heavy Duck Load
Long Range Load

12-gauge suitable for Duck, Brant, and Jack Rabbit. No. 4, 5 or 6 Chilled or Soft Shot.

16-gauge suitable for Duck, Pheasant, Rabbit, Partridge, Grouse and Prairie Chicken. No. 4, 5 or 6 Chilled or Soft Shot.

20-gauge — 2¾ in. shells — suitable for Duck, Pheasant, Rabbit, Partridge, Prairie Chicken and Grouse. No. 6, 7 or 7½ Chilled or Soft Shot.

Remington

Specific Loads for Specific Game

Remington Game Loads are scientifically loaded to a uniform standard of velocity, pattern and penetration, all with moderate recoil. They are loaded exclusively with the finest American-made smokeless powders in Nitro Club *Wetproof* Shells. *Wetproof* means just what it says.

Duck Load

Suitable for Duck, Pheasant, Hawk, Crow, Rabbit, Partridge, Prairie Chicken and Grouse. 12, 16 and 20-gauge; No. 5, 6 or 7 Chilled or Soft Shot

Grouse Load

Suitable for Grouse, Prairie Chicken, Pheasant, Partridge, Dove, Rabbit, Duck and Squirrel. 12, 16 and 20-gauge: No. 7 Chilled or Soft Shot.

Buck Shot Load
Long Range Load

Suitable for Deer, Black Bear, and Wolf. 12-gauge; loaded with 12 pellets of No. 0 Eastern Shot.

Quail Load

Suitable for Quail, Dove, Woodcock, Rail, Plover and Snipe. 12, 16 and 20-gauge; No. 8 Chilled or Soft Shot.

Rabbit Load

Suitable for Rabbit and Squirrel. 12, 16 and 20-gauge; No. 6 Chilled or Soft Shot.

The Highest Quality Shotgun Shells Ever Produced

REMINGTON Game Loads are just two years old. Yet there are thousands and thousands of sportsmen the country over who will shoot no other shell. There are more and more Game Loads being bought and shot each day—the strongest possible endorsement of their superior shooting quality.

Specific Loads for Specific Game plus *Quality*—there you have the whole story of the success of Remington Game Loads.

The *right* load for duck, the *right* load for squirrel, the *right* load for quail and so on down the list.

And by "right load" we mean not only the right size and amount of shot, but the right *velocity*, the right *pattern*, the right *penetration* for the particular game. Every Remington Game Load is scientifically loaded to a *uniform standard* of velocity, pattern and penetration, all with moderate recoil.

Remington made it possible for sportsmen to buy *shotgun shells* with the same confidence they have been buying Remington rifle and pistol cartridges for over sixty years. Leaving it up to Remington to settle every detail—*including the kind or powder and the weight of powder.*

* * *

The Remington Game Load idea is the biggest forward step in shotgun ammunition since Remington produced the first successful loaded shell back in the 80's.

But the idea *alone* would not have swept from coast to coast as it has without the backing of *first and finest quality* behind it.

Remington Game loads are loaded in *Nitro Club Shells.*

They are loaded with the finest American-made smokeless powders. The finest brass bases, the finest battery cups, primers, shell bodies, wadding and shot that 108 years' experience in firearms and ammunition can produce.

They are made *Wetproof* by the patented and exclusive Remington Process. They are inspected and tested as are no other shells in the world.

* * *

Get a box of Remington Game Loads. Shoot out the facts for yourself.

REMINGTON ARMS COMPANY, Inc.
Established 1816
25 Broadway New York City

Remington

FIREARMS—AMMUNITION—CUTLERY—CASH REGISTERS

Squirrel Load

Suitable for Squirrel and Rabbit. 12, 16 and 20-gauge; No. 6 Chilled or Soft Shot.

Snipe Load

Suitable for Snipe, Rail, Plover, Woodcock, and Quail. 12, 16 and 20-gauge; No. 9 Chilled or Soft Shot.

Goose Load
Long Range Load

Suitable for Goose, Fox, Turkey and Raccoon. 12-gauge; No. 2 Chilled or Soft Shot.

Dove Load

Suitable for Dove, Quail, Rabbit, Partridge, Plover, Grouse and Woodcock. 12, 16 and 20-gauge; No. 7½ Chilled or Soft Shot.

Trap Load

12-gauge only; regulation charge of 3 drams finest smokeless powder and 1¼ ounces of No. 7½ Chilled Shot. Special wadding.

"ECONOMY" Specified Loads

TRADE MARK

Made by Remington

There are three master loads—"Economy" Light Load, "Economy" Medium Load and "Economy" Heavy Load. Each master load comes in 12, 16 and 20-gauge with chilled or soft shot of various sizes. See the table below.

Heavy Load

Remington has also developed an "Economy" Target (Trapshooting) Load for the man who wants a low priced load for practice use at the traps. 12-gauge only—loaded with 3 drams No. 2 Smokeless Powder and 1¼ oz. No. 7½ Chilled Shot.

Medium Load

"ECONOMY" Loads	Weight of Powder	Weight of Shot
12-gauge Light	3 drms.	1 ozs.
12-gauge Medium	3 "	1⅛ "
12-gauge Heavy	3¼ "	1⅛ "
16-gauge Light	2½ drms.	⅞ ozs.
16-gauge Medium	2¾ "	⅞ "
16-gauge Heavy	2¾ "	1 "
20-gauge Light	2¼ drms.	¾ ozs.
20-gauge Medium	2¼ "	⅞ "

Shot sizes supplied in all the above:
Chilled Shot—sizes 4, 5, 6, 7½ only
Soft (Drop) Shot—sizes 4, 5, 6, 7, 8 only

Light Load

A new Smokeless Shell at a lower price

THERE are many men who want a *moderately priced* smokeless shell for ordinary shooting.

Up to now they have had to buy either black powder shells, shells loaded with a mixture of black and smokeless powders, or unknown brands of "smokeless" shells of doubtful origin and shooting quality.

Remington has an obligation to these sportsmen—no less than to the men who want the very finest shells—Remington Game Loads.

So Remington has produced the "Economy" Loads.

They are loaded with genuine smokeless powder—the No. 2 Smokeless made by DuPont, Hercules and Dead Shot.

They are made *Wetproof.*

They are carefully made and carefully inspected. That is the Remington way of doing things.'

They are good, honest shells—the very best that can be produced *at the price.*

A strip of rubber cut from a "U.S." Boot will stretch more than five times its length —without breaking

THIS TEST SHOWS

one big reason why "U.S." gives longer wear

FIVE TIMES its length! It takes real rubber to stretch like that.

But that's what a strip of rubber cut from a "U.S." boot will do.

No higher quality rubber has ever been put into a boot—and that's one of the big reasons why "U.S." boots wear longer.

It explains why they stand the constant bending and wrinkling that makes ordinary rubber crack and break—why they stay pliable and *waterproof.*

Then, too, there's layer on layer of tough fabric reinforcements built into every "U.S." boot. *Where the hardest strains come, there are as many as eleven separate layers of rubber and fabric.*

Farmers everywhere have discovered that "U.S." boots are a big economy—that they wear longer and give better service. It will pay you to ask for "U.S." and get the longest wear your money can buy.

"U.S." Walrus—

THOUSANDS of farmers have found that nothing else gives them the convenience of the "U.S." Walrus—the famous all-rubber overshoe.

Worn right over the shoe—it is slipped on or off in a second.

No need to track mud and mire into the house.

The Walrus is made with the same elastic rubber and strong reinforcements that go into the boot.

Other "U.S." Rubber Footwear

You'll find every type of rubber footwear in the big "U.S." line. There's the "U.S." lace Bootee, a rubber workshoe for fall and spring—and "U.S." Arctics and Rubbers for every member of the family. Look for the "U.S." trade mark whenever you buy.

Association Notes by Testers

Elkhart Co., Ind.: Of the 272 cows tested last month, six cows produced 60 lbs. fat, 13 over 50 lbs., 31 over 40 lbs., and 93 over one pound daily. Two herds were tuberculin tested. One stable was whitewashed. Twenty-four members fed grain. Market milk sold for $2.00—3.12 per cwt. The condensery paid $2.00 per cwt. for milk and the creamery 32—40c per lb. for fat. Milk retailed for 10—12c per quart in September.—W. D. Campbell.

Mesa Co., Colo.: One member sold all his grade cows. Three herds averaged over 40 lbs. fat per cow. Market milk sold for $2.33—2.90 per cwt. and retailed for 10—12½c per quart last month.—C. H. Boyd.

Northern & Central Berkshire, Mass.: Butterfat contests have aroused much interest in the local fairs, cows in testing associations being the winners every time. One new member joined the association with a registered Guernsey herd. Market milk sold for $2.71 per cwt. and retailed for 14c per quart in August.—T. H. Weed.

Wellsville—College Ward, Utah: One new member joined this association. Sixty-eight per cent of the members feed hay and 10% grain. The condensery paid 44c per lb. for fat in September.—R. Hansen.

McLean Co. D. I., Ill.: Two members installed drinking cups in their barns. Another good sire was saved from the block through the efforts of the tester, as he was sold to another member. His dam has an association record of 506 lbs. fat.—H. R. Fletcher.

South Dakota Co., Minn.: Two more herds were tuberculin tested. One herd of 21 head came through clean and eight reactors were found in the other herd.—F. R. Lee.

Tri-County, Ohio: One milking machine was installed. Two new silos were built. One member installed individual drinking cups. The third cutting of alfalfa is being made. Several silos have been filled. Oats are all threshed and made a very good crop in this section. Market milk sold for $2.65 per cwt., 20% cream for $1 per gal. Milk retailed for 15c per quart, butter 63c per lb. in September.—E. A. Mizer.

Henrico, Va.: One member installed drinking cups, another put in an electric lighting plant. One herd had its regular tuberculin test, resulting in two reactors. One accredited herd of 85 Holsteins was sold at auction. Beginning October 1st the Virginia Dairy Co. of Richmond will take only milk from tuberculin tested herds. Market milk, Grade A, sold for $4.71 per cwt.; Grade B, $4.05 per cwt., and retailed for 18c per quart last month. All members of the association sell only fluid milk.—S. Simpson.

Southside, Va.: Three new silos were erected. Soy beans are being ensiled with the corn to a large extent. The high herd averaged 966.3 lbs. milk, 30.97 lbs. fat, making a profit of $20.90 above cost of feed. The lowest herd averaged 264 lbs. milk, 11.4 lbs. fat, profit, $7.20 above feed cost. If the owner of the lowest herd had sold milk to the creamery, he would have lost money. It is the high price of milk in this section that allows profit on such low production. Market milk sold for $3.93 per cwt. and retailed for 15c per quart. The cheese factory paid 42c per lb. for fat. Sweet cream brought 39c a lb. fat, sour cream 36c in September.—C. A. Buck.

Fairfax Co. No. 1, Va.: Ninety cows made over 40 lbs. fat, 20 over 50 lbs. last month. Silage crop is 70% less than normal. Corn will barely make a half crop. Feed prices are soaring, while milk prices remain stationary. Last month market milk sold for $3.02 per cwt., 20% cream for $1.30—1.45 per gal. Milk retailed for 14c per quart, butter 50c a lb.—C. E. Snell.

Summit Co. No. 1, Ohio: Allenhurst Farm recently purchased a herd from Texas, which includes the champion fat producer in her class in the state of Texas, also a herd sire who was a grandson of May Echo Sylvia. Market milk sold for $2.88 per cwt. and retailed for 12c per qt. last month.—L. E. Hubbard.

Hancock Co. No. 1, Ia.: One separator was found to be operating at a loss. Several members have started feeding grain rations. One new member joined the association. The creamery paid 38—43c per lb. for fat last month.—H. W. Tiggeman.

Colesburg—Two Co., Ia.: The fat average for all cows tested last month is 27.3 lbs., which is .8 lb. higher than our highest herd average a year ago. Last month the creamery paid 40c per lb. for fat.—G. H. Crawford.

Ada Co., Ida.: Two separators were found to be doing inefficient work. One member replaced his scrub bull with a pure-bred. The creamery paid 39—41c per lb. for fat last month. Milk retailed for 10—12c per quart, butter for 39—50c per lb.—T. E. Maberly.

Baltimore Co., Md.: Two stables were concreted. Two new silos are being built. Two new barns have been blue printed and work is expected to begin soon. Silos are still being filled. The corn crop is short, immature, and storm-damaged. Market milk sold for $3.02 per cwt. last month.—R. K. Mills.

East Montcalm, Mich.: Two summer silos were put up last month. One other member is putting up a silo. Two separators were tested. Filling silos is the order of the day. All members but two have silos. Last month market milk sold for $2.00 per cwt. The condensery paid $1.75 and the cheese factory $1.65 for 4% milk.—K. L. Orr.

Barry No. 1, Mich.: Nearly all cows are dry, owing to the fact that most of them freshen in the next two months. There are 19 wood and 6 tile silos in this association. The condensery paid $1.55 per cwt. for milk, the creamery 37—41c per lb. for fat in September.—W. W. Preston.

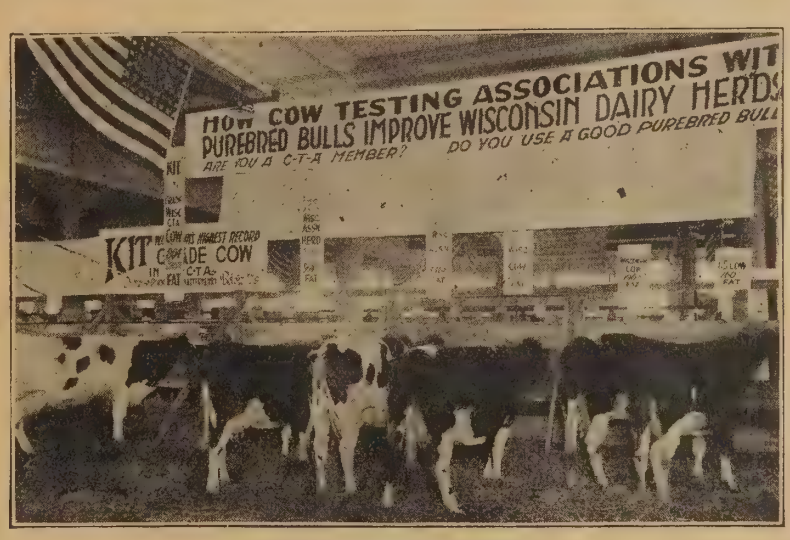
Alpena—Leer, Mich.: The 239 cows tested averaged 550 lbs. milk, 24 lbs. fat. Eighteen cows made over 40 lbs. fat. In September market milk sold for $2.25—3.00 per cwt. and retailed for 15c per quart.—O. Jennings.

St. Clair Co. No. 3, Mich.: A bull association of five members organized in July, bought and placed a pure-bred Holstein bull having a record of 846 lbs. fat to his dam's credit. Market milk sold for $3.00 per cwt. and retailed for 12c per quart in September.—H. J. Larsen.

Farmington, Wis.: The high herd of 16 Holsteins owned by Max Kirmse averaged 34 lbs. fat last month. The condensery, cheese factory, and creamery each paid 48—50c per lb. fat.—J. G. Strathearn.

McComb No. 2, Mich.: One herd was tuberculin tested and no reactors found. At the local county fair six breeders of dairy cattle exhibited stock. Five of these men are members of cow testing associations.—C. Blumer.

Alpine—West Bend, Mich.: One member installed a new Jamesway system. All show herds from here did well at the fairs. Several members attended the National Dairy Show and report a good show and a good time. All members are busy filling silos. Last month 3.5% market milk sold for $2.60 per cwt. The condensery paid $1.80 for 4% milk.—P. C. Wittenbach.



Reedsburg—LaValle, Wis.: Five herds were tested for tuberculosis. Two silos were erected on farms having one silo. One member started semi-official testing. The creamery paid 42c per lb. for fat last month. Milk retailed for 9c per quart.—D. F. Riley.

Southern Dodge Co., Minn.: During September 328 cows were tested that averaged 19.44 lbs. fat. Bloom Bros. & Bennett received credit for high herd. Their herd of 23 Guernseys, 20 milking, made an average of 28.07 lbs. fat. These cows received silage in September but not in August. In August they made an average of 25.13 lbs. fat. Three new separators and three silos have been purchased since the association started in July. A number of stave silos were blown down by the high wind a few weeks ago.—N. G. Kepner.

Six cow testing associations in Pierce County, Wisconsin, had 172 members during the year just closed. It is interesting to note that 156 pure-bred sires, and 105 farms are either accredited or under federal supervision, 167 herds are headed by pure-bred sires and 105 farms are growing alfalfa. The average production per cow for the six associations for the year was 254.4 pounds butterfat. There were 191 cows that produced over 365 pounds of butterfat for the year.

"No oleomargarine used by members" is found at the head of the list which summarizes the year's work of the Ellsworth cow testing association, Pierce County, Wisconsin.

Cow Test Exhibits at National

STEPS IN DAIRY PROGRESS

This exhibit was shown at the Cow Test Barn at the 1924 National Dairy Exposition. Cows having production of 160 to 804 lbs. fat were shown to illustrate the average production of all cows in the U. S., of all cows in Wisconsin, of all cow test cows in Wisconsin, of the best cow testing association, of the best herd, and the best grade cow in C. T. A. work in Wisconsin.

HALF SISTERS OF DAIRY TALENT

Nine daughters of one sire shown at the Cow Testing Association Exhibit Barn at the National Dairy Exposition. These cows are from the Rockwell & Katterhenry herd of the Beloit, Wis., C. T. A. They average 496.6 lbs. fat in a year.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were steadier following sharp declines of previous week. Trading still rather quiet as sellers asked rather high margins, although buyers were waiting for further declines. As week progressed the attitude of both changed somewhat and some business resulted.

The average wholesale prices on American cheese, style Twins, for the week ending Oct. 11, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Oct. 11 1924	Oct. 4 1924	Oct. 11 1923
	Cts.	Cts.	Cts.
New York	20.5	21.8	26.3
Chicago	18.9	19.8	25.0
Boston	21.5	22.0	27.5
San Francisco	19.2	18.6	26.1
Wisconsin Boards	19.2	20.0	24.7

The receipts of cheese at these markets were 4,883,340 lbs. for the week as compared with 3,988,332 lbs. last week and 4,783,548 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were firmer during week ending October 11. Scarcity of fancy butter was partly responsible for reaction despite sentiment for lower prices in view of heavy storage surplus and heavy current production. Exports were also a contributing factor. Approximately 7,000 tubs were shipped during the week.

The average wholesale prices on 92-score butter for the week ending Oct. 11, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Oct. 11 1924	Oct. 4 1924	Oct. 11 1923
	Cts.	Cts.	Cts.
New York	38.5	38.5	46.7
Chicago	37.5	36.5	46.2
Philadelphia	39.4	39.3	47.7
Boston	38.3	38.2	46.8
San Francisco	39.7	39.0	48.1

The receipts of butter at these markets were 13,481,952 lbs. for the week as compared with 13,289,001 lbs. for last week and 9,530,751 lbs. a year ago.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on October 1, figures being given in thousands of pounds (000 omitted):

	Oct. 1 5-yr.-av.	Oct. 1 1923	Oct. 1 1924
Butter, creamery	103,623	96,117	153,271
Cheese, American	58,677	62,384	73,087
Cheese, Swiss	4,634	5,135	8,079
Cheese, Brick	1,657	3,037	1,534
Cheese, Limburger	1,207	1,677	1,131
Cheese, all other	8,956	6,558	7,361

These holdings include stocks in both cold storage warehouses and packing house plants.

Wisconsin August Milk

The Wisconsin Department of Agriculture announces that the farmers of that state received an average of $1.61 a hundred for milk as compared with $2 a year ago, and $1.63 the previous month. Prices ranged from $1.34 in Langlade County to $2.45 in Kenosha County. These prices are the average price received for milk for all purposes, including sales to distributors, creameries, cheese factories, and condenseries.

CHICAGO, Oct. 20—Butter—Wholesale prices at Chicago: Creamery extras (92-score), 37c; extra firsts (90 to 91½), 36@36½c; firsts (88 to 89½), 31@32c; seconds (83 to 87), 29½@30c; standards (centralized, car lots, 90-score and better), 33c.

FOND DU LAC, Wis., Oct. 17—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 19½c; Twins, 19c; single Daisies, 19¼c; double Daisies, 19¼c; Longhorns, 19½c; square prints, 20½c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Oct. 18: Single Daisies, 17c. On Farmers' Call Board, Oct. 17: Single Daisies, 17⅝c; Longhorns, 18c; square prints, 18½c.

MILWAUKEE, Oct. 20—Creamery extra, tubs, 37c; standards, 34c; extra firsts, 33@33½c; firsts, 31@32c; seconds, 29@30c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 41@42c; ordinary first (standard cases), 37@38c; miscellaneous lots, shippers' cases returned, candled, 35@37c; seconds, dirties, 26@27c; checks, 25@26c.

Cheese—American full cream, Twins, 18½@19c; Young Americas, 19½@20c; Longhorns, 20@20½c; Daisies, single, 19@19½c; squares, 20@20½c; American, 32c; Pimento, 34c; Swiss 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

NEW YORK, Oct. 20—Butter—Unsettled; receipts, 5,134 pkgs.; creamery higher than extras, 38@38½c; creamery, extras (92-score), 37½c; do, firsts, (88- to 91-score), 33@37c; packing stock, current make No. 2, 27c.

Eggs—Irregular; receipts, 7,275 cases; fresh gathered extra firsts, 48@52c; do firsts, 40@47c; do seconds and poorer, 33@39c; nearby hennery whites, closely selected extras, 79@82c.

Cheese—Easy; receipts, 78,218. State whole milk flats, fresh fancy to fancy specials, 19½@21c; do average run, 18½@19c; state, whole milk flats, held, fancy to fancy specials, 20@22c; do average run 19@19½c.

Mudcura Holstein Herd Sold

The dispersion of Dr. H. P. Fischer's Mudcura Farm Holstein herd at Shakopee, Minn., Oct. 11, was very successful. The herd was in good condition, the sale was well staged, and when it was over we believe both the buyers and the seller were satisfied.

Sixty-one head sold for $24,505 with six animals going to four figure prices and the entire lot averaging $401. The good cows and herd sires were in demand at very fair prices, but yearling heifers and younger animals did not as a rule sell quite as well as at some other sales. Buyers from seven states took the cattle with the majority going to Minnesota men, although Hollyhock Farms, Wisconsin, and R. V. Rasmussen of Illinois purchased seven of the best ones.

The highest price of the sale, $2,500, was paid by Mr. Rasmussen for Duke's Mixture, a 3-year-old son of Duke Pietertje Korndyke Ormsby from that great cow, Princess Aaggie Polkadot De Kol, twice over 1,300 lbs. of butter in a year and twice over 31,000 lbs. of milk. "Princess" herself was purchased for $1,525 by F. W. A. Vesper of Missouri.

Duke Pietertje Korndyke Ormsby 31st, three-year-old show son of Duke Pietertje Korndyke Ormsby, went to Theo. Filk, Minnesota, for $1,975.

Top price for a female was $1,650 paid by Hollyhock Farms, Wisconsin, for Onyx Maid Ormsby, a very good 1,000-lb. daughter of Sir Ormsby Hengerveld Korndyke.

Mack, Scott, and Hanson did the selling with Wood in the box. The Twin City Pedigree and Service Co. managed the sale.

The following list includes those animals selling for $400 or more and buyers:

R. V. Rassmussen, Illinois	
Duke's Mixture	$2,500
Queen Concordia Mudcura Girl	600
Aaggie Mechthilde Mudcura Girl	750
Onyx Maid Mudcura Mixture	500
Oakwood Piebe Allie	1,000
Theo. Filk, Minnesota	
Duke Pietertje Korndyke Ormsby 31st	$1,975
Piebe Korndyke Clothilde 2d	425
Polkadot Rag Apple De Kol	600
F. W. A. Vesper, Missouri	
Princess Aaggie Polkadot De Kol	$1,525
Jenny Polkadot Mudcura Aaggie	760
Lady Jeslet Piebe	450
Highland Ormsby Dot	435
F. E. Murphy, Minnesota	
Princess Aaggie Polkadot De Kol 3d	$515
Queen Pietertje Aaggie Changeling	400
George C. Sherman, Minnesota	
Queen Rag Apple Mudcura Girl	$400
Pietertje Aaggie Ormsby Mercedes	400
Hollyhock Farms, Wisconsin	
Peggy Colantha Ormsby	$1,600
Onyx Maid Ormsby	1,650
Ed. H. Ulrich, Minnesota	
Female No. 20	$460

Milk Record Sheets

For years Hoard's Dairyman has been preaching the necessity of keeping records of the production of each cow. Only by knowing how much milk each cow actually gives is the dairy farmer able to improve his herd. Our Book Department has various sizes of milk record sheets to make it easy to keep tab on your cows. Complete samples with price list will be sent for 5 cents in stamps. Address Hoard's Dairyman, Fort Atkinson, Wis.

Financing Purchase of Cows

Three plans have recently been suggested by the Colorado Dairy Development Committee, of which Mr. D. W. Thomas of Denver is chairman, for successfully financing men who wish to purchase dairy cows.

These plans are as follows:

Straight Farmer-Banker Loan: Banker advances money for purchase of cows, taking farmer's note. Farmer pays what cash he can down and reduces his note by applying half of every cream check, or by paying a fixed amount per month until the cows are paid for.

A Community Plan: A revolving fund is provided by merchants and business men furnishing accommodation notes in denomination of $100 or $200, without interest, payable on demand. These notes are to be used as collateral security for a loan from the local bank.

The community selects a financial secretary and places him under bond. When the secretary collects sufficient accommodation notes for the purchase of a shipment, these notes are taken to the bank for a loan. The money is turned over to the purchasing agent to buy the cows.

The cows are purchased for specific farmers on orders given by these farmers. The farmer, upon receiving the cows, gives his note for the purchase price of the animal, plus the expense of getting the cows into his community. Only the actual cost should be charged the farmer. This is not a money making scheme.

The farmer pays part cash down if he can but is required to apply half of every cream check to repay his note. As the farmer's notes are taken up the collateral accommodation notes are returned to the financial secretary who collects enough notes to secure another loan from the bank for another shipment. The process is thus repeated.

A Loan Association Plan: Local people organize a dairy company with authorized capital of $10,000 and $2,500 of this capital is actually paid in and invested in U. S. Certificates of Indebtedness or U. S. Liberty Bonds. This investment is pledged as security to a loan with a live stock loan company up to $20,000. The local dairy company should require a down payment upon each animal, particularly if dairy stock does not freshen within four or five months of purchase. A payment of half of each cream check should be required to reduce the loan after the second full month after purchase or production. In lieu of half the cream check, arrangements should be made for monthly payments approximating that amount.

The indebtedness to the Live Stock Loan Company should be secured by a chattel mortgage upon the dairy cattle, together with a contract, or copy of the contract of sale from local dairy company to the individual farmer.

The title to the dairy animal remains with the local dairy company until the dairy stock is paid for by each individual. The local dairy company is thus protected without undue delay and legal difficulty by being in a position to take back from any farmer, who fails to make his payments or properly care for the stock, the dairy stock which he has and enables the dairy company to dispose of the animals to someone else who can and will care for them properly. The rate of interest to the dairyman should not exceed eight per cent.—H. R. LASCELLES, Fieldman for the Colorado Dairy Commissioner.

MOVABLE FENCES HELPFUL TO THE FARMER

Where a farmer might want to change feeding grounds for small numbers of animals or where a few animals might be kept in certain advantageous places for observation a movable fence would be of value. In this fence wire fencing is used and sections of cast iron pipe form the fence posts. Near the top and bottom the iron posts eyes are placed and through them a metal rod is inserted which serves to hold the wire netting in place. By using the cast iron piping it is possible to remove them and replace in desired positions with the minimum of trouble for no digging holes for posts is required. A few blows from a mallet or sledge would drive the piping a sufficient distance into the ground for stability.—ALLEN P. CHILD.

Carload Prices of Hay, Straw, and Feed, Oct. 11, 1924

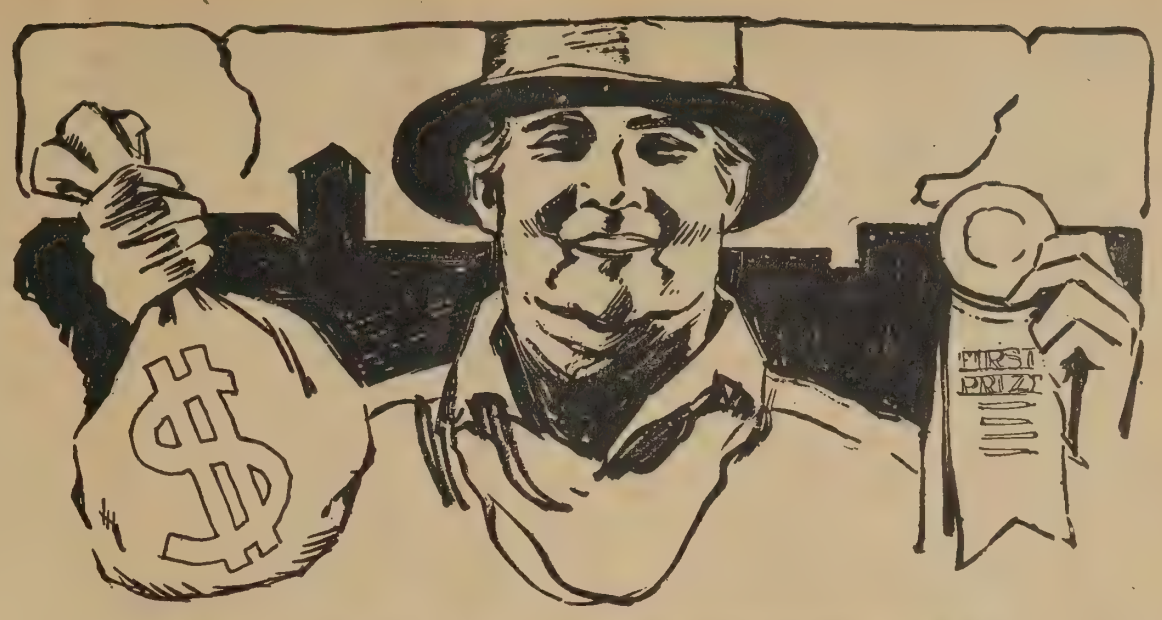
Marlow and Randall Sell Their Holsteins



The Mankato Holstein Co. herd of 95 head was sold October 8 and 9 at Mankato, Minn., for $25,440, an average of $270 with $1,025 the top figure. F. E. Murphy of Minnesota paid this for a junior herd sire, Mankato Floa Ormsby Korndyke Lad, a son of Mankato Floa Ormsby Mercedes, 1,051-lb. two-year-old daughter of S. P. O. M. 14th. Top price for a female was $1,000 for Ruby Karen Mercedes, also purchased by Mr. Murphy. He bought her 30-lb., 956-lb. daughter for a like sum.

The better animals of the milking herd were in this instance less appreciated by buyers than were the yearling heifers that sold readily for $150 to $250 and even higher in several instances.

Mack, Hanson, Krause, Scott, & Wood did the selling and the Twin City Pedigree & Service Co. managed the sale.

The following list includes those animals selling for $250 or more and buyers:

F. E. Murphy, Minnesota	
Mankato Floa Ormsby Korndyke Lad	$1,025
Ruby Karen Mercedes	1,000
Ruby Karen Mercedes Ormsby	1,000
Miss Pietertje Burk	425
Mankato Floa Ormsby Mercedes 2d	410
Cornucopia Corona 2d	325
Mankato Corona Ormsby	310
Mankato O. K. L. Olathe	280
Mankato O. K. L. Feronia	300
Sir Rhoda Kentucky Segis	330
E. A. Barthelemy, Minnesota	
Mankato Ruby Karen Mercedes	$500
Mankato Floa Ormsby Mercedes	700
Mankato Lassie Ormsby 2d	275
Mankato O. K. L. Blanche	475
Mankato Ruby Mercedes	360
Geo. F. Hanney, Minnesota	
Mankato Ormsby Pet	$415
Mankato Miss Ormsby	415
Geo. W. Edmonds, South Dakota	
Mankato Ruby Marathon Ormsby 19th	$500
Arthur C. Rosen, Minnesota	
Mankato Ormsby Mercedes Lad	$350
L. P. Emmerick, Virginia	
Bess Ormsby Maid	$500
H. L. Sohre, Minnesota	
Belle Pietertje Mercedes Ormsby	$410
A. T. McLennan, Wisconsin	
Snooks Nig De Kol	$300
J. M. Breman, Minnesota	
No. 30—Male	$295
Detroit Creamery Co., Michigan	
Mankato Segis Ormsby Bess	$750
M. Sandeen & Sons, Minnesota	
Mankato Ruby Marathon Ormsby 18th	$435
St. Olaf College, Minnesota	
Mankato O. K. L. Blanche 2d	$300
Mankato Ruby Ormsby Pauline	230
Edw. & Emil Youngbloom, Wisconsin	
Mankato O. K. L. Lilith	$250
J. J. Rosenair, Minnesota	
Mankato O. K. L. Lizzie	$370
Ernest Paul, Minnesota	
Mankato Ruby Ormsby Burke	$400
O. N. Nelson & Son, Minnesota	
Mankato Ormsby Mabel	$255
Ernest Soyler, Minnesota	
Mankato Ormsby Jean	$260
G. A. McCargan, Minnesota	
No. 68—Male	$255
W. A. Beeder, Minnesota	
Christgau Korndyke De Kol	$330
Fred C. Steele, Minnesota	
Queen Homeland De Colantha	$295
H. E. Lippman, Minnesota	
Viola Aaggie Cornucopia Segis	$250
Pitch & Paul, Minnesota	
Minnehaha Sir Pietertje Ormsby	$525

PROFITS! RECORDS!

From Grade Cows or Pure-breds

It's a feather in the cap of any dairyman to own a champion cow in any breed or class. But no dairyman can afford at any time to take his eyes off profits. When all is said and done, the value of a dairy cow depends on her ability to earn money for her owner.

Right feeding is the biggest single factor in this business of getting from a cow all that she is capable of producing.

To make money from milk you must use a feed that builds and maintains health and condition—that brings cows quickly to peak production and keeps them there.

Larro does this. Larro has many splendid milk records to its credit; but it is more significant that dairymen who use Larro consistently also produce milk profitably. This can be done with grade cows or pure-breds alike.

There is a grade cow on the Larro Research Farm that in two years increased her milk yield from 5,851.2 lbs. to 13,157.1 lbs. for corresponding 270-day periods. There is another grade cow in the same herd that produced 13,646.4 lbs. milk the past year—yielding 3.2 lbs. of milk for every lb. of grain she ate.

Take Sadie, champion grade cow of the South, who produced 23,245 lbs. milk and 1,144.9 lbs. butter in a year. She is Larro-fed. Or, among pure-breds, the Meadowbrook herd of Jerseys at Jeanette, Pa.—a herd of 50 cows fed no grain but Larro—which holds 45 Register of Merit records and is lead by Prince's Rose of Meadowbrook, with14,292 lbs. milk and 639.5 lbs. of butter fat—a state record.

Production like that is profitable—whether it comes from grade cows or pure-breds—whether the cow ever sets a record or not.

You are milking cows to make money. They'll make the most money on Larro.

Order now from your nearest dealer.

Diplomas Recognizing Owners of 300-pound Herds

HOARD'S DAIRYMAN:—The day set for the distribution of diplomas to those who had promised to come and receive them at the recent National Dairy Exposition held in Milwaukee, Wis., came up very cold and tremendously disagreeable to those who were congregated in an unheated room on the state fair ground, so that everyone seemed more anxious to get out in the air where it was less cold than be housed up and chilled. The meeting as originally planned, to be presided over by Ex-Gov. Frank O. Lowden of Illinois as a conference of dairy cattlemen, was hurriedly conducted and very few gathered after the noon recess for the purpose of distribution of the diplomas. However, those who came received theirs and many called at the secretary's office on the ground during the period of the show to receive their diplomas.

The diplomas were all made out in line with the information received from the cow testers from various parts of the country, and while the whole thing was founded upon the desire to have the men who own cattle that have been brought up to this degree of production present to receive their diplomas at the National Dairy Exposition, yet this year they will be sent on to the cow testers reporting those entitled to the award. Hereafter the strict letter of the law will be followed—that the owners of herds developed to 300 pounds butterfat production shall personally call for their diplomas some time during the exposition each year.

The cow test association exhibit at this year's National Dairy Exposition was the greatest message ever put out on the value of cow test association work but the unfortunate part of the whole exposition was that so few of those who needed an object lesson of this kind came under the inspiration of the exhibit. However, everything that our organization can do to further the splendid work that the cow test associations are nationally doing will be done.

W. E. SKINNER, Mgr.,
National Dairy Show.

Australian Kangaroo Brand

A national brand for Australian butter and cheese has been adopted by the Australian Dairy Council. It has also been decided upon a reduction of the fat standard for butter exported to countries which do not maintain a fat standard of over 80 per cent. The brand adopted is the word "Kangaroo", which will be applied to all butter graded at 92 per cent or over, which is the product of pasteurized cream, and to all cheese grading 32 points or over. "During the past few weeks only has the output been below the home consumption requirements," states Assistant Trade Commissioner Elmer G. Brady in a report to the Department of Commerce.

A deputation representative of the butter industry waited upon the Prime Minister to protest against the proposed scheme of butter stabilization and price fixing. They wish the government to consider the advisability of granting bonuses on butter and cheese, and a reduction of export freights, as well as the matter of exchange between Australia and London.

POULTRY On The DAIRY FARM

J. B. HAYES

The Medicine Cabinet

There are more brands of sure-fire, never-miss cure-alls on the market for poultry than for all the rest of a farm's inhabitants. A hen seems like such an unassuming, unknown proposition that the owner likes to pour a new material into her, whenever the opportunity arises, just to see what the result will be.

The information concerning poultry diseases which he possesses is often limited and every ailment or sudden death is sure to be serious. The first effort in eradicating the trouble is always from a muchly scented box of some mixture. In many cases, the results are satisfactory and the treatment is lauded. In fact, that single instance is very likely to remain in his mind for all time and prompt a repetition in the next case.

In about one-half the cases where sudden deaths occur in the flock, no medicinal treatment would have been satisfactory. The cases of hemorrhage are not rare and usually occur in a flock during a period of heavy production. In the other half of the cases the wrong treatment is generally administered.

Most of the medicines that are really required for a flock are relatively simple in nature and application. If one can have on hand some castor oil, Epsom salts, and permanganate of potash, the principal needs are filled.

In doctoring a hen, a pretty safe rule to follow is—when in doubt give castor oil. That is probably an unnecessary statement to make for we all know from experience that the active poultry caretakers gave us all more than we thought was our share.

One of the noted poultrymen has made the statement that the hen carries her health certificate in her head. The first indication of intestinal or digestive disturbance is noted by a darker color to the comb. When an individual is found with a purple comb and a slight diarrohea it does not necessarily mean that cholera is present but may be any one of a multitude of other things that are directly responsible.

When hens appear listless, inactive, and even die, it is not a positive sign that some serious outbreak of disease is manifest. Eating decomposed flesh, access to lead paint, drinking stagnant, contaminated water, or other similar cases may cause that condition.

In every instance such as this, one should administer castor oil to the individuals and Epsom salts to the flock. About one teaspoonful of castor oil is the correct amount. If the fowl is held securely and the oil slowly given, no struggling or choking will result.

Epsom salts for the entire flock acts as a mild physic that will alleviate the lesser complaints. This material can be given at the rate of one pound to one hundred adult fowls, and proportionately for younger birds, either in the drinking water or mixed with a moist mash. As a general toning up process the salts will be found very satisfactory.

Even during the winter months when flocks are closely confined, the salts may be given at regular intervals every month. This seems to be especially true when the green feed allowed them is rather limited but may be given under any conditions.

At about the time that the cold, fall rains become a regular weekly event, one can expect to find colds, roup, chicken pox, and canker developing at the same rate. Part of this trouble is due to lack of vitality in immature stock, partly to allowing them to roost out in exposed places after they should have been housed, partly to lack of sufficient ventilation in the poultry house, and great deal to overcrowding in the chick brooding house that cannot adequately accommodate them.

In all cases the cause should be found and corrected before attempting medicinal treatment. An even safer rule to follow is elimination by getting the stock into clean, well ventilated quarters earlier in the season.

About fifteen cents' worth of permanganate of potash should be purchased at the drug store. This material is a purple crystal that dissolves readily in water. Place this amount in a bottle, add enough water to dissolve, and keep on hand as a saturated or stock solution. In other words, all of the material is held in solution that the water can carry.

Each day add enough of this to the drinking water to give a pink or wine color. In cases of severe outbreak, this material will not be a cure but no other could do that either. It will, however, act as a partial disinfectant in preventing the spread from one fowl to another through the drinking water. The continued use of it will not cause any harm but it is not needed except when a cold is noted. If the affected individual is a weak, small, late hatched bird, kill her and give the rest of the flock a chance.

BARRED PLYMOUTH ROCK HENS AND NEW PURDUE TYPE POULTRY HOUSE ON HERBERT DAVIS FORESTRY FARM, INDIANA

Ailing Turkeys

Please tell me what I can feed my turkeys; they are half grown and then get sick. We feed them milk and cheese and wheat.

Dowagiac, Mich F. F.

It is probably not a question of what the turkeys are being fed so much as the condition which is responsible for the loss. Instead of giving a ration the responsibility, there are a number of things that might be the cause of this condition. In the first place, the turkeys may be affected by lice, and although one is always sure that such is not the case, they can be present in large numbers and result in lowering the vitality of the young stock.

If the housing conditions are not proper, that is, not well ventilated or infested with mites, this, too, can be responsible for the loss.

Turkeys should also eat an abundance of green feed. If they are allowed to range with the chickens, they are probably running on contaminated soil, are not being fed the way that they should and the overfeeding that results from this can kill them. We find that more turkeys are lost through overfeeding than through underfeeding. If they have access to a grain field, it means that they are getting more than their share of feed without sufficient exercise. If corn is reaching somewhere near a stage of maturity, this is also one of the things that causes a heavy loss in them. I should advise you to continue with the same ration which you are giving and in addition give an abundance of green feed, house them properly at night, and if the condition doesn't correct itself, have one of the birds sent in for the disease.

Sanitary Measures

Cleaning the poultry house at this time of the year before placing the stock in winter quarters will eliminate most of the common poultry diseases. A dirty, dark house tends to lower the vitality of the fowls and makes them more susceptible to disease. The value of the individual in poultry is so relatively low that measures to prevent disease must be followed rather than treatment after the epidemic appears.

The most practical, economical, and satisfactory method is to whitewash the house. An application of whitewash tends to make the interior of the house lighter, destroys parasites, and disinfects the house. There are several different methods of preparing the solution. The following has been found to be satisfactory: Slake quick lime with enough water to make a thick paste. While slacking add a pint of melted lard or other grease and a cupful of salt to a bushel of lime. Add enough water to bring the solution to the consistency of thin cream and strain through a piece of burlap. It is also advisable to add 4 ounces of crude carbolic acid or some coal tar disinfectant to every gallon of the solution.

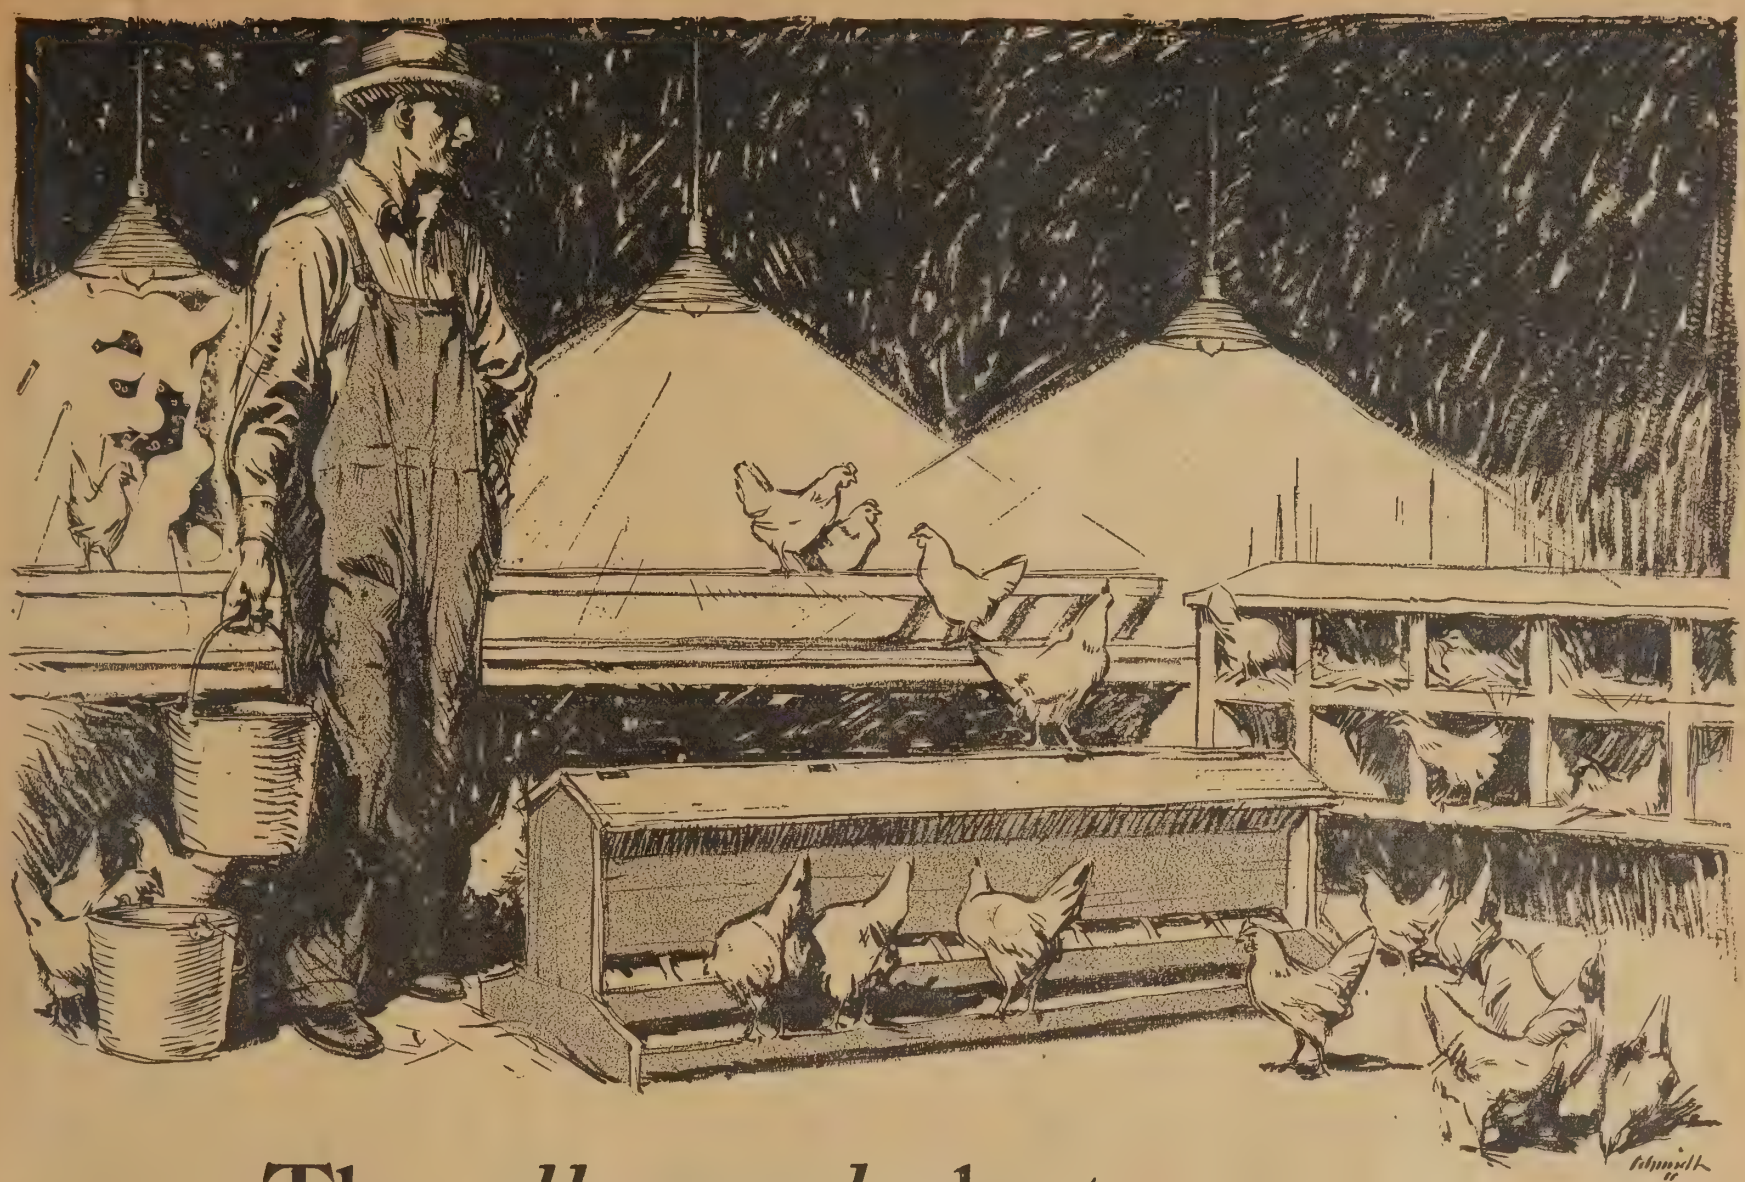
Before applying the whitewash it is necessary to clean the house thoroughly, remove the furnishings, and clean the floor. The addition of air slaked lime to the floor, dropping boards, and ground immediately surrounding the building is advisable. Using dry road dust, ashes, or lime on the dropping boards after each cleaning during the winter will increase the ease of removing the droppings.

Who Said They Didn't Pay?

Away up in the woods of northern Wisconsin, located back on a road that even a county agent's car couldn't travel, is a little settlement of farmers. They are trying to make crops replace stumps and every form of agriculture is followed. The equipment which they have at their disposal is crude and simple as some of them are still living in log houses. They have found that poultry plays an important part in giving them a cash crop each month through the sale of eggs at the nearest market.

When the county agent, through the local papers, told that a number of culling demonstrations would be given in that section they immediately asked for a meeting. One of the more progressive persons had taken a crate of hens to the market but upon hearing that the agent would be out in a few days had hauled them back home to be sure that the poor producers were sold.

Mr. and Mrs. Peterson submitted a record of the profit that they made from their flock of 48 Barred Plymouth Rocks. The record follows:



Month	No. eggs produced	Cost of feed
January	383	$ 2.20
February	636	10.35
March	762	8.17
April	1095	11.87
May	1144	8.75
June	929	13.40
July	759	3.98
August	824	2.78
September	274	7.80
October	182	
November	51	6.15
December	28	7.80

Total 7,047 eggs. Average production 146.8 eggs per hen.
Cost of feed per hen $1.75.
Value of eggs $5.68.
Return over feed per hen $3.95.

The hens were fed one of the regular home mixed mash feeds of ground feed, bran, middlings, and meat scrap when milk was not available. The scratch feed consisted of cracked corn, wheat, and barley. All grain and mash fed directly to the flock was charged against them and the sale of broilers, roasters, and surplus young stock would offset the charges on grain picked up around the farm that would have been wasted.

Housing facilities were very ordinary except that all the essentials of proper lighting, ventilation, dryness, and prevention against sudden changes in temperature were embodied. They did not use artificial light last season but planned in increasing the size of the flock and possibly using gasoline lanterns for a few winter months. It was not the equipment that assured them of success but they had a laying strain of Barred Rocks that were properly managed, fed, and handled. Any other farmer or city lot poultry keeper can duplicate this record with attention to the little details.

The average production of 146.8 eggs per hen is not phenomenal but is double the average of 70 eggs per year set by the American hen. The higher the average production the lower the cost of production. This is a second reason for their success and is a cause that is often overlooked. Cull the flock to select the breeders, breed from a high production bred male bird, and discard slow developing, immature, late hatched pullets in the fall. This system is followed by that group of farmers and eggs are growing on cut over land along with the other farm crops.

The *all-round* plant for every electrical job

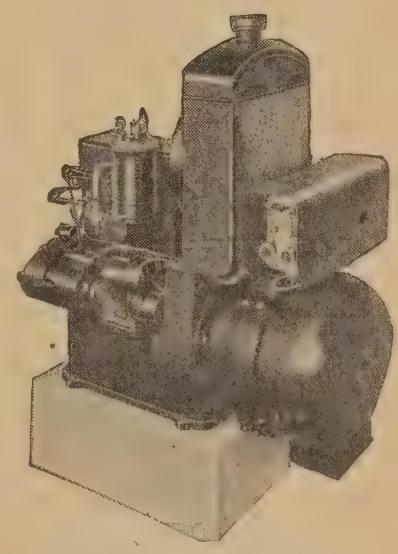
EGGS may be just a side line with you. But even so, making money is never a side line; and you naturally want your flock to pay you maximum dividends.

Then electricity can help you. Electrically lighted poultry houses are a proved, profitable investment. And many a man has found that *direct returns in more eggs* will pay for an electric plant.

Some of the most enthusiastic owners of Kohler Automatic Power and Light Plants use electricity to increase poultry profits. These owners especially admire the Kohler Automatic's ability to deliver ample current for this purpose *almost without extra expense*, simply as part of its big job of providing for every electrical need of the modern farm.

This all-round plant can do more work because it *does not need storage batteries* (except a small starting battery); because its full rated capacity is always on tap; and because it delivers current direct from the generator, without waste.

The current is 110-volt. That insures brilliant light; permits wiring distant, scattered buildings; and operates standard appliances.



Fully automatic operation gives press-the-button convenience and saves trips to the plant when power appliances are in use.

All Kohler Automatics offer these exclusive advantages. There are models to serve every need, from 800- to 2000-watt capacity; all sold on convenient payments.

Send the coupon below for the Kohler Automatic booklet if you want to *get more out of electricity*—more help with your work, more solid comfort; but less trouble, less expense.

"AFTER nearly three years' service I am pleased with my choice of a Kohler and have found it very satisfactory, economical and efficient. It supplies me with ample light for my home and yard as well as lights for poultry houses housing 1200 hens. An electric iron, fan, vacuum sweeper, and egg candlers are some of the extra uses I make of the plant."

Wanted—By November 1, single man, a good milker and all around farm worker and good teamster. Guernseys. Must be clean and reliable. State age, wages in first letter. LUEDKE GUERNSEY DAIRY, Juneau, Wisconsin.

POSITION WANTED

Wanted—Position as farm manager or superintendent of large grain and stock farm. Understand farming in all its branches; had years of experience with show cattle, horses and the dairy. Able to manage any sized farm and help. Married, middle aged, honest and reliable. High personal references. Address BOX 314, care Hoard's Dairyman. 14-2

Fireman, Brakemen, for railroads nearest their homes—everywhere; beginners $150-$250 monthly (which position?) Railway Association Desk W-5, Brooklyn, N. Y. 12-4

Men—Age 18-40, wanting Ry. Station Office positions, $115-$250 month, free transportation, experience unnecessary. Write BAKER, Supt., 124 Wainwright, St. Louis. 8-*

Wanted, by November 1, position on dairy farm. Good dry hand milker and feeder. SIDNEY EELLS, Spring Valley, Wis.

Herdsman open for position at once—Seven years experience. Holstein A. R. S. O. Guernsey A. R. up to 625 lbs. fat class F. Not afraid of work. References. Two years Agricultural College. VERNON WOEBSE, Care Minneborya, Drewery's Bluff, Virginia.

Position Wanted—Small dairy farm or milk route work. Single, 25, experienced, temperate, energetic, kind to animals. References. State wages and requirements first letter. Address BOX 326, Care Hoard's Dairyman.

Wanted—Position farm manager, 45, married, three children; years of experience, dairying, general farming and handling pure bred stock, also tractors and machinery; employed now, best references. Route 1, BOX 55, Downers Grove, Ill.

Position Wanted—Single man with 9 years experience as Danish buttermaker. Received training in the old country and is fully experienced. Can furnish the best of references upon request. Anxious to start work at once. Address HENRY SCHMIDT, Care Christ Schmidt, 925-13th, Belle Plain, Iowa. 15-2

Wanted Position in milk room by single experienced hand. State wages. Address BOX 327, Care Hoard's Dairyman.

Middle aged man wants place as herdsman. 20 years experience with dairy cows. Can give best references. Address BOX 325, care Hoard's Dairyman.

Market for Cheese in South Wales

American cheese was well known and popular in South Wales years ago, but has now practically disappeared from the market, states Consul A. B. Cooke in a report to the Department of Commerce based on interviews with wholesale merchants. One large dealer says that of late years American exporters have been quoting only a second-grade cheese (not made of whole milk) and that as this market demands a whole cream cheese, it has not been possible to handle the American product offered. Another merchant states that the Canadian product has supplanted the American cheese on this market because of the richer quality of the Canadian cheese.

South Wales is distinctly an industrial area, the population being made up largely of coal-mine workers and workers in various metal industries, as well as sea-faring men. The people consume large quantities of cheese regularly throughout the year. The demands of this market are met by the domestic output and to a considerable extent by imports, principally from Canada and New Zealand, the supplies from these two countries being seasonal and supplementing each other, the Canadian cheese coming on the market from September to March and the New Zealand cheese from April to September. A small amount of Dutch cheese is also handled, but the demand for this article does not seem to be growing. The cheese imported from Canada and New Zealand is a rich milk Cheddar of about 80 lbs. weight. It is asserted by the trade that the large size of the cheese is an advantage, because the article tends to ripen much better when in such bulk than when in smaller forms.

Tom Tarheel says that the only way to improve the soil in a large field is to grow and turn under legumes.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

Washington, D. C., October 21—The appointment of the Agricultural Fact Finding Commission by the President is still deferred, and he has had two outstanding farm organization leaders here in Washington during the past week to confer with him on this subject. The two were Hon. Louis J. Taber of Ohio, Master of the National Grange, and O. E. Bradfute of Ohio, President of the American Farm Bureau Federation. Both of these men advised President Coolidge not to call a commission of this kind together until after election. Both feared the influence of partisan politics on its deliberations. It is also stated that they advised the President that the increasing prosperity of mid-western farmers had relieved the urgent necessity for agricultural action.

⚜

Attention in Washington is centered on election prospects and possible results, rather than on either agricultural or business conditions at this time. Even the announcement of the German loan and its large success failed to do more than to awaken political speculation as to its influence on the chances of President Coolidge's re-election. Professor Hirsch, a prominent German economist who is here unofficially on a study trip, speaking to the Farm Hands Luncheon Club here on the day the loan was floated, declined to discuss its possible effects further than to say that it meant the continued stabilization of German currency which was a prime factor, in his estimation, in the resumption of normal industrial conditions in Germany. This in turn meant increased consumption of foods and fibres, and an increasing demand from Germany for these products. He said Russia would not be in position to supply very great amounts for some years to come. The picture painted by Professor Hirsch of the unusual effects of their currency depreciation on the agricultural people, leading to the payment of all debts and the purchase and use of vast quantities of fertilizer and agricultural machinery, was most interesting. With the restoration of a stable currency by the device of the roentenmark, he said, while it had made industrial business and banking development possible, it had at first resulted in great losses to agriculture and to a sudden throwing of agricultural products onto the market, so for a time there had been lower prices in Germany for most foodstuffs than anywhere else.

All of this has a large effect on the dairy situation, for it means that for a time at least the consumption of foreign butter in Germany was checked. As industrial recovery proceeds, however, Germany may be expected to come back into the market for large quantities of Danish, Holland, and Russian butter. At one time, Professor Hirsch stated, in Berlin there was just one barrel of butter during the food shortage which existed in 1920. Weather conditions, he stated, had been most unfavorable during the present year which, providing industrial conditions go on the up grade, will also make Germany an importing nation for foodstuffs during the coming winter.

⚜

The co-operative marketing situation is receiving still augmented attention here just now, preliminary to the consideration of bills on this subject in Congress. The Tincher bill has been brought up again and appears to have strong agricultural department support. It is expected that the House Committee on Agriculture will start hearings on these bills early in September.

⚜

The Agricultural Situation, published by the Bureau of Agricultural Economics, discusses the dairy situation at length in the current issue. It is figured that there has been an increase in the consumption of butter this year over last by the rather imposing amount of 4,135,000 lbs. a month. The domestic production increase has been at the rate of about 10,500,000 lbs. per month. There is an increase in cheese consumption of over two and a half million pounds a month over last year.

A study of price indexes which your correspondent has just completed shows that for the first time in many months hogs are well above 100 and corn and wheat price indexes are higher than the price index of butter, for the first time since 1921. The lines crossed in June and July and the difference especially in favor of corn is very marked at this time.

SALE ANNOUNCEMENTS

Oct. 27-28—Holsteins. Otter Tail County Sale, Fergus Falls, Minn.
Oct. 28—Wells & Smith Dispersal Sale, 26 Jerseys, at Prairie Farm, Wis. Hugh A. Feagle, Barron, Wis., Sales Manager.
Oct. 29—Postponed Sale Montgomery County Holstein Breeders' Ass'n. at Rockville Fair Grounds, Rockville, Md.

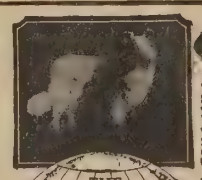
The Modern Farmer's Interest in the Old Dutch Process

AS the name indicates, the Old Dutch Process is centuries old. Today, it is still the best process, though not the cheapest one, for the production of White Lead.

Send for "The Farmer's Eagle" —A Guide to Farm Painting

Eagle White Lead in Oil has been a Pure Old Dutch Process White Lead ground in pure linseed oil, since 1843.

The qualities of smooth and easy application, durability and long continued whiteness are developed during the ninety days that Eagle White Lead is forming in the corroding pots in the tan bark beds.



Eagle White Lead takes longer to make, but it lasts longer on the finished job.

Interest yourself in the use of Old Dutch Process White Lead on your farm; send for "The Farmer's Eagle." It is free, and useful on the farm.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Daniel Dare Discovers Weeds

Foreword: Several answers to the problem stated about silage in the last chapter of the "Adventures of Daniel Dare" have been offered, but so far Danny himself is the only one who has the correct solution. Danny, however, doesn't want us to publish his method just yet—he seems to think that some other Hoard's Dairyman Junior ought to be smart enough to present the entire solution. Danny has consented that we publish the correct answer. Therefore, the 14x30 silo will feed from 28 to 30 cows for six months. This week we find Danny playing a new role. Now go on with the story—

PERHAPS you wouldn't call Daniel Dare a discoverer, but nevertheless he felt just like one. True, he knew more than half the weeds that the agricultural teacher from the town high school was trying to teach them that day, but he was discovering a lot more about their habits, and as the afternoon's lessons progressed he was learning more about how to get rid of these troublesome plants. So he really was a discoverer.

Miss Edsel had told every member of the agricultural class to bring a weed from home so they would have some material to work with when Mr. Hamilton, the high school agricultural teacher, came out to teach weeds.

"Today, we're going to study ten weeds," began Mr. Hamilton. "We want to learn a little about their characteristics and quite a little about how to control them.

"You've heard them called noxious weeds. According to the dictionary, noxious means injurious or destructive. Now noxious weeds, like other plants, may, first of all, be divided into three classes. It is important that we do this because we must first know the plant's habits if we are to get rid of it. The first class is called *annual*, the second *biennial*, and the third *perennial*.

"If you had studied Latin these words would explain their own meaning to you. An *annual* is a plant that grows up from seed and matures more seed in one year. At the end of this time the mother plant dies. A *biennial* grows for two years, produces seed at the end of the second year and dies. A *perennial* produces seed every year and does not die a natural death. What weeds have you brought this afternoon? Let's see what classes they belong to."

Daniel Dare, being first in line, was first to show his weeds. "I have two weeds, Mr. Hamilton. One is Quack Grass and the other Canada Thistle." He held up one in each hand.

"Two very common and two very naughty weeds," said Mr. Hamilton. "Quack is a perennial and so is Canada Thistle. We'll discuss these a little more thoroughly in a few minutes. Who's next?"

Mary sat next to Danny. She shyly rose and—"I think this is Burdock."

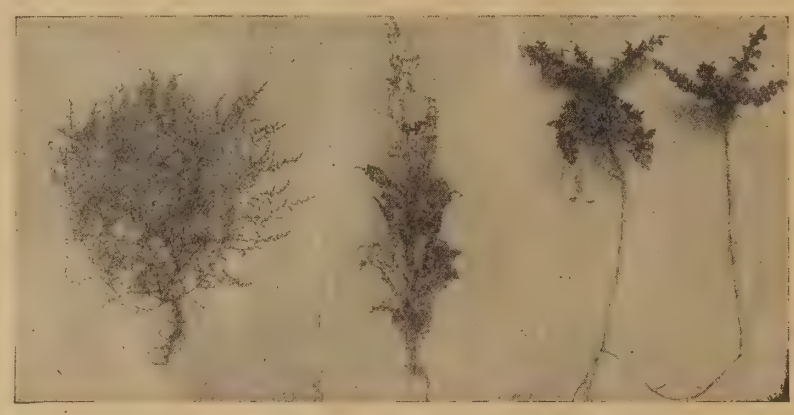
"Right! And it is a biennial. Next!"

Mark Mason shook his head. "What—no weed at all?" Mr. Hamilton appeared astonished. "I forgot," was Mark's only alibi. The class as usual was amused.

John stood up and presented Mustard to the class. Mr. Hamilton quickly identified it as an annual. No other new weeds were brought forth, but several others were duplicates.

"You have now seen examples of each class of plant that I mentioned a few minutes ago. Before I give you the other six weeds, we will discuss in a general way some methods of getting rid of weeds. Who can give me one method?"

"Cut 'em off!" John announced.



"Sure, that's one way. Only we want to be sure to cut them off before they begin to make seeds."

"Won't cultivation do it, too?" Danny wanted to know.

"Indeed it will. That's a second way. Grow cultivated crops. Of course if you don't do a mighty good job of cultivation, it's almost worse than no cultivation at all because it gives the weeds a dandy chance to spread out.

"A third way, if your field has a great many weeds in it, plow in the spring and allow it to remain idle during the summer, cultivating it regularly to get rid of the weeds. This method has the disadvantage of not making the land grow crops, but it is sometimes advisable.

"Number four, sheep are very fine weed eaters. Often they will do a lot of weed damage to a field in one season. They are very good for Canada thistle if they are turned on when the thistles are very young. Sometimes it is necessary to pasture the same piece of ground several seasons to completely kill the weed growth.

Left to right: Russian Thistle, Sow Thistle, Canada Thistle.

"Chemicals have been tried and to a certain extent are successful, but not to be recommended for general use. A very important method of weed eradication is to use a smother crop such as clover or alfalfa. These crops not only tend to choke out the weeds, but as they are usually cut twice a season, sometimes oftener, the weeds do not get a chance to go to seed.

"Then there's the method known as 'spudding'. A 'spud' in this case is not a potato but a tool—with handle and a sort of chisel on the end. This is used to cut the weeds off below the surface. Now I've done a good deal of talking. I'm going to do some more, but this will be an illustrated lecture. When I was driving out here I stopped along the way and picked ten different noxious weeds, roots and all. I am going to hold each one up and talk about it. Some of the weeds are the same as the ones you have brought. Others you are probably familiar with."

Danny was sitting on the edge of his seat, he was so interested. Truly he was discovering several things he had not known before. Danny, the discoverer, was on a new expedition. The other members of the class showed more than their usual interest.

"Here is our old friend, Quack Grass. It has two ways of reproducing, by seed and by shoots from its creeping roots. Quack is a hard customer to deal with. If it is growing in small areas it is possible to smother it out by covering with tar paper. We might also summer fallow. Cultivated crops such as potatoes and corn with plenty of hoeing will also get Quack's goat.

"For your approval I present Canada Thistle and one of his cousins, Sow Thistle. Both are perennials. Note that Canada Thistle also has the creeping roots from which new plants may be produced. A smother crop such as alfalfa or clover is very effective in getting rid of these weeds. Sheep will eat them, too.

"This you see is another member of the thistle family—Russian Thistle. It is an annual. We must keep it from going to seed. Cultivation will do it!

"You all know Wild Mustard, another annual. Fight it by planting a cultivated crop, and be sure to cultivate thoroughly. You may also spray to kill this weed. But be careful not to spray in clover and alfalfa. Chances are you won't be bothered with Mustard in these crops anyhow.

"Make the acquaintance of Mr. Yellow Dock, the biennial troublemaker. He's tall and easy to see. When the seeds ripen he turns a brownish color. You can pasture this fellow and if the sheep do a good job his life will be short. Grow check rowed corn and keep it clean. Then watch Yellow Dock take to his heels.

"How do you do, Friend Burdock. We've all seen you before. You're a biennial and we don't care for your company. We'll just cut you down and salt your roots, and see how you like it.

"Hello there, are you two brothers? You look alike. Belong to the Ragweed family, don't you? You're Giant Ragweed and this is your cousin, Common Ragweed. Annual wonders, aren't you? You like to make hay fever patients sneeze. We're going to chase you out of the country. We've got a whole army of cultivators, hoes, and scythes to do it with, too. If you poke your head up in our corn, we'll chop it off.

"And last, but not least, Buckhorn. You belong to the plantain family. We aren't crazy to make your acquaintance because you're a perennial. With a spud, we will decapitate you. We will grow a cultivated crop so you'll have plenty of chance to grow and then we'll kill you before you make your seeds.

"And now, my good boys and girls, here ends your agricultural lesson for today. Learn these weeds, their habits, and how to get rid of them. Then go home, and if you're ever troubled with any of them, you'll know what to do."

The class appeared to be spellbound with Mr. Hamilton's method of presenting the weeds. Why he

Left to right: Common Ragweed, Giant Ragweed, Yellow or Sour Dock, Hedge Mustard (first cousin to Wild Mustard).

Left to right: Quack Grass, Burdock, Buckhorn or English Plantain.

made them so human they almost walked up to shake your hand. Danny was the last to leave his seat. Then he didn't go back to his own, but went up to examine more closely the weed plants he had just met face to face, and to ask a question or two. Daniel Dare had discovered weeds.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Results are often a measure of success. The methods used by good dairy farmers contain many good lessons which may mean the difference between success and failure for us. The article "From Scrubs to Purebreds in Canada" in the October 10th issue of Hoard's Dairyman is right in this line.

Why did J. G. Wait change his herd from grades to pure-breds? Keeping records did it. In 1911 he had on his farm a common, ordinary bunch of grade cows with no particular breeding. He started keeping milk records and discovered his herd averaged about 5,000 lbs. of milk. By weeding and good breeding methords he turned this grade herd into a pure-bred one producing an average of 10,000 lbs. of milk a year. In 1918 Mr. Wait joined a cow testing association.

What feeds do his cows get? About 30 lbs. of silage a day, 12 lbs. of good legume hay; the grain ration consisted of 100 lbs. each of bran, shorts, oat chop, wheat screenings, and 30 lbs. of oil meal. Mr. Wait was one of the first in his section to grow sweet clover—both for pasture and for hay.

How is Mr. Wait helping his neighbors? By selling them very fine breeding stock at low prices. He has helped them to buy feed co-operatively. He is a strong booster for cow testing association work.

At what age are calves most likely to have tuberculosis? According to a chart prepared by the Bureau of Animal Industry calves under six months are more likely to have this disease than when they are between six months and one year. One in every 32 of the younger class of calves tested had tuberculosis, while in the older calves it was found that one in every 20 had the disease.

How much has milk consumption increased in the U. S. in last six years? Forty quarts "per capita" (meaning average for every man, woman, and child). In 1918 it was 172 quarts each and in 1923 212 quarts.

How has tuberculosis eradication progressed? Eradication means to get rid of. In 1918, before a plan was adopted for carrying on this work, only 134,143 animals were tested. In 1923 this number had increased to 3,460,849.

Who is Langwater Ultimas? He is a noted Guernsey bull for which F. J. Rueping of Wisconsin recently paid $10,000. The record established for the breed by this sire is that his first six daughters to be tested, all with first calf, averaged 11,514 lbs. milk, 626.5 lbs. fat.

See the article by O. E. Reed in the Oct. 17th issue of Hoard's Dairyman for a further discussion of the following:

Where did the Ayrshire breed of cattle originate? In the county of Ayr in Southwestern Scotland. This breed has been making great progress in recent years.

Give the average production of cows in the Scottish Milk Record Society. Fully ninety per cent of the cows entered in this Society are Ayrshires. Last year 33,000 cows were tested and the average production amounted to 7,500 lbs. per cow.

How are the cattle cared for in Scotland? The cows are left in pasture for eight to ten months of the year. From December to February the cows are usually stabled and fed straw, hay, and cow turnips, and a little oil cake.

Name the Channel Islands. Jersey, Guernsey, and Alderney. These are the homes of the Jersey and Guernsey cattle respectively.

How are the cattle cared for on the Islands? They are tethered in small pasture lots. Pastures consist of a mixture of alfalfa, clover, rye, and grass. Other crops such as oats and vetch furnish pasture.

How much is Island land worth? Land sells for from one thousand to twelve hundred dollars per acre and rents from fifty to sixty dollars an acre per year largely because green houses and hot beds make the acres very productive, sometimes from three to four hundred dollars per acre.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

The Young Giant Next Door

CANADA, your progressive young neighbor on the north, is fast growing up. Do you realize what a young giant of a nation Canada has already become? Here are some startling facts:—

Canada stands fifth among the exporting nations of the world.

Canada's export trade per head of population ranks third among all nations.

Canada is the world's largest exporter of wheat.

Canada has, in proportion to population, the greatest railway facilities of any country in the world—a total of 40,000 miles in active operation.

Canada's Savings Deposits amount to an average of $146.21 per head of population.

Canada has the greatest Hydro-Electric power development in the world.

Canada is the world's largest producer of nickel and asbestos, and one of the leading producers of gold and silver.

Canadian dairy herds carried off the premier honors at the National Dairy Show at Syracuse last Fall.

Canada's production of Dairy Products has increased by $164,000,000 since 1900.

Canadian Clydesdales won the Grand Championship Awards at the Chicago International the last four years.

Canadian apples won the highest awards in the British Empire Fruits Exhibition held in England last year.

Canada's people are progressive, Canada's Government is responsible and democratic, Canada's laws are just and impartially enforced. Life and property are safe in Canada.

Canada's climate is healthful and invigorating. It is a "white man's climate"—the climate of the North Temperate Zone, in which all the dominant nations of the world are located.

Canada, one of the soundest, strongest and most prosperous countries in the world today, is destined to be one of the great nations of the earth. What the Nineteenth Century did for the United States, the Twentieth Century is doing for Canada.

Canada has 300,000,000 acres of fertile farm lands. Prices near railroads average about $15 to $20 per acre. Free homesteads are offered farther back.

Experienced Government officials of the Land Settlement Service help settlers choose suitable locations and get started right. Our free illustrated books, "Eastern Canada" and "Canada West", give you photographs, maps and full particulars. Write for one now.

Grind Your Own!

McCormick-Deering Feed Grinders

Just slip the belt of a McCormick-Deering engine or tractor on to the pulley of a McCormick-Deering Feed Grinder, give the crank a spin, and your outfit is ready to grind any quantity of stock or poultry feed you need. A few minutes on a rainy day now and then gives you the best possible feed at a low price. It doesn't pay to feed whole grain when it is so convenient to feed easily digested mixtures of ground grain. McCormick-Deering Grinders are made in styles for grinding all grains and all combinations of grains.

McCormick-Deering Corn Shellers

When you buy a corn sheller, this name will lead you to the best on the market. The McCormick-Deering line includes one-hole steel and wood hand shellers, 2-hole X-L hand or power shellers, 2-hole Keynote power shellers, 2 and 4-hole all-steel shellers, and two sizes of cylinder shellers—a style for every shelling purpose.

Ask the McCormick-Deering dealer about McCormick-Deering Feed Grinders and Corn Shellers.

The WINDMILL with a RECORD

The Auto-oiled Aermotor has behind it 9 years of wonderful success. It is not an experiment.

The Auto-oiled Aermotor is the Genuine Self-Oiling Windmill, with every moving part fully and constantly oiled.

Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet.

The Auto-oiled Aermotor is so thoroughly oiled that it runs in the slightest breeze. It gives more service for the money invested than any other piece of machinery on the farm.

You do not have to experiment to get a windmill that will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine.

Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Aermotor is made by a responsible company which has specialized in steel windmills for 36 years.

LOW OPERATING COST

FULLER & JOHNSON MODEL "N" GASOLINE ENGINE

Thousands of Fuller & Johnson engines have given satisfactory and constant service for ten to twenty years, at a very low operating cost.

That's because every Fuller & Johnson engine is constructed with sufficient weight and strength to withstand the shock and strain of continuous operation under full load. The materials used are the very finest and the highest type of engineering and mechanical skill is employed in their construction.

Write today for our free booklet 21A. It tells why it costs you less to use the best.

In The Day's Work — An Ancient Parable

ELWOOD ERICKSON, NEW YORK

"THE trees went forth on a time to anoint a king over them: and they said to the olive tree 'Reign thou over us'. But the olive tree said unto them, 'Should I leave my fatness, wherewith by me they honor God and man, and go and wave to and fro over the trees?' And the trees said to the fig tree, 'Come thou and reign over us,' But the fig tree said to them, 'Should I leave my sweetness, and my good fruit and go to wave to and fro over the trees?' And the trees said unto the vine, 'Come thou and reign over us'. And the vine said unto them, 'Should I leave my new wine, which cheereth God and man, and go to wave to and fro over the trees?' Then said all the trees unto the bramble, 'Come thou and reign over us'. And the bramble said unto the trees, 'If in truth ye anoint me king over you, then come and take refuge in my shade: and if not, let fire come out of the bramble and devour the cedars of Lebanon'."

Here is an ancient parable that portrays a modern situation. Wherever men exercise the right of suffrage some will evade their civic responsibility. It is a scathing arraignment of those smug, self-complacent citizens who reject their obligations on the discreditable plea that they are too comfortable to be disturbed. The least desirable of their number, not so solicitous of their personal comfort, ready to take advantage of their slumbering fellows, worm their way to places of leadership and impose dictatorial conditions to which the meek submit.

The parable is an indictment of the lassitude on the part of the worthy electorate in almost every community. One of the most alarming weaknesses of popular government is the failure on the part of many respected and worthy citizens to exercise their right of suffrage. Preoccupied by their own interests, lulled by their personal comforts, many of these people refuse to leave their comfortable firesides to cast their vote on election day. Some of the states have primary elections at which time a candidate is selected, yet many people do not know even the name of the candidate until the day of election arrives. They were not interested enough to go to the primary and express their preference. In one community in Ohio, well known to the writer, there were 9,000 registered voters but on election day only 3,000 votes were cast. The rest of them refused to leave their fatness and ease.

There were two interesting results in that community after the election and these results can be repeated over the entire land, for it is a typical community. In the first place, the best man lost and the least able man was chosen—the bramble sort of leader. The practical politicians counted as a dependable factor that election day would draw out a larger proportion of the undesirable vote than the vote of its respected citizens and their calculation did not fail. The good people stayed at home and the questionable element crowded to the polls and elected their man.

The other result was amusing, though serious. The man who forgot to vote became the most bitter in his denunciation of the whole system of popular government. He curses out the whole business but neglects to consider that he himself created the situation which he so bitterly criticizes.

As a matter of fact, we get just about the sort of leadership which we deserve. Just as long as the intelligent group in the community refuses to accept its civic responsibilities, just so long will public office be infested with the bramble kings. But when men will consent to set aside their personal affairs and lend a hand and at least register their thinking vote, these inefficient incumbents of office will disappear. That day is approaching. The entrance of women into the political sphere has aroused the male vote in the country to a new seriousness and we look for greater benefits in the future. Very few men will want to abide by their own comfortable firesides while their wives go out and vote for the family. "In that bivouac of life, he does not want to be represented by his wife."

We are on the eve of a national election. The highest honor that America can confer is to be given to him who shall be chosen the titular head of this great land of ours for the next four years. No higher office lies within the power of man to confer upon his fellows. An event of such transcending importance enters into the life and affairs of every citizen of this republic. It should stir the most indifferent, the most slothful to his obligation to vote. Every enfranchised man and woman in this republic, rejoicing in the duty and privilege of suffrage, will come up to the election booth in November anxious and proud to cast his or her vote for one of the fine candidates. Let not the ancient reproach of political lassitude be charged against the thoughtful, earnest electorate when this fall we select the next president of the United States.

"LIME DID IT," SAYS M. E. SMITHBACK

For 13 years this Wisconsin dairyman tried to get a stand of alfalfa. Something happened every time. Finally he had his soil tested. It was lacking in lime and phosphate. The first he applied at the rate of three tons to the acre, the latter at the rate of about 300 lbs. an acre. He inoculated his alfalfa seed and sowed. The picture above shows the result. This is the second crop in the second season.

"I'm proud of it," declares Mr. Smithback. Don't you think he has a right to be? Through his herd of some 35 registered and grade Guernseys he is going to convert this field into milk checks next winter. His herd is on the accredited list. Besides furnishing a direct income, the herd contributes to the fertility of the land and gives plant food to a crop of tobacco which in normal times brings an income of $7,000 a year.

Milwaukee Milk Producers' Association

(Continued from page 434)

making a mistake, although we believe most of them do not know that the price of special milk in Milwaukee is based upon the price of fluid milk produced by the members of the Milwaukee Milk Producers' Association. This being true, the men producing special milk should still continue to support the organization which is the instrument which determines what the price of fluid milk should be.

If all the members fully understood the service which their association has rendered to them and to those outside the association who are selling milk in Milwaukee, there would be only a few, and these would be dishonest, who would not support this organization. The average price paid for milk testing 3.5% in Milwaukee for August was $2.40 a hundred. This was equivalent to 45 cents per pound for butterfat, 50 cents a hundred for skimmilk, and 41 cents to pay for the extra cost of producing milk for a fluid market. There may be those who argue that the price of milk was not high enough. This we will not discuss, but none who are informed can truthfully say that the price was not good when all the factors pertaining to determining prices of milk are taken into consideration. Only a few creameries paid as high as 45 cents a pound for fat. A few farmers would value skimmilk at 50 cents a hundred and plenty of farmers would produce fluid milk if the price were but a little above that paid by the creamery.

We have favored certain forms of organization for co-operative marketing, but in the last analysis the plan of organization is not the great factor in success. It is the man given the responsibility of managing the organization and those associated with him who are responsible for the success of any co-operative marketing company.

Mr. G. R. Rice, the secretary of this association, has been a capable manager. He has gained the confidence of the milk distributors and they have found it to their advantage to buy milk through his association, even at a higher price than to follow the old system of securing their supplies from individual producers. There are members of the association who feel that their organization is not rendering the service it should because it is not constantly fighting the dealers. These men have not appreciated that this method of procedure has never succeeded and never will. The keen manager gains the confidence and good will of his customers and then renders them the kind of service the business requires. Customers are then willing to pay more for a product, for it is worth more to them. As Mr. Rice has stated, "Confidence in each other creates stability, good will brings the price, and co-operation gives protection to the industry in our individual markets. The three combined promote harmony and the team work that renders efficient service to the industry and betterment of conditions for all."

Progress Through Effort

HOARD'S DAIRYMAN:—Under the leadership of Mr. Doemming, a former tester for the Central Monroe, Wisconsin, Cow Testing Association, there was considerable soil survey work done in this community. Mr. W. E. Hubbard was one of those who took advantage of this survey and he learned how to handle the soil in each field. He is a thorough believer in liming and in hauling manure direct from the barn to the field. Like all good farmers he is building up the fertility of the farm each year. He now expects to be able to feed his cows entirely on alfalfa hay. On a former marsh, now drained, he last year secured better than 3 tons alfalfa hay to the acre.

The cows on the Hubbard Farm have averaged $15.50 per month per cow at the creamery this year. From the first year of testing to the second, the cows gained $30 per head in net

PRIDE OF KING OF THE RILMA'S

She has a two-year-old record of 400.7 lbs. fat in the Hubbard herd of Guernseys at "Green Meadows".

profit, so that each cow by increased profit paid for the cost of testing the entire herd. In three years of testing, the herd average was raised from 6407 lbs. milk containing 306.7 lbs. fat to 6873 lbs. milk containing 349.8 lbs. fat. The following table shows the production of four daughters of King of the Rilma's, compared with the production of their dams:

Dams Age Yrs.	Dams Fat Lbs.	Daughters Age Yrs.	Daughters Fat Lbs.	Credit* Lbs.
5	274.5	2	400.7	573.4
10	373.7	1½	259.9	371.4
5	360.4	2	376.2	537.4
Ave.	336.2		345.6	494.0

*Estimated production of daughters at maturity on the assumption that a two-year-old heifer will produce 70% of what she will at maturity.

The daughters of King of the Rilma's averaged nine pounds more fat at two years old than their dams did at their best mature record. If

KING OF THE RILMA'S

The sire at the head of Mr. Hubbard's herd which has helped build up 3 herds.

allowance be made for age, these heifers may reasonably be expected to produce 160 pounds more fat in a year when they reach maturity than the best records of their dams. This sire is now ten years old, has helped build up three herds, and is still in service.

The Hubbard Farm produces pedigreed seed, Guernsey cattle, Duroc hogs, and sheep. The owner raised 72 lambs this year and finds that a combination of sheep and cattle is very profitable. He specializes in Golden Glow corn and Grimm alfalfa, as he finds these outyield all other crops. He now has all the necessary equipment for efficient production, including a tractor, milking machine, drinking cups, and electricity. This year he is installing a bathroom and a septic tank.

Wisconsin. VERNER SORENSON.

Book on Forage Plants

The growth and utilization of forage crops is one of the most important factors, if not the most important factor, for success in live stock farming. It is the basis of all economic feeding of cattle, for with the right kind of roughages it is possible to build a satisfactory ration with almost any mixture of grains available. Too few farmers recognize the importance of good roughage, just as they fail to appreciate the necessity of better pastures when attempting to feed their cows on pasture for six to eight months of the year.

As a valuable contribution to our specific information concerning this subject, we are pleased to broadcast the news of the publication, by The MacMillan Company, of a revised edition of "Forage Plants and Their Culture", by C. V. Piper of the U. S. Bureau of Plant Industry. The book consists of over 600 pages of printed matter and illustrations descriptive of the great variety of forage plants, their culture and their utilization. Not only is there discussion of each of these plants, but the book contains several chapters that discuss in a general way forage crops as to their growth, preservation, seed, use as hay and pasture, and their relative importance as indicated by a statistical survey of the amount of their production and feeding value.

As indicative of the trend of the first part of this volume, we might briefly itemize the subjects discussed in the chapter devoted to "Meadows and Hayfields". The author describes various meadow mixtures and their composition, the treatment of permanent meadows, fertilizers for hay crops, the principal hay plants, the loss of weight in curing hay, and a great variety of other matter.

The greater part of the volume is devoted to a discussion of the growth and utilization of specific forage crops. We might cite timothy, alfalfa, southern grasses, sorghums, and a host of others. Possibly, however, the readers of Hoard's Dairyman would be most interested in knowing how the author treats the subject of sweet clover which has been so well presented in the series of articles by Professor Fraser. The author describes the plant carefully, its climatic adaptations and soil relations, its history in America, how to seed and secure a stand, its utilization as green manure, hay, pasture, and silage, its yield of hay and seed, and the adaptations of the different varieties.

We do not know of another book better deserving of a place in the farm library where the desire is to have a general discussion of and specific information on the important forage crops of America. This book may be secured from the publisher, or through Hoard's Dairyman Book Department on receipt of its regular price, $3.80.

Says Sam: Hope is the dream of a man awake.

WM. LOUDEN

First to invent water bowl that did not furnish water by gravity system—that prevented spread of contagious disease among cows through water.

Extra Dollars Coming In While You Sleep

You, too, can make more money from your cows this winter, with no additional feed expense, if you'll keep drinking water before them day and night.

Ten per cent gains in milk flow are commonly reported by users whose cows have the benefit of Louden Water Bowls. Figure it out for yourself and see how much more clear money this would mean to you in six months *after allowing for the cost of the Bowls.*

Figure These Savings Also

Add to this extra income the value of the tank heater fuel you save and the time and labor saved through avoiding the disagreeable job of turning the cows out-of-doors to water every day.

From the standpoint of sanitation, Louden Water Bowls, which absolutely prevent the spread of disease from one cow to another through their drinking water, may save you the loss of several high priced cows (it's always the best ones that go wrong) during a single season of close stabling.

Whether you have two cows or two hundred, Louden Water Bowls offer you one of the biggest money-making investments you can make. In fact, Water Bowls alone will soon pay for a full outfit of modern barn equipment, including Stalls, Stanchions, Manure Carrier, etc.

Write today for fully illustrated descriptive matter and all the details about Louden Water Bowls. Just check the coupon and mail it now, while you're thinking of it.

There's no obligation.

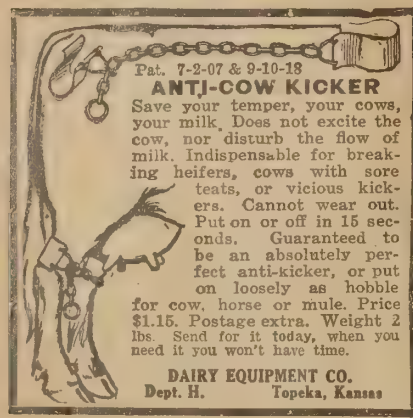
Stop Rust

Every rod of "Galvannealed" Square Deal fence is made of copper-bearing steel. The patented "Galvannealed" process welds 2 to 3 times more zinc coating into the wire. Copper mixed in with the steel together with the extra heavy zinc coating stops rust; therefore Square Deal lasts 2 to 3 times longer. Costs not one cent more than the ordinary kind. We'll send upon request, copy of official tests that absolutely prove these claims.

Galvannealed
Square Deal Fence

has these other good points: Stiff, picket-like stay wires require fewer posts—always tight and trim, no sagging; full gauge wires last longer; famous Square Deal Knot guaranteed not to slip; well crimped line wires give live tension, secure against strains and sudden weather changes.

Two to three times more zinc
—more wear—no extra price



Write today for official proof of tests, also get our catalog—and—a copy of Ropp's Calculator (answers 75,000 farm questions). All 3 free. Address

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Maggots and Screw Worms

Time is so occupied with the important work of the farm and "help" so inadequate that slight scratches, wounds, and abrasions of the skin affecting farm animals often are neglected and consequently become "blown" by flies with the result that maggots form and greatly aggravate the condition or may even cause fatal shock and poisoning. Screw worms, in the southern states, always are a menace to farm stock. So well is the danger understood and feared that on many ranches poison "baits" are set out to attract and destroy the flies responsible for the "worms" or larvae. Wounds of the skin are also sprayed with a fly-repelling disinfectant, when the hands can "get around to it", but despite treatment, or from lack of it when most required, it is quite common for animals to become badly infested and even killed by the parasites. It certainly pays, therefore, to give even the slightest wound of the skin prompt and frequent attention until healing ends the danger from maggots.

Shepherds know so well from experience what havoc maggots may cause in a flock that they are careful to daub pine tar or a mixture of that and crude carbolic acid, or oil of tar, on every shear cut and other wound suffered by sheep and also find it necessary to keep soiled wool clipped from the tail and nearby parts of the body, as flies otherwise would be attracted and maggots result. When such attention was neglected we have seen on a dying sheep a small external orifice or wound and a seething mass of maggots in gangrenous, putrid flesh hidden by wool and skin. Despite immediate removal of the maggots, after injecting chloroform which is deadly to the larvae, and scraping out of the diseased tissues and use of disinfectants, the suffering sheep succumbed. Treatment was given too late. Prevention always is of paramount importance. It is equally necessary as regards cattle. We have seen a diseased udder almost as badly invaded by maggots as the flesh of the sheep we have mentioned. The larvae will form almost "over-night" in hot summer weather. Protection of all wounds on pastured cattle is imperative. Frequent free applications of a reliable commercial fly-repellent will do much to prevent screw worm and maggot invasion of wounds.

We need not give many formulae for "dope" to keep flies away and prevent maggot formation, as they have been published time and again in these columns. Usually the commercial or advertised fly repellents are as cheap as one that could be made on the farm. Where obtainable at fair prices they should be freely used, strictly in accordance with the instructions given by the manufacturer. Nearly every stockman, however, has his own pet preparation and uses it with more or less regularity. For those who have not such a formula we may quote the following which has been much recommended. Cut up and dissolve 1 pound of laundry soap and dissolve it with hot water. Then stir in 1 gallon of kerosene and 3 ounces of powdered naphthalin and add soft water to make 4 gallons. Apply with spray pump. If such a mixture is found to cause too much smarting it should at once be further diluted with water. Care should also be taken not to spray a strong repellent upon the tender udder and teats. For full information about maggots and screw worms see bulletins on the subject which may be obtained from the U. S. Department of Agriculture, Washington, D. C.

Cracked Teats

We have some Holstein cows that we allowed the calves to run with perhaps a little too long and their teats have become cracked and sore and it's some job to do the milking. We have used several different kinds of salves and also healing powder but they do not seem to heal permanently.

Henry, Ill. H. C. S.

For 5 minutes or more, night and morning, immerse the sore teats in hot water containing all the boric acid it will dissolve, then dry the parts gently and apply tincture of iodine once. After that apply a mixture of 1 part of balsam of Peru and 3 parts of glycerin after each immersion, and if that does not suffice try a mixture of 1 part of tincture of iodine and 3 parts of compound tincture of benzoin. As soon as healing is progressing well, stop the immersion treatment and merely apply the balsam mixture or a soft paste of bismuth subnitrate and castor oil.

Scours

My calves are troubled with white diarrhoea. What can I do for it? What causes it? What can I do to prevent its recurrence?

Twinsburgh, Ohio. S. Farms.

You should have told us the age of the calves. If the dysentery occurs just after birth and proves fatal, it is germ caused and the infection is born in the calves or contracted by way of the navel or mouth just after birth. There is no certain medicinal remedy, but the disease can be prevented with a fair degree of success by immunizing the new born calf with anti-dysenteric serum, saturating the stump of the navel with tincture of iodine, then dusting it with powdered starch or finely sifted slaked lime and also disinfecting the cow's teats before the calf is allowed to nurse. Provide a new, sanitary calving pen and similar calf pen. If older calves scour, give a dose of castor oil and follow with a mixture of salol and 2 parts of bismuth subnitrate. The dose is ½ to 1 teaspoonful every 3, 4, or 6 hours, according to size of calf and severity of attack. It may be given in a little water or milk by means of a dose syringe. Sterilize all feeding utensils. Isolate scouring calves. Cleanse, disinfect, and whitewash the calf pen, including the floor and put in fresh bedding.

Friendly Talks for Farm Folks

Sam Dagett admits that he wears 46-inch trousers and a 17 collar, but he is able, nevertheless, to still hang to an unswollen six and seven-eighths hat.

Little Elsie from the city came in one day in tears to her mother, saying, "I've looked all over the woods for grape-nuts to grow but I can't find any at all."

There is a crusade on to save this country's fish, the latter being on the decrease with much rapidity. Then why not begin at once by forcibly lawing all uncreamed codfish off the table?

Masie Randall says that she made crosses after the candidates she had no intention of voting for at the September primaries, just because her mind was on the more important matter of whether to bob or not to bob. Let us hope Masie's mind and hair will be made up by Election Day.

One of the surest cures of high blood pressure is the liberal eating of buttermilk. As probably eight out of ten men and women of middle age have this disease in more or less dangerous form, what a blessing it would be to consumer and milk producer if the two could only get together more copiously on the buttermilk diet.

Lettie Barber is in love with a young man, but her mother won't let Lettie marry him because she's only known him for six weeks. On the other hand, Nellie Russel is in love with one of the neighbor's sons, and her mother won't give her consent because Nellie has known this suitor for six years and so knows him far too well. It's getting these days so that a girl can't safely get married at all.

Dan Beardsly from the Hollow and Ike Barrows from the Corners are always bickering back and forth over the respective merits of their two farming sections. Dan pretends to believe that crops grown down the Corners way aren't worth harvesting, while Ike pokes all manner of fun at the produce which Dan raises up in the Hollow. The other day Dan had an errand in Ike's part of the country, and seeing the latter cutting cabbages along the side of the road, called out, "Hey, there, neighbor, are those the largest potatoes you can grow on this farm?" "Quit your kidding," yelled back Ike with gusto, "these aren't potatoes I'm cutting; they're my fourth crop of this season's peas."

Cousin Lena Cox says that no one has read and reread the etiquette book more thoroughly than she, and until the other day she really flattered herself that she was prepared for any social emergency which might come up. But as luck would have it, when little Willie Cox accompanied her to the church supper and upset a full glass of milk all over the church's one big tablecloth, necessitating its prompt removal from service, and the church only had this one tablecloth, and all the Ladies' Aid Society looked—and some went so far as to say—unspeakable things, well, Cousin Lena simply didn't know what to do or how to turn the thing off. And she paid $4 for the disgusting book into the bargain. Another case of a supposed friend deserting one at the vital moment.

New York. HELEN S. K. WILLCOX.

New York Experiment Station Jerseys

(Continued from page 436)

used for comparison with the subsequent lactation period. A cow was considered as being milked and fed thrice daily for the entire lactation period if she was so milked and fed within 90 days after the beginning of her lactation period:

Table 3—Yearly Fat Records of Cows Milked Thrice Daily

Cow No.	Record prior to Nov. 1, 1922 No. of lactation	Av. yearly fat record	Age of cow on Nov. 1 1922	Yr. record preceding Nov. 1 1922	Yr. record on three milkings
3	1	336.7	3	336.7	535.1
4	4	370.0	6	428.4	550.8
5	8	386.7	11	420.7	392.8
23	10	413.5	13	386.9	558.1
24	4	344.7	6	325.7	489.5
26	2	301.2	4	414.6	435.0
Av. of 6 cows		358.8		385.4	493.3
Increase over preceding year					107.9

Table 4—Yearly Fat Records of Cows Milked Twice Daily

Cow No.	Record prior to Nov. 1, 1922 No. of lactation	Av. yearly fat record	Age of cow on Nov. 1 1922	Yr. record preceding Nov. 1 1922	Yr. record on two milkings
1	3	320.7	5	309.4	340.9
2	3	283.7	5	329.2	451.1
7	6	314.1	8	298.8	316.7
12	1	347.5	3	347.5	407.5
16	11	403.4	14	378.5	371.4
18	9	372.2	11	432.8	496.4
20	4	288.6	6	291.2	376.1
Av. of 7 cows		332.9		340.9	394.3
Increase over preceding year					53.4

It will be noted that the cows milked thrice daily increased 107.9 lbs. fat and those milked twice daily increased also but not to so great an extent. The cows milked thrice daily were milked for 12 months and those milked twice daily were milked 11 periods. The dry periods for that year were nearly identical in length. The advantage of 54.5 lbs. of fat per year which the three time per day milking has over twice a day must therefore be reduced by the twelfth month yield if the results are to be more nearly comparable. The average twelfth month production was 32.2 lbs. butterfat per cow which when subtracted from the total increase leaves a net increase due to three milkings and feedings of 22.3 lbs. of butterfat per year.

Such a small increased production due to three feedings and milkings hardly paid for the additional feed so that the extra labor was a complete loss. Discouraging as was the first year's results may seem to the farmer producing milk or butterfat for profit, there are numerous other factors involved. Consider for a moment selected individuals. Experiment Fairy Queen produced 336.7 lbs. of butterfat during her first lactation period on two milkings. She was milked thrice daily for the next lactation period and produced as a senior two-year-old 535.1 lbs. butterfat. Numerous heifers in the herd have produced more than 336 lbs. of butterfat during their first lactation but no cow at this Station has ever equaled her second record at 2 years of age. Will three milkings per day develop her into the highest producing cow the Station has ever owned? Consider also the performance of Rufus Oxford Carey BB who was an average producer for the first four lactation periods. Her average record of 344.7 lbs. of fat increased with three milkings at six years of age to 489.5 lbs. and during the first month of her second lactation period on three milkings she gave just double the butterfat produced in the first month of her last lactation period on two milkings per day when she was five years of age. Will three feedings and milkings serve as a method of developing and discovering the best females in the herd so that they might be used for breeding and record making purposes?

The immediate effect of three milkings and feedings per day is not of much importance to dairymen. It is the long time cumulative effect of this treatment that is so vital to profitable milk and butterfat production as well as to the development of high producing strains of cattle for the advancement of the breed. At some future time the record of the Jersey herd of the New York Agricultural Experiment Station should give valuable information upon this question.

(EDITOR'S NOTE: This is the fourth and concluding article by Mr. Dahlberg on lessons from the herd experience of the Geneva Station for the past quarter of a century.)

AURELIA, OWNED BY WM. KNOBLOCK OF MICHIGAN

The grade Jersey was 8 years old and in one year she produced 13,718 lbs. milk and 715.3 lbs. fat in addition to a fine calf. This gave her third place among all cow test cows in Michigan. Her feed cost was $151.34 and the return above feed cost was $246.48. Good cows liberally fed will make the dairyman a good profit.

Knoblock's herd of 17 Jerseys led the Allegan County cow testing associations and stood third in Michigan with an average production of 8,997.8 lbs. milk and 479.9 lbs. fat per cow. Average feed cost was $113.56—return above feed cost was $154.22 per cow. You can't get something for nothing and if you want your good cows to make you money, give them a chance through liberal feeding.

Born Aug. 10, 1923

Edgerstoune's Luxury Bond

A Promising Young Bull For Sale

His sire, Sandhill Premium Bond Imp., was a first prize winner in Scotland as well as a National Dairy Show winner in this country. His dam, Nether Craig Luxury, 2nd at the 1923 National Dairy Show, has a record of 13,742 lbs. milk 594.36 lbs. fat. This youngster is a promising prospect as a show bull and as a herd sire. Write today for price and pedigree.

EDGERSTOUNE FARM, Geo. A. Hill, Mgr., Princeton, N. J.

Say it With Dollars

(Continued from page 435)

today that the money is mighty well invested.

Five home-made flues leading up to a 4-foot square cupola furnish ample ventilation for his reconstructed barn. This barn has stanchion room for 22 cows, two box stalls, and three grain bins. He is such a strong believer in ventilation that he even has a specific ventilating system in his home, built much on the plan as found in his barn.

In addition to his outstanding success financially he has attained another success that many another farmer has had as his dream but has failed. For the last few years, the Chester farm has been under the management of F. A. Chester and Sons. The sons, Ralph A., Nathan A., and Elmer A., were taken in as partners as they became of age. No problem of keeping the boys on the farm on the Chester plan. When Ralph A. became of age, he received one-fifth of the profit and so on until the three sons have three-fifths and F. A. Chester has two-fifths of the net profit.

Certified Milk Farms

At the present time there are 152 farms in the United States producing certified milk under rules and regulations prescribed by 79 different medical milk commissions. New York leads with 32 farms producing certified milk, followed by Pennsylvania with 15 and California with 13.

Churches Co-operate in Promoting Health

(Continued from page 433)

figure into a statement apropos of our present "milk for health" campaign" and say "good health is the art of selecting good food and indulging in proper exercise."

Fourth—The House. A strange name for a disease, I admit, but it is the disease peculiar to civilization. When we took the Indians out of tents and housed them we killed them off faster than by bullets. I am arguing the value of fresh air. I am constrained to believe that the automobile is bankrupting us financially and corrupting us morally, but we must doff our hats to it when it comes to the matter of ozone. It has snatched semi-invalids from wheel chairs, served as a fountain of youth to the aged, carried the town back to the country where it ought to be, and rendered incalculable service in the matter of giving air to the closely confined. How well do we remember the windowless, dark closeted houses. Every means available, apparently, for keeping fresh air and light out of the house was employed. When pneumonia developed, the windows and doors were closed, even the cracks were stuffed and "air" was regarded as a vicious enemy. We have improved, yes, wonderfully, yet how many today are victims of the house?

These are but four of many kindred unusual diseases that afflict us. Permit me to suggest four wonderful medicines which are so palatable that, like Castoria, "the children cry for it". They are so obvious, however, and are so simple that the most of us are oblivious to their virtues.

Let me prescribe air, sunlight, water, and diet as really wonderful medicines. I have already set forth some of the virtues of fresh air. Dr. Crane says: "It is hard to overvalue fresh air. Its effects are far-reaching, ramifying in sanity and vigor to the most unsuspected cells of human activity."

We should realize that the comfort and efficiency of our days depend fundamentally upon the condition of this physical machine in which we are housed. What a source of enthusiasm is this body of ours! Strange wires run from it up to the spirit. It is our reservoir of vigor, the basis of clear thought, the fountain of inspiration, the tap-root of contentment. Let us make the following resolution: "I will not wrong it by excess, nor enfeeble it with idleness, but will treat it well since from it I expect so much."

As for "sunlight", interview the specialists in tubercular troubles. Visit tubercular sanatoriums and hear the patients talk of sunbaths and diet. What would our poor old earth do without "Dr. Sun"? Not only does he effect an annual resurrection, but some time soon our winter fuel will be "stored-up-sun".

Water! Diet! These two, and the greatest of these is ——? An eminent physician said recently, "Note the four X's"—Examination, Excretion, Exercise, and Excess.

I recall that pathetic wail from "The Ancient Mariner"—"Water, water everywhere, and not a drop to drink," yet more pathetic this,—"Water, water everywhere, and no one drinks enough."

Diet. I have observed some "on a diet" who must have spelled it "Die-eat". For ere long they would exclaim, "I'll eat it if it kills me," or "I'll die if I don't get something to eat." A funny platitude this—"It isn't what you eat that does you good, it's what you digest." I wonder after all if it isn't what we eat that does us good, and that, if we eat proper foods, we will have less trouble with our digestion. Did you ever hear this—"An apple a day, keeps the doctor away"? And this, "If you'll try drinking milk you'll feel fine as silk"? With apologies to Mr. Post, "there's a reason".

When writing advertisers please mention Hoard's Dairyman.

BARGAINS FOR DAIRYMEN !

Pure Bred and Grade Holsteins !!

TO BE SOLD IN THE

Crozer Dairy Farm DISPERSAL

THURSDAY and FRIDAY **October 30-31** At the FARM

UPLAND, PENNA.

110 Purebred Holsteins **50 Heavy Milking Grades**

The six pure bred bulls to be sold include our own three herd sires and a son of each from a large record dam.

The pure bred cows have good records. Many of them have seven day official records up to 32 lbs. butter and up to over 800 lbs. milk. A large proportion of them have good, long time records made under ordinary dairy conditions without forcing. The grades are real producers, milking from sixty to seventy pounds daily when fresh. Many of the grades are by famous sires with a lot of production back of them.

LOCATION—Upland adjoins Chester, which is fifteen miles from the heart of Philadelphia. Chester is on the Washington Branch of both the Pennsylvania and the B. & O. Trolleys from Chester to Upland leave both stations and will be met by automobiles at Sixth St. in Upland both mornings.

JUST A NICE DRIVE BY AUTOMOBILE FROM PHILADELPHIA

SALE STARTS 10:30 SHARP BOTH DAYS. Some of the good ones will start the sale. BE ON TIME

CRANE AUTOMATIC WATER SYSTEMS

CRANE AUTOMATIC WATER SYSTEMS CAN BE HAD IN CAPACITIES RANGING FROM 200 GALLONS UP TO 6000 GALLONS PER HOUR

FOR THE HOUSE, TWO TYPES FOR THE ORDINARY AND DEEP WELL ELECTRIC OR GASOLINE POWER. A THIRD TYPE FOR LARGE USERS

The convenience and comfort of fresh running water costs less to have than to do without

An increasing number of farmers, thousands of them the country over, are finding that fresh running water, under pressure, actually *saves them money*, to say nothing of the finer comfort and health it provides in the home and throughout the farm.

Farmers in windy districts report that the saving in windmill repairs alone pays for a Crane System. Where the wind is low, they spend their time improving their crops instead of laboriously pumping water by hand.

Healthier, cleaner cows pay better

With plenty of fresh, cool water, cows make new production records and all kinds of stock thrive, yielding greater profits. Water, under pressure, *never gets stale*. The barn and milk house, the separator and cans are cleaned better in less time with a flood of fresh running water always on tap.

As dependable as city water supply

At the turn of a faucet fresh running water pours out for bathing and for washday. This comfort and pleasure are more than worth the few cents a day that pays for the gasoline or electric current consumed.

Crane systems pump from 200 to 6,000 gallons an hour from an open well, from cistern, spring or lake. Entirely automatic where electricity is available or driven by a smooth running, quiet gasoline engine. In every type and capacity Crane systems deliver lasting satisfaction at lowest cost.

You are now paying for the convenience of fresh running water whether you have it or not. Why do without a modern water system longer?

Get the facts now—no obligation

Look up the plumbing contractor or dealer in your town who handles Crane plumbing materials. He will help you select the right system and fittings for your needs. Mail the coupon now for new water system booklet, H. D-1.

CRANE

GENERAL OFFICES: CRANE BUILDING, 836 SOUTH MICHIGAN AVENUE, CHICAGO

Wherever you live, there is a plumbing contractor or hardware dealer near you who handles Crane products. He has the Crane water system that fits your needs or he can immediately secure it from the nearest of 87 Crane branches and offices in the United States. Should you have any difficulty in securing the right water system, write to us.

KEEPING UP FERTILITY ON DAIRY FARMS

A. W. BLAIR, NEW JERSEY

THE story of soil depletion is not a new one. Every farmer who has made a success of his business is fully conscious of the fierce struggle that was required to keep his yields from declining. Indeed in many cases they have declined in spite of this fierce struggle. If anyone doubts this statement let him go to the bankers and executive officers of insurance companies for its confirmation. Recently an officer of a prominent insurance company was asked why his company was no longer interested in farm mortgages in his state. The official's reply was: "Because the farmers have used up the fertility of the soil." If one uses up his principal, how can he expect to have any income?

More than 40 years ago the noted English scientist, Sir John B. Lawes, foresaw, in some measure, how America drew upon her natural fertility. He pointed out that the British farmer need not so much fear competition from American wheat grown by purchased fertility, as competition from wheat grown on the vast stores of natural fertility, which, he said, was much cheaper than any derived from artificial or imported sources.

But Sir John could not have fully realized how short would be the time, comparatively speaking, that would be required to exhaust this fertility. The very cheapness of this natural fertility of which he spoke, lead this nation into wasteful and extravagant methods of farming undreamed of by the older European countries. As a consequence there are no longer vast areas of unused fertile lands. The borders have been touched and the farmer must retrace his steps and put new life into the wasted lands. His declining yields and greater need for manures and fertilizers have told him, in no uncertain terms, of the changes that have been taking place. And his findings have been checked up and verified by scientific tests. For thirty or forty years some of the leading experiment stations of the country have kept a soil inventory—a careful record of the income and outgo of soil nitrogen under normal cropping conditions—and have found that there is a loss of nitrogen, even under conditions which are better than the average. With these facts in mind a large number of the farmers of this country are today honestly seeking for better methods of soil improvement.

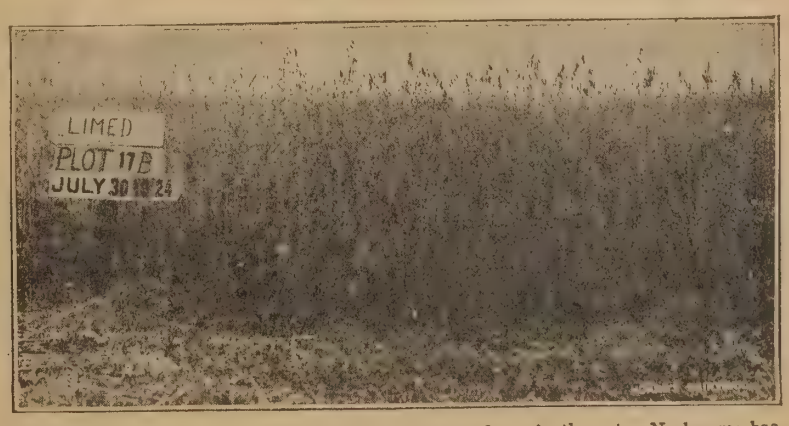
FILLING THE SILO ON A COMMERCIAL DAIRY FARM IN NEW JERSEY

The problem for the dairy farmer is not so difficult as it is for the grain, tobacco, cotton, or truck farmer. All of these are selling crops which take much from the land and leave little to be put back, whereas the manure which the dairy farmer produces, if properly handled, will go a long way toward replacing the fertility taken out by the crops which he grows.

Good manure, properly handled, is the most wonderful fertilizer there is; it is for the growing crop what milk is to the growing calf or child—a perfect food.

A gentleman who has made a success in the nursery business, and whose people have been nurserymen for more than 150 years, was recently showing the writer his herd of beautiful Guernseys, and large barn filled with hay. In a manner that gave the impression of an apology, he explained that they put the dairy in "to help keep up the fertility of the soil".

Thus in addition to producing milk, the dairy becomes a fertilizer factory, taking raw materials such as hay, straw, cornstalks, silage, concentrates, etc., and turning out available plant food.



But even the dairy farmer must not depend on manure alone. The demand for nitrogen especially is great and since some loss is inevitable, not enough can be put back into the soil in this way. Full advantage should therefore be taken of the method of extracting nitrogen from the air by growing legume crops, both as green manures and as main crops. But such crops do not, like Topsy, "just grow". They, too, must have some attention. Alfalfa and clover especially and to a lesser degree nearly all of the legumes make heavy demands on the soil's supply of lime, phosphoric acid, and potash. If attention is not given to renewing the supply, the crops will ultimately fail. This has been abundantly demonstrated on some of the fertility plots at the New Jersey Experiment Station. Certain plots which have received no manure or commercial nitrogen for the last 17 years or more, but which have received liberal supplies of lime, acid phosphate, and muriate of potash, persist in growing a fair crop of clover even where none was seeded. It comes as a volunteer crop in the grain and following timothy (not timothy and clover). Attention is called to this to show how important it is to first make the conditions favorable for the growing of such crops. They can then be grown without trouble and become a most important factor in soil improvement. Thanks to the volunteer clover, in the case just cited, the plots yielded over 50 bushels of shelled corn to the acre in 1923. The plot without lime and minerals, and therefore without clover, is now typical "worn-out" land.

On another piece of land, soy beans were grown continuously for 10 years without a pound of manure or commercial nitrogen, but lime and mineral fertilizers (phosphate and potash) were used in liberal amounts. The yield of beans was maintained at a good level during this time, and in 1923, still without applied nitrogen, the land yielded about 54 bushels of corn to the acre. An adjoining piece of land treated in the same way with the exception of the lime treatment, practically ceased to produce beans at

(Continued on page 488)

CORN—POTATOES—ALFALFA, A GOOD ROTATION FOR A DAIRY FARM

The dark effect in the picture is due to volunteer clover in the oats. No legume has been seeded on this land for more than 16 years, but generous use has been made of lime, phosphate, and potash.

Nutrition Dairy Barn Completed

S. R. WINTERS, Washington, D. C.

THE largest dairy barn owned by the federal government has been completed for the Dairy Bureau of the United States Department of Agriculture on its experiment farm at Beltsville, Maryland. Costing approximately $20,000, this structure, designed by W. D. Chandler, architect of the Bureau of Animal Industry, and K. E. Parks, dairy engineer, is 36 by 118 feet in dimensions. It is two stories in height and is built of a combination of tile and concrete, with a gable roof.

The newly completed building will serve the two-fold purpose of containing an experimental laboratory and accommodating a herd of dairy cows. As a matter of fact, this structure was designed and erected largely in response to the needs for an animal nutrition laboratory. The significance of the experiments of Dr. E. B. Meigs of the Dairy Bureau, which have indicated that dairy cows demand calcium and phosphorus in addition to a regular ration, emphasized the necessity for a combination nutrition laboratory and dairy barn. Here, literally, certain cows will be separated from the common herd in the interest of obtaining knowledge pertaining to the feeding of these minerals in extra allowances as a measure of increasing the production of milk and butterfat.

Under the previously existing arrangements at the Beltsville Dairy Bureau experiment farm, the cows being subjected to feeding tests including additional amounts of calcium and phosphorus could not be disassociated from other members of the government dairy herd, which made difficult the control of these important experiments. For instance, after making analysis of the feeds used in such tests it was not advisable to allow the members of the common herd to partake of such selected rations and yet the division could not always be effected. A lack of space made it necessary to have the various cows of the herd mingle together.

INTERIOR OF NUTRITION BARN, BELTSVILLE, MD.

THE $20,000 DAIRY OR NUTRITION BARN RECENTLY COMPLETED AT BELTSVILLE, MD.

The new building can accommodate thirty-two dairy animals and there are three rooms reserved for a laboratory, with a basement in addition. The floor over the cows is built of fireproof materials, consisting of a combination of tile and concrete. This is a very desirable feature, since in the event of an outbreak of fire it is possible to remove the animals from the barn before they succumb to the flames. This $20,000 dairy barn has been equipped with special grain blending and handling equipment. This provision will enable dairy husbandmen and nutrition experts to obtain feeds of uniform content and quality. This will further facilitate the analyzing and measuring of the proteins and other constituents in exact proportions.

Fitting, is it not, that this pretentious nutrition laboratory and dairy barn should be completed and dedicated simultaneously with the passage of congressional legislation elevating the Dairy Division from an integral part of the Bureau of Animal Industry to a full fledged bureau of the United States Department of Agriculture? A "barn warming" at Beltsville, Maryland, on June 7, participated in by workers of the Dairy Bureau, commemorated the completion of the largest dairy barn built on any of the government experimental projects. This same "barn warming" radiated jubilance over the signature of the President to a bill which gives recognition to the term "Dairy Bureau".

A High Point at the National Dairy Exposition

WILBER J. FRASER, University of Illinois

THE National Dairy Show that has just closed at Milwaukee, Wisconsin, is becoming more and more a great power for education along dairy lines. When it started 18 years ago it consisted of the showing of pure-bred dairy cattle and a comparatively small amount of dairy machinery. Since that time these departments have not only grown tremendously, but there have been added many educational features of a high order.

The one exhibit of the whole National Dairy Show that appealed to me the strongest in bringing out the great fundamentals of success in economic milk production consisted of 200 grade cows in one barn. These cows were from Wisconsin Cow Testing Associations and came from various parts of the state. In order to be eligible to this show each mature cow must have produced at least 350 pounds butterfat in one year. Cows under four years of age must have produced at least 250 pounds fat. This group of cows consisted of grade Holsteins, Guernseys, and Jerseys—fine specimens were these honest, broad, deep cows brought right from their homes just as they were, doing their best day by day in their great life work in producing economical human food of the finest quality. These cows might *well* be called "the foster mothers of the race" for every one had proved her ability in high economical production.

Upon reaching the show grounds, I went first to this barn, and during the four days spent at the Dairy Show, I found myself going back again and again to this splendid collection of grade cows, looking over the individuals, studying their records, and pondering what it all meant—the solution of successful dairying in the future—the economical production of milk. Only as dairying is based upon economic principles of good individual cows and their economical feeding, can it permanently endure.

The Most Expensive Animal

As one approached this cow testing association barn, his attention was attracted by a wire pen on which was a label reading, "The Most Expensive Animal on the Farm", and in the pen was the smallest, runtiest, speckled scrub bull I have ever seen. This bull was in striking contrast to the fine pure-breds that must have sired the excellent grade cows inside the barn.

As one entered the barn, on the left was the headquarters of the cow testing association exhibit with some important and striking cartoons and sayings on the wall as follows: "Are You Milking Cows for Exercise or Profit?"; a cartoon showing a poor, tired dairyman chained to a poor cow, being dragged around wherever she chose to lead him; a clock on the wall had the hands removed, with the following below it—"Running a Farm Without Records is Like Running a Clock Without Hands".

On the same side of the building farther on was a home-grown feed exhibit put up by the University of Wisconsin, showing the importance and economy of feeding cows on home-grown feeds.

On the right one was met with a string of cows, each individual representing the following:

1. The average cow of the United States which produces 160 pounds of fat.
2. The average cow of Wisconsin which produces 190 pounds of fat.
3. The average cow in all Wisconsin cow testing associations which produced 273 pounds of fat.
4. The average cow in the highest Wisconsin cow testing association which produced 341 pounds of fat.
5. The highest herd average in a Wisconsin cow testing association which was 534 pounds of fat. This herd consisted of 13 cows.

These records illustrate in a most striking manner how the production of cows can be increased by better breeding, feeding, and care. The average of all cows in the Wisconsin cow testing associations being 113 pounds above the average of the cows in the United States, while the production of the cows in the highest cow testing association is more than twice that of the average cow of the United States.

Daughters and Granddaughters of a Good Sire

Another striking exhibit in this barn was that of nine grade Holstein cows from the herd of Rockwell and Katterhenry of Rock County, Wisconsin. The nine cows were all by the same sire, Mercedes Ladd Johanna Son. The best one of these cows produced in one year 23,374 pounds milk and 804 pounds fat, and these nine cows averaged 14,365 pounds milk and 496 pounds fat. These were all fine, large, deep, beautiful cows showing in a marked way what can be done by proper breeding, as this herd had been graded up from common or scrub cows only four generations before. Another significant thing brought out by this exhibit was that the sire of these excellent cows had been sold for beef and killed before it was known what fine producing daughters he was siring—a tragedy that too often occurs. The oldest of these nine cows was eight years, and the youngest was six years.

Next to these cows were exhibited nine of their daughters sired by Ormsby Pontiac Maplecrest. Only six of these had finished a year's record, and these six produced an average of 8,742 pounds milk and 306 pounds fat. These were fine, large heifers of excellent quality, and showed that the high production of this herd would be continued.

This herd was run on pasture during the summer and fed during the winter 30 pounds of corn silage, 10 to 15 pounds of alfalfa hay, and a mixture of farm-grown grains both winter and summer.

There were six rows of cows in the barn. To the right of the Holsteins came the grade Guernseys, and beyond those were the Jerseys.

Nine of the grade Guernseys exhibited produced an average of 467 pounds of fat in one year; 20 grades of all ages produced an average of

(Continued on page 490)

BUILDING SUCCESS ON QUALITY

FRANK BUNCE, WISCONSIN

THREE years ago when John Ramsay settled upon a dairy farm which during twenty-five preceding years of tenant farming had never proven over-profitable to its managers and proceeded to invest more than $2,000 in constructing a sanitary and modern milk house and in machinery designed to increase the purity and cleanliness of his milk, neighbors shook their heads and uttered ominous predictions of disaster.

Fancy dairying, they declared, wouldn't pay in Northeastern Wisconsin. People, they argued, wanted cheap milk and the man who was in a position to sell milk pure enough and rich enough to meet the requirements of the statutes laid down by the city and state, and at the same time undersell his competitors, would secure the most patronage.

In a scant three years John Ramsay has proven the fallacy of that argument. Today he charges 50 per cent more for his milk than any of his competitors; and, it is significant, he is selling all the milk he can produce.

The explanation, Mr. Ramsay points out, is that people are willing to pay more for a superior product.

"My customers are not all from the richer classes," he declares. "People of moderate means are willing to pay more for pure milk to safeguard the health of themselves and their children."

The career of Mr. Ramsay has not been unattended by difficulties. Some whom he approached as prospective customers expressed their frank opinion that he was demanding too much money for his product. Others were unable to appreciate the superior merit of his product. Others declared that they had "been using pasteurized milk for years" and that "the old way" was good enough for them. For six months Mr. Ramsay's efforts were directed mainly toward public education, through advertising and personal letters; and for the first few weeks he made daily trips to the city with three bottles of milk in his truck.

Slowly his milk route was enlarged. People receiving his personal sales letters and circulars, which he was careful to make brief, interesting, and to the point, began to take interest in his project. Customers told neighbors and friends of the excellence of his product. Over their tea tables women discussed his venture; at meetings of women's clubs his sanitary measures were discussed. At the end of the first year he was serving fifty customers; at the end of the second more than a hundred, and his daily sales have increased ever since.

The fame of the Ramsay farm spread rapidly. Visitors from the Twin Cities of Marinette and Menominee began to stream out to the Ramsay farm. Agricultural authorities from rural districts, towns, and cities in a radius of 100 miles attracted by reports of the unique sanitation methods being employed, often travelled long distances to inspect the Ramsay barns and herds; and tourists often turned off the main highway to talk for a few minutes with this young farmer with an ideal.

"I wish that every one of my customers and prospective customers could visit my farm," Mr. Ramsay said: "I never had a man come to this farm with an open and unprejudiced mind who hasn't been sold on my methods."

It is true that to appreciate the superior quality of the Ramsay farm milk, one must first visit the farm and trace the milk from the udder of the cow to the doorstep of the purchaser. The visitor notes two things of paramount interest to exponents of sanitation and germ control: first, that not a human hand touches the milk from the time it flows into the pail until it is measured out into bottles; second, that the milk undergoes no less than eight distinct processes designed to free it from dirt and harmful bacteria.

At milking time the cows are driven into cool, airy barns, washed and brushed scrupulously clean. Milk is drawn into covered and screened pails, emptied into sanitary containers, cooled, purified, capped, and bottled automatically. During the entire process not a reasonable chance has been given dirt or bacteria to get into the milk, for bottles, cooler, and bottling machines are washed twice daily.

JOHN RAMSAY

There is no secret about Mr. Ramsay's success. To begin with, he laid the foundation for his experiment by accumulating a broad fund of general and specialized knowledge of the dairy industry. Following his graduation from the agricultural department of the University of Wisconsin, he visited many of the largest dairy farms in Wisconsin to familiarize himself with the practical side of dairying. To become better acquainted with technical advanced dairying he assembled and digested a veritable library of up-to-date volumes and current agricultural periodicals. With a rare knowledge of his chosen profession he combines the will to work and the ability to co-ordinate the work of head and hands that spells success.

To those who would follow his lead, Mr. Ramsay gives this terse advice: "Believe in yourself and your work. Set a fair price and hold fast to it without regard for competitors. Put your hand to the plow and work like blazes with your eye on the goal."

THE BARNS AND MILK HOUSE ON THE RAMSAY FARM

What Cow Testing Will Do for the Dairy Farmer

HERMAN GRABOW, CALIFORNIA

WE shall attempt to give a clear and concise article on the cow testing association. First, we need a cow tester—for that is wherein the biggest differences lie—and a good one for he is the cornerstone in the foundation of a successful association. He either makes or breaks it. As he is responsible for all the records, test, etc., and the officers merely transact routine business once or twice a year, it can be seen that upon him alone rests all responsibility of the success or failure. Especially is this true for a new association. A good tester is indispensable for any association that wants to accomplish things.

We have agricultural colleges, dairy papers, short courses, etc., and great as these are we know that there are thousands of average dairymen who receive no help from any of these. In Minnesota, for instance, the average dairymen raise more timothy than alfalfa (in fact some do not believe in alfalfa); the average cow is a scrub or a grade cow; oat straw and corn stalks constitute a part of the roughage; cows freshen any time; pasture is shortlived, little grain is fed; cows are not fitted before freshening, and consequently the average cow produces only 160 lbs. of fat which is not profitable. The problem is simple. We have an average dairyman and we know that certain practices will turn average dairying from an unprofitable enterprise to a profitable one. How shall it be done? Will bulletins, short courses, fairs, lectures, and dairy magazines do it? No, three times no. Bulletins have many good things in them but they lack one thing that is of vital importance to a dairy enterprise and that is the human one. For the tester is always on the job noting just what is needed at one farm and what at another. We are all familiar with the saying that a chain is as strong as its weakest link—how does that apply to dairying?

Chemists know that to produce certain results every ingredient must be present in the correct proportions. In other words, that which is missing is the limiting factor whether it be totally or partially absent. Now in building up a profitable dairy herd the thing to guard against is these limiting factors. A dairyman may have the best of cows, of feed, and yet be doing some one thing that limits his success. He cannot see it because it is right before his eyes—whereas a tester, visiting many other dairymen, is constantly looking out for possible defect, and sees them at once. Such a service is easily given by the tester and is invaluable to the dairymen. There would be no other practical way for the dairyman to receive this information.

In Parkers Prairie last year we had a good demonstration of the feeding question. Queen, a grade cow, owned by W. Wilke, freshened in November, 1922. When tested in December she milked 24.5 lbs. per day. Her feed was insufficient and it was increased according to the regular standard rules. In January she produced 27.7 lbs. per day. Again her feed was increased. In February she gave 31 lbs. Again her feed was increased and in March, four months after freshening, she produced 32 lbs. of milk per day or an increase of 33%. Such an increase on a cow and in a herd owned by a dairyman known in the community does more to convince skeptics of the value of feeding better than a thousand bulletins.

Gets the Dairymen to Co-operate

In order to form an association for testing cows the various dairymen in the community must co-operate. They all sign up binding themselves to test for one year and it is an easy matter to work together in other ways. One of these is co-operative buying of feeds. Up to last year the dairymen of Parkers Prairie had never bought a car load of feed co-operatively. Due to testing, a twenty-five ton car of oil meal was shipped in at a substantial saving to the dairymen.

The outstanding achievement of the cow testing association at Parkers Prairie, during its first year, was a community appreciation of dairying; of the profit difference between a 100-lb. cow and a 350-lb. cow, and a spirit of co-operation. When we have a community, from the banker to the hired man, honestly interested in any association it has a wonderful opportunity for success. The local newspaper each week printed news items concerning the association and each month published the reports on the cows. Also an article prepared by the tester on feeding of the cows was printed and when the first year was up the tester in a very short time solicited these community men in town and obtained sufficient funds to publish 1,000 copies of a report on the year's work of thirty-two pages.

In the spring of 1923 the county agent put on an alfalfa campaign. The testing association was back of it. The community was too. The banks paid for six hundred copies of an Alfalfa Special which was distributed to the farmers. As a result, at least one thousand new plots of alfalfa were started as an experiment. A few months later, when clover and timothy were knee high to a grasshopper and the alfalfa going strong, more than one dairyman remarked: "Guess I will put in ten acres next year." To put anything across you must have the community spirit, and it certainly was in evidence at Parkers Prairie.

I say that testing dairy cows is one of the absolutely essential things in the advancement of any breed or any herd. It is the yard stick that measures the degree of success achieved in the up building of production, and that is what the dairyman must have.

Gasoline Engine Troubles and Remedies

R. U. BLASINGAME, PENNSYLVANIA

ALTHOUGH the fuel tank may be full, yet the engine may not go. Some of the common fuel system troubles are discussed below and illustrations shown so that one may grasp the ideas easily and quickly. Remedies are important although not always in the province of the layman to correct. Don't forget that the instruction book can be read with profit.

1. The Carburetor. By opening the drain cock under the carburetor one can tell whether the carburetor is getting gas or not. If fuel flows out freely, the fuel system is in good shape. It is a good idea to drain the carburetor once in a while. This gets rid of water and other foreign matter which may collect in the bowl of the carburetor. If fuel does not flow out of the drain cock under the carburetor, run a wire through it. It may be stopped up. Fig. 1 shows the carburetor pet cock opened.

2. Fuel Screen. Fig. 2 shows one of the screens in the fuel line. If this screen should become covered with trash it will prevent the gas from flowing. The screen can be removed and washed off. The screen is placed in the line to prevent trash entering the carburetor. The "instruction book" ought to show the location of the screen or screens, if more than one, and give information for removing them.

3. Fuel Supply Pipe. By disconnecting the gasoline supply tank from the top of the vacuum tank to the tank on the rear of the car and blowing through it with the tire pump will clean it out in good shape. When replacing the supply pipe be sure that the screw connections are tight. It is a good idea to put soap or shellac on the screw threads to insure a tight joint. Fig. 3 shows the use of the tire pump to clean out the gasoline pipe.

4. A Vacuum Tank. If the engine stops or does not start, and the drain at the bottom of vacuum tank shows no gas, remove the plug from the top of the tank and fill with fuel, as shown in Fig. 4. If the engine runs until this supply is exhausted then stops, something may be wrong with vacuum tank.

If a small amount of gas escapes from the vent pipe on top of the vacuum tank, once in a while, no harm will be done and no adjustment is needed.. However, if the vent overflows regularly the air hole in the gas tank filler cap may be stopped with mud from the road or grease from the hands.

If fuel leaks from the vacuum tank proper, the cause may be from:

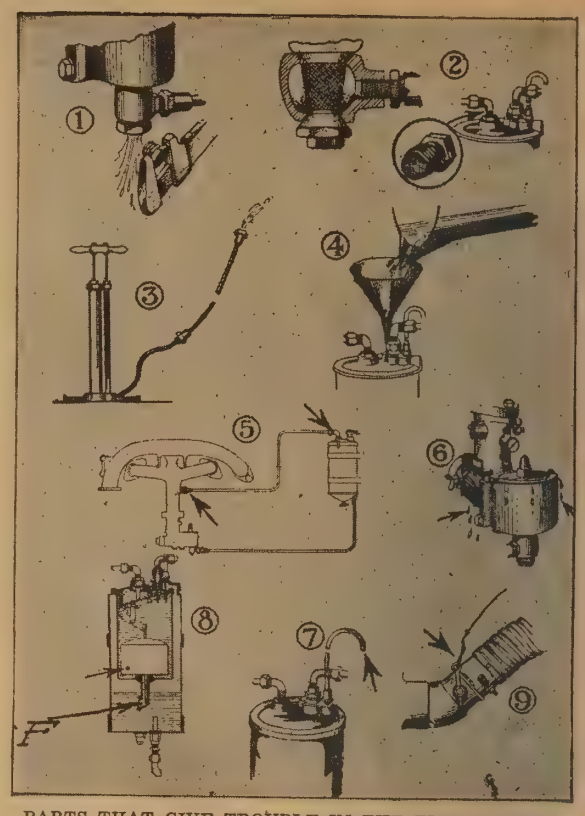
a. The connection to the carburetor from the bottom of the vacuum tank may be loose. Put soap or shellac on the threads and draw up the nut.

b. There may be a leak in the tubing. Solder will stop this. The tubing may split or a hole may rub through.

c. A leak may occur in the outer wall of the tank. Solder it shut.

5. Suction pipe loose. The two arrows at Fig. 5 show the connection of the section pipe from the carburetor intake manifold to the top of the vacuum tank. If the upper connection, on the carburetor intake, is loose the suction or pumping action of the pistons will not draw the gasoline from the rear tank. This is also true of the connection at the top of the vacuum tank. Put some soap or shellac on the threads and pull them up tight. In case the threads are worn or stripped, secure new ones, oversize, and have the tank connection tapped out larger.

So much for the section tube connections. One will notice a lower pipe from the bottom of the vacuum tank to the carburetor in Fig. 5. If the connections at these two places become loose, gasoline will drip out and the vacuum tank will be drained. These joints can be tightened in the same manner mentioned above.



6. Carburetor Floods. The gasoline is supposed to be at a certain level in the float bowl. If it gets too high it will drip out. This may be caused from several things:

First: Trash may get by the screens and lodge under the float valve. This will allow the float bowl to become too full, thus dripping will occur. By removing the cap over the float valve one may press down on the valve and twist it around so as to dislodge any trash collected there. If, after holding the float valve down for awhile the gas quits dripping, one is quite sure that the valve is in good shape. The trouble must be in the float not working right. However, if the gas continues to drip, the float valve needs grinding or may have to be removed. This little valve can be ground by placing valve grinding material on it and twisting around on the seat with slight pressure. After grinding in this manner, one must make a slight adjustment due to the fact that the valve is slightly shorter and the seat slightly deeper than before.

Second. If, as mentioned above, pressure on the float valve stops the leak, the float must be out of order. Floats are commonly of two types, (a) cork, and (b) hollow metal.

The cork float is usually coated with a very thin layer of shellac. If the shellac covering breaks, the fuel enters and causes the cork to become "water logged", so to speak. It will not float in this condition. It can be removed and coated by dipping in a very thin solution of shellac. Before coating the float, it is well to dry it out thoroughly by placing it near a stove or hot radiator to drive off the liquid.

The hollow metal float may spring a leak. This can be discovered by placing it in a bucket of hot water. If a leak is present, bubbles will be seen coming from the hole. To get rid of any fuel which may be in the float, punch a small hole into the top and bottom to be sure that all the liquid escapes. Then solder up all the holes using a small soldering iron and a small drop of solder. Heavy lumps of solder may make the float too heavy. After the soldering is finished, again test the float in hot water for leaks.

PARTS THAT GIVE TROUBLE IN THE FUEL SYSTEM

7. Vacuum Tank Air Vent. The air vent, to the lower portion of the vacuum tank, is indicated by the arrow in Fig. 7. This vent maintains atmospheric condition in the lower chamber. Also it serves to prevent an overflow of gasoline in descending steep grades. This vent may become stopped in some way or other. Run a wire through it.

8. Leaky Vacuum Tank Float. One can remove the top of the vacuum tank and take out the inner tank shown in the top of Fig. 8 by the arrow. Take out the screws and run the blade of a knife carefully around the top between the cover and the body of the tank. There is a paper gasket which is usually shellaced on. When replacing this be sure to shellac it. Shellac can be had at any hardware store or garage. This joint must be air tight. The float, to which the arrow points, Fig. 8, must be air tight. They sometimes develop a leak. Dip the float in a bucket of hot water, as described above in respect to the hollow metal carburetor float. Air bubbles indicate holes in the float. Use only a small amount of solder, as large amounts will make the float heavy.

A leaky heavy float will allow too much gas to collect in the vacuum tank and be drawn into the carburetor manifold which will choke down the engine, carbon it up, cause loss of power, and the car will use too much fuel.

It is well to test this float in hot water even though the garage man fixes it. They are not always inclined to do a good job. If one knows what is needed, one stands a better chance of getting a good job.

Another thing, the flapper valve "F", Fig. 8, may be held open on account of trash collecting on the seat. This would render the valve imperative. In order to discover whether this valve is out of order or not, first plug up the air vent seen at the arrow, Fig. 7. Detach the tubing running from the bottom of the vacuum tank to the carburetor shown in Fig. 5. Start the engine and hold a finger over the opening under the tank. If the suction is felt continuously it is evident that there is a leak in the connection between the tank and the main gas tank, or that the flapper valve "F", Fig. 8, is held off its seat thereby letting air into the tank in place of gas.

When the top of the vacuum tank is removed, as mentioned above, the flapper valve "F" can be inspected. Often this valve can be made to seat properly by tapping on the side of the tank. In case this valve is worn it can be replaced at small cost.

9. Carburetor Choke Shut. The carburetor choke valve shown by the arrow in Fig. 9 generally has a spring to hold it in open position. If this spring becomes broken or loose, allowing the valve to shift around, the carburetor will be choked and stop the engine. The wire attached to this choke valve is used to close the valve when starting the engine. When released it must go back to "open" position to work properly.

Jersey Testing at Beltsville

During 1920 and 1921 a herd of Jersey cattle was assembled by the Dairy Division of the U. S. Department of Agriculture to be used as a foundation herd in the breeding investigations. Several of the well known families of Jerseys are represented in this herd which now numbers approximately 75 females.

In order to determine the producing ability of these animals the practice is to conduct Register of Merit tests on all individuals in the herd. Records of members of successive generations are to be compared as a measure of progress, and for this reason all tests are made under conditions which are as nearly comparable as possible. The cows freshen in average condition, are milked three times a day, and are fed a standard grain ration. Grain feeding is regulated according to production, and beet pulp, when available, is fed with the grain. Alfalfa hay and corn silage are the roughages used.

The aim is to test each animal during her first lactation period and again after 5 years of age. This routine is occasionally interferred with by breeding troubles, but all normal cows are receiving identical treatment.

Since the beginning of the project, 32 cows and heifers have completed a total of 36 records. The average production is 9293 pounds of milk and 518 pounds of butterfat. An analysis of these records according to age is necessary in order to make the story complete, and the following table gives this information:

Class	No. records	Av. milk	Av. fat
		lbs.	lbs.
2 years old	15	7823	445
3 years old	9	8986	512
4 years old	4	10218	547
5 years old and over	6	11933	649

This is not a selected group, as each animal calving normally is tested once as a heifer and again after 5 years of age. Conditions for all records are as nearly uniform and comparable as it is possible to have them, and extremes of conditioning and feeding have been avoided.—M. H. FOHRMAN.

Dogs bark and the wind carries it away.—Proverbs of Russia.

Jersey Wins Second Gold Medal

Torono's Marigold Pride 425794, a five-year-old Jersey, has won her second gold medal for heavy production, with calf, and has greatly strengthened her reputation as an outstanding dairy cow.

In her last test, recently completed, Pride produced 718.29 pounds fat and 13,918 pounds milk in 365 days and carried calf for 228 days of the test.

Torono's Marigold Pride is owned and was tested by Mrs. Florence L. Heberding of Ohio.—American Jersey Cattle Club.

Cow Testing Associations

Following is a summary of reports received during the week and up to the time of going to press of this issue:

Association Notes by Testers

Westby Jersey, Wis.: Many members are feeding their cows grain and hay. Several farmers showed cattle at the Vernon County Fair and won many first prizes and grand championships. This association also furnished the American Jersey Cattle Club with three cows for their exhibits at the National Dairy Show. Last month the creamery paid 42c a lb. for fat.—H. Oehmcke.

Leopolis — Pella — Tilleda, Wis.: Five barns were whitewashed last month and one concrete barnyard was built.—W. F. Belter.

Bloomer No. 1, Wis.: Several members attended the National Dairy Show. One new silo was built. Separators were found to be doing very good work. The condensery paid $1.75 per cwt. for milk in September. Milk retailed for 7c per quart and butter for 42c per lb.—C. Wirth.

Knapp, Wis.: Of the 446 cows tested last month, 16 produced 40 lbs. or more of fat. Creameries paid an average of 42c per lb. for fat, the cheese factory 45c.—G. Peterson.

Denmark, Wis.: Every test made last year in this association was made in the nature of a surprise test. This plan works fine here. This association will complete its third year's work November 30th. Many farmers have alfalfa pasture. The high cow and high herd were on alfalfa pasture the entire month of September. The condensery paid $1.70 per cwt. for milk last month.—M. H. Nelson.

Iola, Wis.: Two barns were whitewashed. Two members consigned cows to the National Grade Sale. The creamery paid 45c per lb. for fat. Milk retailed for 10c a quart last month.—L. L. Sether.

Milton—Edgerton, Wis.: Two cows from this association were sold at the Grade Cow Sale at the National. One cow, a grade 3-year-old heifer with a record of 404 lbs. fat as a 2-year-old, sold for $160. The other cow, a 7-year-old grade Holstein, sold for $135. Her record was 381 lbs. fat. The condensery paid $1.90 per cwt. for milk in September.—W. H. Roberts.

Marshfield No. 2, Wis.: Twenty-seven herds were tuberculin tested and 7 reactors found. Three barns were whitewashed and one remodeled and sanitary steel equipment installed. Three new cement silos were erected. The Wood County area tuberculin test is nearly completed and animals are found to be comparatively free from this disease. The cheese factory paid from 44—48c per lb. for fat, the creamery 38—44c last month.—L. G. Lampman.

Footville—Evansville, Wis.: One new member joined the association. Several members are liming their soils for alfalfa. Silos are being filled. A large per cent of the corn is soft through this section. Last month market milk sold for $2.60 per cwt. The condensery paid $1.60 per cwt. for milk. The cheese factory and creamery paid 40c per lb. for fat.—A. C. Lasse.

Alma—Cochrane, Wis.: One member installed an electric light plant. The association booth at a local fair exploded the idea that it pays to buy or sell cows on the merits of guesswork. One member attended the Dairy Show.—E. R. Bailey.

Hazel Green, Wis.: Of the 330 cows tested last month, 23 produced over 40 lbs. of fat. One member erected a new silo and another is remodeling his dairy barn. Several herds were tested for T. B. with but one reactor found. A cheese factory began operation the last of September after being idle for some time.—H. L. Johnson.

Elroy, Wis.: One cow produced over 60 lbs. of fat, 4 over 50 lbs., and 9 over 40 lbs. Two herds averaged over 30 lbs. of fat. The high cow for the first three months is owned by E. Kimball and produced 179.1 lbs. fat. One member painted his farm buildings. The creamery paid 41c a lb. for fat in September.—A. G. Steffen.

Muskegon—Ravenna, Mich.: One barn was remodeled and drinking cups were installed. Several barns have been whitewashed. Last month market milk sold for $2.40 per cwt. The condensery paid $1.60 per cwt. for milk. The creamery paid 43c per lb. for fat. Milk retailed for 10c per quart, butter 39c per lb.—G. Rockel.

Remus, Mich.: Eight cows produced over 50 lbs. of fat last month. One member purchased the champion bull calf at Detroit State Fair. Several milk houses have been built and some of the members are considering installing milking machines.—N. S. Smith.

Branch Co., Mich.: The association average of 272 cows tested was 522 lbs. milk, 21.27 lbs. fat. Returns for $1.00 expended for feed was $2.48; cost to produce one pound fat, 20c; cost to produce 100 lbs. milk 84c. In September market milk sold for $2.50 per cwt. The condensery paid $1.40 net flat; the creamery, $2.50. Milk retailed for 12c per quart, butter 43c per lb.—L. Q. Kitchen.

East Oceana, Mich.: One member is building an addition to his barn, making room for ten to twelve more cows. The creamery paid 36c per lb. for fat in September.—R. Greenman.

Northrop, Minn.: The high herd, owned by R. E. McLaughlin, consisted of 14 pure-bred Holsteins and averaged 42.2 lbs. fat for the month. The creamery paid 42c per lb. for fat and fluid milk sold for $2.25 per cwt. in August. One faulty separator was replaced with a new one.—R. E. Jensen.

Dupage Co., Ill.: A. C. Konde is the new herdsman at Cantigny Farm. Tritonia Pietertje Ormsby Lad, purchased by H. C. Vial and A. W. Abbott, was first prize 2-year-old bull at the National Dairy Show and second at the Dairy Cattle Congress at Waterloo this year. Old Friend, an 18-year-old pure-bred Holstein cow owned by A. W. Fischer, dropped a fine heifer calf, the ninth calf since Mr. Fischer bought her when 8 years old. Of these offspring, six were female and three male. She has also been a wonderful milk producer, having a cow testing association record for five years and an official record of better than 14,300 lbs. milk and 492 lbs. fat. Mr. and Mrs. H. C. Vial and Mr. and Mrs. A. W. Abbott entertained the members of this association October 2nd. At the business meeting the secretary was instructed to ask the University of Illinois to issue a certificate of production of all cows producing more than 400 lbs. fat in one year. The average production of the 480 cows in milk last month was 557 lbs. milk, 20.6 lbs. fat; value of product, $14.91; feed cost, $6.85; profit, $8.07 per cow. The return per dollar expended for feed was $2.18 and the feed cost of 100 lbs. milk $1.23; of butterfat, 33c. Market milk sold for $2.60 per cwt. and retailed for 14c per quart in September.—F. D. Kasserman.

Lake Co. No. 1, Ill.: Last month two new silos were erected, one brick and one concrete stave. At the J. M. Patterson Farm the dairy barn is being remodeled and equipped with a King ventilating system. A large manure pit has been built at a distance from the barn and the yard paved with concrete, making this one of the most sanitary plants in this association. The Hawthorn Farm had a severe setback by the burning of their barn from spontaneous combustion of hay. Another barn is being remodeled on the place. Market milk sold for $2.60 per cwt. and retailed for 13—14c per quart. The creamery at Zion paid $2.85 per cwt. for milk in September.—E. A. Forman.

North Allegan, Mich.: Production has fallen off considerably due to the large number of dry cows. The honor of the high herd for both milk and fat production again goes to Bert Ter Haar's 18 Holsteins, with an average of 1,103.7 lbs. milk, 36.4 lbs. fat. Silo filling is in full swing. There is not much ripe corn, due to September frosts and the cool summer, except on the sandy soil and higher land. Last month market milk sold for $1.75—2.50 per cwt.—C. L. Fleming.

Tomahawk, Wis.: Three carloads of feed have been purchased co-operatively by members. Farmers and dairymen of Lincoln County are beginning to realize the value of cow testing associations and in the near future another association will be organized. Market milk sold for $2.00 per cwt. and retailed for 10c per quart in September.—W. S. Schneider.

Allenton—Kohlsville, Wis.: This association's National Dairy Show consignment numbered 13 aged Holsteins and 5 bred heifers, plus 10-year-old Cedar Lawn Canary Paul 6th on exhibition with 10 of the above aged cows who were "better than their dams". See write up and illustrations in last week's issue. The condensery paid $1.88—2.00 per cwt. for milk in September. The cheese factory paid 42.2c per lb. for fat.—V. M. Anderson.

Spring Green, Wis.: Cows dropped in production during September, especially where grain was not fed with pasture. Two herds qualified for the National 300-lb. Honor Roll. The cheese factory paid 42—46c per lb. for fat. Sweet cream brought 40—42½c per lb. fat last month.—A. F. Clump.

Ogle County, Ill.: Joe Hemingway's 7 pure-bred Holsteins averaged 7,651 lbs. milk and 260 lbs. fat since April 1st. Market milk sold for $2.60 per cwt. The condensery paid $1.60 direct ratio. The creamery at Polo paid 38c per lb. for fat. Milk retailed for 9—13c per quart in September.—J. Potter.

Berrien—Cass, Mich.: This association was organized September 19th. All members raise alfalfa hay and all have silos. A large number belong to the Producers' Creamery Association at Benton Harbor. This creamery is owned and operated by the farmers who supply the milk. It is an organization of high standing and is a success. Last month market milk sold for $2.50 per cwt. Milk retailed at 12—14c per quart.—H. D. Boas.

McHenry Co., Ill.: All Holsteins shown at the recent McHenry County Fair were owned by members of this association. About 50 head entered; bulls were especially strong. Two members are adding to their own and the cows' comfort by installing drinking cups. One member has added to his herd by a purchase of 23 tuberculin tested grades. Pasture is holding up very well, with most members using some kind of clover. Market milk sold for $2.60 per cwt. and retailed for 12c a quart last month.—B. McClellan.

Pine Co., No. 1, Minn.: Two new silos were erected. One new separator was purchased. The average of this association was considerably lower in September on account of the short pasture and the majorty of the cows coming fresh next month.—A. Driver.

West Allegan, Mich.: One member whitewashed his cow stable. The average of the 199 cows tested last month was 363 lbs. milk, 18.77 lbs. fat. The creamery paid 38c per lb. for fat. Milk retailed at 10—12c per quart in September.—L. A. Wilcox.

Bruce, Wis.: Three new silos were erected. Ten members fed grain to cows on pasture. The creamery paid 40c per lb. for fat last month.—C. W. Rye.

A Record Silage Yield

HOARD'S DAIRYMAN:—The corn crop of the Yakima Valley, Washington, is very good. Thirty-one tons and 740 pounds of corn silage was the tonnage produced from one acre by S. D. Cornell, as shown at the close of harvesting the corn September 28th. Last year Mr. Cornell produced 27½ tons an acre on his place near Grandview. This year he is on a new place on the Yakima River in Yakima County. Mr. A. E. Lovett, county agent, who was present and made the official record of Mr. Cornell's yield, states that this yield sets a new world's mark for an acre production.

Eight separators were found to be testing at enormous loss for the past month. Most cows are coming fresh now. The Yakima Dairymen's Association paid 41 cents per pound for fat during the month of August. The prolonged dry fall has made pasture very poor and sweet clover is gaining in favor for late pasture.

Sunnyside, Wash. J. M.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

"Take care of that farm machinery now," says E. R. Raney, farm engineer for the Extension Division of the North Carolina State College, "for although thieves may not break through and steal, the rust will sure get them, which is just as bad."

Real Butter an Election Issue

HOARD'S DAIRYMAN:—On billboards in Oregon towns appears this slogan; "Guard Your Homes and Your Pocket-books.

"Don't Pave the Way for One Dollar Butter.

"Vote No. X 307".

No matter whether the town be large or small the sign will be there somewhere, urging people to vote to repeal a law designed to protect the dairy interests.

Briefly stated, this law would have prohibited the manufacture or sale of any condensed or evaporated milk containing vegetable fat; also the sale of any substance containing milk or milk products combined with vegetable fats.

It is the old story of the snake killed during the day wiggling its tail until sundown; only the margarine clique did not intend the sun to go down until their creature thus rendered insensible but not killed should be completely given back to liveliness. The law passed in 1923 was made inoperative by the margarine interests invoking the referendum and so the dairy people are back where the fight must be made again.

In the state of Oregon, proposed amendments are printed in pamphlet form, with arguments for and against, and distributed to every voter. In the arguments given by the Margarine Committee, in this official pamphlet, these claims are made:

"The cost of living will be increased if the law is allowed to become operative. The housewife who now pays 25 to 28 cents for nut margarine will be compelled to put twice that amount or more for butter."

The Margarine Committee put in a good word for the big, or little, brother of nut margarine, oleomargarine, by giving a quotation attributed to Dr. Wiley: "Oleomargarine, as made today, is pure, palatable, and more nutritious than butter." And Dr. Wiley writes he has been misquoted.

In their argument that their product is being discriminated against, the Margarine Committee says: "You can buy a product made of milk and *animal* fats, but you can not buy a product made of milk and *vegetable* fats." Granted that this *is* discrimination, the vegetable oil people may rest assured that if the cocoanut oil mixtures are ruled out, the fatty mixtures can expect their turn next; and eventually there would be no discrimination.

"This measure is not fair. It is class legislation." "It invades your personal liberty and creates a monopoly," is another argument printed in black-faced type. And it is interesting to recall that 'personal liberty' was mentioned by the disgruntled about a certain National Amendment. So if the rank and file of the American people can stand a bit of curtailment regarding the matter of 'drinkables', it is quite probable that they could survive regulation regarding eatables.

The Margarine Committee's arguments close thus, "It is the latest effort through legislation to create a food trust and a monopoly." I fancy producers of food will smile at the "food trust" idea, and Echo asks, "Since when?"

Of course the psychology of voters casting a vote against any measure that they do not thoroughly understand, will help the imitation—butter crowd. Then, too, a good many voters fail to vote on amendments at all.

Quite naturally the Oregon State Grange and the Oregon State Farmers' Union favor the bill; but it is interesting to note what Otto Hartwig, president of Oregon State Federation of Labor, says in argument for the bill: "To say that substitutes for such an important article as butter are an advantage to workingmen and women, who need the very best foods to sustain strength and health and to carry on their work under the many artificial conditions of today, is a false premise. Organized labor is fighting for a butter standard of living and not for an oleo standard, and the substitution of an artificial lubricant on bread and other food compositions is false economy and a poor and unhealthful practice."

According to figures given out by the Portland Chamber of Commerce, over 500 families have come to Oregon this fall, most of them from east of the Rockies. Many of them have depended upon cows more or less for their living expenses; if this bill is killed there will be some disappointed newcomers as butter is so low now that those of us who have been here for a number of years feel that if fat does not go higher, or if it drops still lower, it will pay to keep only a cow or two, just enough to furnish butter and milk for our own use.

OREGON SUBSCRIBER.

Rastus—Here's dat quatah ah borrowed from yuh last year.

Sambo—Yuh done kept it so long dat ah don't know if it's wuff while for me to change mah 'pinion of yuh jes' fo' two bits.—Life.

Aunt Ada's axioms: for progress, we need to become as little children, —always asking questions, always in search of truth.

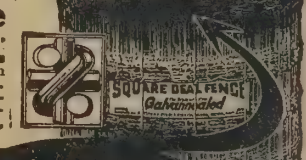
Butter and beauty got together recently when Miss Faye Lamphier, beauty contest winner of California, and Blossy's Sequel, Guernsey butterfat producer of the state, posed for the photographer at the James A. Brown certified Guernsey dairy ranch, California. Miss Lamphier, after winning first in the Santa Cruze beauty pageant, won third in the National beauty contest at Atlantic City, September 2—6, as "Miss California". Blossy's Sequel produced 822 pounds fat and represents California's Guernsey champion when considering only California produced Guernseys.

Stop Rust

Every rod of "Galvannealed" Square Deal fence is made of copper-bearing steel. The patented "Galvannealed" process welds 2 to 3 times more zinc coating into the wire. Copper mixed in with the steel together with the extra heavy zinc coating **stops rust**; therefore Square Deal lasts 2 to 3 times longer. Costs not one cent more than the ordinary kind. We'll send upon request, copy of official tests that absolutely prove these claims.

***Galvannealed* Square Deal Fence**

has these other good points: Stiff, picket-like stay wires require fewer posts—always tight and trim, no sagging; full gauge wires last longer; famous Square Deal Knot guaranteed not to slip; well crimped line wires give live tension, secure against strains and sudden weather changes.



Two to three times more zinc —more wear—no extra price

Write today for official proof of tests, also get our catalog—and—a copy of Ropp's Calculator (answers 75,000 farm questions). All 3 free. Address

Keystone Steel & Wire Co.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., OCTOBER 20—L. H. Goddard, of the U. S. Department of Agriculture, who has recently returned from an inspection trip through the Middle West and Northwest, reports a decided trend toward a most unusual increase in acreage of wheat and corn the coming season.

Mr. Goddard points out the probable result of the present trend in the wheat and corn belts. "They are literally 'tearing up the earth'," he says, "to get winter wheat into the ground and to get land ready for corn." Some estimates already point to a ten per cent increase in wheat acreage. Mr. Goddard's report forecasts an even larger increase.

⚜

Although it is recognized that the situation which in April or earlier started the agitation for an increased tariff on butter, has entirely changed, so that there are no imports coming now, still the wheels of governmental action set in motion at that time to secure a Tariff Commission investigation, are still grinding along, slowly and certainly. The investigators sent to Denmark, including Professor Warren of Cornell, are back home, and the data secured are being worked up by the Commission's staff, being prepared for the "Statement of Information" which is issued preliminary to the public hearing which the law requires to be given before the Commission takes action in any case. The investigators sent out into the butter producing sections of the United States to secure cost data have also reported, and this information is also being worked up for inclusion in the same public document. This, when issued, will bring the question of "foreign" and "domestic" costs into parallel columns, so the inference is that the total cost per pound found for Denmark and the total cost per pound found for the United States will be the figures whose difference will establish the rate of tariff which the law says should be established by the government. This is the grist which the wheels of agitation, started last April, will grind out of this Tariff Commission mill. There is now some expectancy that this report will be ready within a month and that within a month after its issue the hearing will be held. If the difference as found by the Tariff Commission is more than eight cents a pound higher here than in Denmark, then the tariff increase will be recommended, but if the difference is less than eight cents a tariff decrease may be reported. The only other alternative is to find some flaw either in the Commission's figures or their methods of making the investigation.

⚜

Professor Graves, head of the research section of the Bureau of Dairying, dealing with the problems of breeding to establish high producing lines, is on an inspection trip in the West. He will check up progress on the experiments now going on in his work on the various dairy stations and with some of the co-operating colleges and state experiment stations.

⚜

H. J. Rabild, who has been in charge of the Dairy Bureau plant at Grove City, Penn., has resigned and gone to Denmark for a visit and study trip. He will be gone some months.

⚜

Anticipating the beginning of Congress sessions early in December, the Appropriations Committee will begin work here about the middle of November on various appropriation bills. For example, the Agricultural Sub-committee, Hon. Walter Magee, chairman, will start hearings on November 17 on the agricultural budget, in preparation of the bill which will be ready for introduction, it is hoped, by the second week in December. Prior to the hearings, the Budget Bureau will have completed all work and have the entire proposed appropriation for the work of the Department and all its bureaus completed and approved. In fact this budget for the Department of Agriculture is nearly completed as this is written. Requests for special appropriations must be prepared for submission to the Magee Committee at an early date, if any consideration is secured before the bill is reported to the House.

⚜

Two legislative proposals have been agreed upon by the National Milk Producers' Federation, action to be taken on both of them if the situation in Congress warrants. One of these is to oppose any legislation which may be offered, or has been offered, which has as its object the bringing of co-operative marketing organizations and activities further under government control or license. The other is to propose the repeal of the flexible tariff proviso under which the effort to reduce the duties on vegetable oils and on casein have been made. "We have been the victims of experiment," says Charles W. Holman, secretary of this organization, "and we have been hurt and not helped. The only people who are still in favor of this proviso are those to whom it is a beautiful theory and who have had no practical experience with it."

⚜

Quarantine regulations, fully as strict and as restrictive as were placed by the various states against the shipment of anything from California which might spread its epidemic of foot and mouth disease, have been placed very generally against Texas products, since the outbreak there, according to information at the Bureau of Animal Industry. The news from Texas at this time is very encouraging, however, indicating very close confinement of the outbreak to the areas where it was first discovered and fine co-operation from all concerned.

Community Fair a Success

On October 9th the annual community fair of Princeton, Wisconsin, was held in the high school building. This is an annual event and is much looked forward to by the children of the community and their parents.

Beginning the day before the fair and continuing through the morning and up until noon the day of the fair exhibits were being poured in from every side of the town and country around Princeton. These exhibits included poultry, calves, field crops, and vegetables that were entered by the boys and girls of the school.

Besides a large number of the townspeople, there was a particularly strong showing made by the country people. The rural schools of the community closed for the afternoon and the children and parents came in to the fair with the teachers.

The seventh and eighth grade agricultural class of the Princeton schools put on a parade which was a rather novel feature and stirred up considerable interest in the fair in town. Dressed up in farmer costumes and carrying agricultural posters which they had made they went down and back through the main street.

At about three o'clock the crowd gathered in the assembly and filled it to capacity. Professor F. E. Kelly of the high school opened the program with a few timely remarks and introduced R. L. Liebenberg, the agricultural teacher who took charge of the program. The Girls' Glee Club sang a group of songs. Following this Miss Gordon with her Senior typewriting class gave a demonstration of rhythm and speed work which proved very interesting. Professor Moore gave a talk emphasizing the value of agricultural education. Three high school boys gave an interesting and practical demonstration on poultry housing, culling, and feeding. County Agent Lacey then spoke on the value of club work and strongly urged more boys and girls to get into the club work next year. The list of prize winners was then read by Mr. Liebenberg.

Another feature in which the women and girls took great interest was the demonstration which was put on in the sewing room under the direction of the Domestic Science teacher. Three high school girls gave an excellent demonstration on the care of a child.

Exhibits were prepared and put up in each of the grade rooms and they proved an interest to many of the people present and particularly to the teachers. All in all the fair was a success not only in the immediate result but that it exemplifies what can be done along the line of school work and in school which is going to have a far reaching and beneficial effect not only upon the children but upon the community as a whole.—R. L. LIEBENBERG.

A bottle of milk is a bottle of health

Every Thatcher Superior Quality Milk Bottle has the nationally advertised Trade Mark blown in on it—for your protection and guarantee.

Nine widely separated factories assure you prompt and efficient delivery service.

THATCHER MANUFACTURING COMPANY

State Champion Jersey Wins Medal of Merit

Sophie's Emerald, the Jersey butterfat champion of New Jersey, has again distinguished herself by completing an exceptional official test, this time in the 305-day division.

Emerald started this test when eight years of age, and in 305 days she produced 772.18 lbs. fat and 14,204 lbs. milk. She dropped a living calf within fourteen months of previous freshening and thus completed all the requirements for a Medal of Merit.

The winning of a Medal of Merit in the 305-day division is a much greater achievement than it might at first appear. Only three other cows have qualified for the award in this division.

Emerald established her reputation as an outstanding producer when she made a record of 940.46 lbs. fat and 16,900 lbs. milk at six years and four months of age, and became Jersey butterfat champion for the state of New Jersey. She was also tested as a senior three-year-old when she produced 552.52 lbs. fat.

Sophie's Emerald is owned by P. H. B. Frelinghuysen.—The American Jersey Cattle Club.

Milk Record Sheets

For years Hoard's Dairyman has been preaching the necessity of keeping records of the production of each cow. Only by knowing how much milk each cow actually gives is the dairy farmer able to improve his herd. Our Book Department has various sizes of milk record sheets to make it easy to keep tab on your cows. Complete samples with price list will be sent for 5 cents in stamps. Address Hoard's Dairyman, Fort Atkinson, Wis.

EDITORIAL COMMENT

THE CHRONIC KICKERS

Some creameries have great success and some have miserable failures. How often do boards of directors of co-operative creameries sit far into the night discussing problems and ways and means of solving these problems and finally adjourn the meeting with little accomplished? Each member of the board feels for himself that something can be done and that something ought to be done. They hesitate, and are lost because some member of the board ventures the opinion that, if they take favorable action on the proposition discussed, some half dozen of the several hundred patrons will not agree with the board's action.

A few good men on the board of directors of a creamery are worth thousands of dollars to a community if they have the ability to find out what is wrong, agree on the best remedy and see that the remedy becomes effective. Men of this kind often do not get the degree of appreciation from the community that they deserve.

A few chronic kickers among several hundred good patrons are often a very great menace to the success of the creamery. Boards of directors could well afford to pay less attention to this very small group.

CARELESSNESS AND FIRE

Fire losses through carelessness are tremendous. They have become so great that the week of October 5 to 11 was set aside as National Fire Prevention Week. In five years, from 1915 to 1919, the loss by fire in the United States, due to defective chimneys and arrangement of stove pipes, amounted to $56,650,915, according to statistics given out by the National Board of Fire Underwriters. We consider this a very heavy price to pay for carelessness.

The farmer, in particular, should be sure to examine his chimneys at least once a year, and if the stove pipe passes through the ceiling it should be properly insulated. A tile may be used or metal thimble which may be obtained from any hardware store. In dry weather, care should be exercised in starting fires. We know of several roofs of houses that caught fire by lighting loose paper in the stove or furnace. The draft carried it up the chimney, it fell on the roof and set it afire.

We consider it a good practice to keep fire extinguishers in the barn, in the house, and in the garage, as they contain substances that are very effective in putting out small fires. They are not expensive and any one can operate them. If fire extinguishers are placed about the different farm buildings they should be inspected at least once a year to determine whether they are properly filled with chemical and otherwise in working order.

BRING BACK CLOVER

Many sections of the country that once grew red clover successfully find it difficult to get a stand or to have it live through the winter. We know of certain sections of states where red clover grew so persistently that it became as troublesome as some weeds. Institute speakers in such sections have taken up the problem of how to destroy red clover. After these soils have been cropped for a series of years, there seems to be no danger of red clover being in any way troublesome to crops that follow, and the farmers find difficulty in getting red clover to grow. What have the plants taken from the soils that once grew red clover successfully that now makes more failures than successes?

We doubt whether our soil specialists or scientists have really gotten to the bottom or accounted for all the reasons why soils will not produce clover now as well as when they were new. We feel rather certain that the application of lime to sweeten the soil, the use of some phosphate to make up for the deficiency of this element in soils, and the application of manure will in a great many cases prepare the soils so red clover can again be grown. Perhaps there are other things not yet discovered or thought of that are important to growing clover.

It is advised in a recent bulletin by the Wisconsin Experiment Station, entitled "Bring Back Clover", that "many failures of clover are due to the use of late ripening and rank growing grain crops. Early ripening grains do not exhaust the moisture of the soil so completely nor do they seriously crowd the clover seedlings. Cutting the grain and hay is an extra insurance for success on many farms where clover is now a failure."

CO-OPERATIVES AND GOVERNMENTAL CONTROL

The directors of the National Co-operative Milk Producers' Federation at their meeting in Milwaukee, Wis., Sept. 29th, declared their opposition to further governmental control over co-operatives through boards or commissions. A number of co-operative bills introduced in Congress last winter well indicate the way the wind is blowing.

We had occasion to review a number of these bills; some of them provided for the federal government to take complete charge of co-operative efforts throughout the United States. We believe there is opportunity for the government to assist in forming co-operative enterprises, to act in an advisory capacity, to supply useful information concerning markets, both at home and abroad, and to aid in the standardization and the grading of farm commodities. But it is going too far when they establish machinery which will have control of organizing co-operative institutions in the various states and in directing them. Successful co-operation depends upon educating the people in every local community regarding the principles and practices of co-operation.

It has taken about thirty years for the farmers of Minnesota to learn how to co-operate in building and operating successful co-operative creameries. The next step, and the one they have taken, is the federation of these creameries that they may market their butter under a brand and collectively. It is far better for the co-operative movement in Minnesota that the farmers had their past experiences in operating their local institutions. They are now more capable of forming a federation.

So much can be done for people that it will become harmful to them. Men and women grow strong by doing things, by meeting problems and solving them. Actual contact brings understanding and that is what is needed for success. The board of directors of the National Milk Producers' Federation fully appreciates that it would be a mistake to have the federal government placed in control of all co-operative enterprises and we approve of their protest which they have made against any such step.

IMPROVEMENT IN AGRICULTURE

The advance in prices of agricultural products has brought encouragement to the farmer and those directly dependent upon him. There is a different tone in letters, communications, and articles by all interested in the welfare of agriculture. The United States Department of Agriculture in its October report of the agricultural situation says: "It is by all odds the finest harvest in five years—not the greatest in physical volume of products, but the best balanced and representing the best income. There is no single case of serious scarcity among the major products; neither is there any serious overproduction."

Dr. David Friday, formerly president of the Michigan Agricultural College, has stated: "American agriculture has just turned a corner. It is the final turn to the right that leads out of the slough of depression on to the high road of prosperity. It may be that we are facing a decline in the general price level of all commodities during the next decade or two. If prices should decline, what has been said here will lead to the conclusion that farm prices will decline less than other prices."

Banks make a close study of both agricultural and industrial situations. It is their business to know the financial conditions of all classes of industry. "Agriculture," according to the National Bank of Commerce, New York, "is in the best financial position since 1920, and the prospect is for good crops and fair prices."

Still, we have a few leading agricultural products, the prices of which are lagging behind. Beef cattle in particular are not selling at prices in keeping with other commodities. The advancement in prices, however, in almost all classes of farm commodities for the past few months has been sufficiently rapid to bring encouragement and new inspiration to the farmer.

EFFICIENCY OF AMERICAN FARMER

The four important countries of the world listed in order according to quantity of agricultural production are: United States, Russia, China, and India.

The United States has a population of 100,000,000 people and a total land area of 3,000,000 square miles. The combined population of Russia, China, and India is 844,000,000 people and the combined land area is 14,726,000 square miles.

The interesting thing about all of this data to every United States citizen is found in the fact that the United States with 100,000,000 people produces nearly 70 per cent of the entire world's corn, 60 per cent of the world's cotton, 50 per cent of the world's tobacco, about 25 per cent of the world's oats and hay, 20 per cent of the world's wheat and flaxseed, 13 per cent of the world's barley, 7 per cent of the world's potatoes, and 5 per cent of the world's sugar.

The most interesting thing about it is the fact that only about six and a half million families in the United States are engaged directly in agricultural production. Only about a quarter of our gainfully employed population is engaged directly in agriculture, whereas, about 85 per cent of the people of Russia and about 75 per cent of the people of China and India are classed as agricultural.

What does it all mean? First of all it means that the farmers of this country are the most efficient producers of agricultural products in the world; second, and because of this fact, it means the release of large numbers of our population to other occupations the results of whose labor, when consumed by our entire people, make the most enjoyable standard of living in the world. It means that the pioneer farmers, journalists, teachers, and scientists in the agricultural field have laid a foundation, the present reward of which is the almost unmeasurable opportunities of our people to enjoy life.

Do the American people really comprehend and appreciate the tremendous importance of the efficiency of the American farmer?

Among our chief problems today are increasing the efficiency of the distribution of our products and making a fair and equitable distribution of the results of labor.

We believe that these problems can be more satisfactorily solved by working from the inside out rather than placing too much emphasis on working from outside in. Self help, mutual understanding, confidence, faith, ambition, and enthusiasm are worth more towards real accomplishments when applied from the inside out than all of the "outside in" helps that we are too frequently considering.

Why Tin and Gum Rubber

Why are milk cans, buckets, and all milk utensils made of tin? Would galvanized iron affect the milk in any way? Why are all rubber milk tubes made of pure gum? Would not ordinary rubber lined spray hose do as well for milking tubes on milking machine?

Lamoille, Nev. L. J.

Strictly speaking, tin is an inert metal that does not yield to the action of acids and brine. However, it is too expensive for use alone in the making of most utensils, particularly as it may be put on as a protective coating over cheaper metals (such as sheet steel, iron, copper, etc.) and produce as good if not a better utility product as pure tin. The heavier the coating of tin these baser metals receive, the better is the resulting product that is commonly known as tin.

Milk utensils are made of tin for the reason that it does not readily corrode and look distasteful. Being smooth and shiny, it is relatively easy to wash and sterilize. It is very much less soluble in milk that becomes sour than is zinc, copper, iron, and similar base metals that have thus far found a large place in dairy utensils. It has been abundantly shown that metallic flavors of milk and dairy products are related to the solution of some of the metals in milk utensils that are not properly coated with tin or nickel. Galvanized iron would be particularly objectionable because it has a rough coating that makes it difficult to wash thoroughly and the action upon it of the acids of milk would be detrimental to the quality of the milk.

The common rubbers are highly impregnated with mineral salts which dissolve in and impart a bad flavor to milk and its products. Pure gum rubber is much more pliable and will not develop cracks nearly as quickly as would rubber lined spray hose. It is rather difficult to keep the rubber parts of the milking machine in good condition. This is due largely to the development of minute cracks into which the milk penetrates and from which it is impossible to remove it. Bacterial growth occurs and under the constant change of pressure the milk with its content of bacteria is forced out of the cracks and the milk becomes well seeded with bacteria that will cause undesirable fermentations.

The rubber lined spray hose will not stand a great deal of sterilization with either heat or chemicals. The pure gum hose is more sanitary, flexible, and will last longer. It is probable that its greater cost does not warrant its use for the vacuum hose. The U. S. Bureau of Dairying recommends that teat cup rubbers should be made from "pure gum" compound to avoid rapid deterioration.

Finds Iodine Valuable

HOARD'S DAIRYMAN:—In the July 4th issue of Hoard's Dairyman reference is made to iodine for animals. I have used one teaspoonful tincture of iodine in 2 quarts water as a vaginal douche, with very good results in treating catarrhal infections of the cow and of the sow. Have also used it with good results, in combination with potassium iodide, following abortion, retained afterbirth, and for sterility due to infection.

Iodine stimulates the thyroid gland, and the thyroid has a friendly influence on the ovaries, hence anything that strengthens and improves the functions of an organ should also increase the powers of resistance of that organ to infections. I have used potassium iodide in water with very good results in slop for sows and in drinking water for cows, as a means of overcoming infections. Potassium iodide is a splendid internal antiseptic and has a tendency to "purify the blood". Iodine, or iodide of potash, when used by mouth should be well diluted with water.

Calcium iodide is very useful in affections of the lungs and bronchial tubes, and there may be some good in the idea advanced by B. W. H. that iodine may help to ward off tuberculosis. Iodine is found in sea water, also in some kinds of rock salt, hence it would be well to keep rock salt before live stock at all times. Perhaps the nearest experiment station can say where rock salt containing iodine may be obtained.

Lugol's solution of iodine is very useful as a vaginal and uterine douche, but I prefer sodium hypochlorite solution as being cheaper, more effective, and less danger of caustic irritation. I have used tincture of iodine very considerably in treating sore mouth, bull nose, and necrotic infections of the face in little pigs, but after considerable experience with potassium permanganate, very strong solution, have adopted the potassium permanganate treatment almost exclusively for these necrotic lesions and for necrotic enteritis (scours). As a regular practice, the tusks of the little pigs are carefully clipped immediately after birth, and then piggie is dipped in a solution of potassium permanganate, 15 grains to a half pint of water, head first and up to his eyes. Since working out this treatment, I have had excellent "luck" in saving little pigs.

The navel cord should be tied with twine disinfected with iodine, then the navel cord clipped and thoroughly painted with tincture of iodine, full standard strength. This should head off a lot of joint-ill, pneumonia, and scours in calves, colts, and pigs.

Florida. F. W. BURG.

Fire Dry Seed Corn

A high yield of corn depends upon good seed and good soil fertility. Good seed corn depends upon field selection, fire drying, and testing. The high yielding pure line strains of dent corn now grown throughout Wisconsin are larger eared, deeper kerneled, and larger, leafier plants and thus later maturing than the shallow kerneled low yielding varieties formerly used. Fire drying and storing in a cool, dry place insures a vigorous seedling free from disease which is resistant to disease and, therefore, can be sown earlier in the spring and thus increase the growing season. To illustrate: two lots of seed corn were selected from the same field. One was cured rapidly at 100 degrees F. while the other lot was stored in the barn without fire drying. Both were planted in a field near Verona on May 10, this past season. The fire dried corn gave a stand of 96 per cent of strong plants in contrast with a stand of 62 per cent in the portion of the field planted with the barn cured seed.

Select Seed Corn from the Field

Select the seed corn in the field before a hard frost. Take only ripe ears of good type well enclosed in dry husks, growing on stalks that are still green. Avoid dead, dry stalks for these are prematurely ripe due to disease and the disease germs are carried in the seed. In case the corn is shocked, select the best ears at the time of husking. Select double the number of ears needed for seed to enable you to discard poor ears.

Fire Dry the Seed Ears

The corn should be cured immediately. This fall, the average field selected corn has 32—40 per cent moisture. Experiments at the College have shown this moisture should be reduced to about 12 per cent by drying where the air is heated to 65—70 degrees F., or preferably 100 degrees F., and circulated rapidly between the ears of corn. After drying, the ears should be selected, shelled, and stored in a cool, dry place for the winter. Corn dried to about 12 per cent moisture and stored in a dry place is resistant to attack by molds and is not injured by ordinary cold weather. The germ thus remains strong and free from disease and results in strong seedlings capable of withstanding cold, wet weather and the attack of root rot germs during the early spring growing period.

Test the Special Seed Ears for Germination

The ears should be further selected during the winter and all with chaffy kernels or dull lustre should be thrown out. The remaining ears should be tested by germinating six kernels from each ear as described in Circular 58. Save for seed the ears which show a large, vigorous sprout on the germinator.

The man who purchases seed corn for next spring should investigate the source of the seed and be certain that it has come from a responsible grower or seed house specializing in seed corn production and fire drying of seed. The responsible, progressive seedmen specializing in seed corn production have all installed special drying apparatus for fire drying seed corn.

The combination of field selected, fire dried, and tested seed, sown early on well prepared clover land, has given an average increase in yield of 22 bushels per acre over the ordinary methods of growing corn.—R. A. MOORE and J. G. DICKSON, Wisconsin College of Agriculture.

Silage Variations

HOARD'S DAIRYMAN:—Last fall both my silo corn and field corn got frosted on September 5. This silo corn was just in blisters. I had soy beans planted in this silo corn and the beans had almost ripened enough for seed when frosted. Having a tractor and a cutter, I went to work and put this frosted mass into the silos.

Just what to do with this field corn I didn't know. Part of this corn was just in dent stage and some nearly ripe to cut. I let it stand two weeks longer in hope that it would ripen more, but this didn't seem to help matters any. It just stayed kind of soft and I was afraid to risk it to crib. Having two silos and by starting to feed right away, it gave me plenty of room to put this field corn in the silo, so I made up my mind to play safe and put this in the silo. This was kind of a slow job, having to haul it one and one-half miles, cutting just what we could haul and cut each day with three wagons. When I started to cut, my three boys would start to load the wagons, and I cut with one team and they would use the other team to load the wagons. When loaded we would use both teams and the tractor to haul them home. When ensiling we put on plenty of water, and it kept fine.

When we finished feeding the silo corn out of one silo, we started on the other with the field corn. My cows came up in milk flow in forty-eight hours from one to one and one-half pounds milk at each milking. That is what I can't understand, coming up in milk on silage made from frosted field corn that had stood more than two weeks after it was frosted.

When cutting this corn into the silo, the corn came through the cutter just like corn out of a corn sheller, all shelled off. Now this corn come through the cow whole, so I turned my hogs into the straw shed, and, believe me, the manure from the cows and skimmilk was all they needed. On April 14 I started on the other silage again, and in three days the cows dropped from one to one and one-half pounds milk each. Otherwise the same grain and other feeds. I just can't understand it.

Lisbon, Ohio. J. M.

We are unable to give any definite information concerning the apparent difference in feeding value of the two classes of silage. We believe, however, that it is merely a case of the immature silage not furnishing a sufficient amount of nutrients for cows to produce at their full capacity.

The following table gives the total pounds of dry matter in an acre of corn when cut at various stages of growth:

		Dry matter Lbs.	Percentage of usual silage stage
August 28	Silks drying	4,567	51%
September 10	Milk stage	6,174	70%
September 24	Glazing stage	8,104	90%
October 1	Silage stage	8,929	100%

This table would indicate that an acre of corn cut when the kernels are forming would be only half as valuable for silage as when cut at the usual silage stage. This, in part, is due to the lower yield per acre, as well as to the higher per cent of water in the immature corn.

Other experiments show that when corn is cut at an immature stage, such as when in the milk or before, there will be approximately 13.3 lbs. of digestible nutrients in 100 lbs. of such silage. If the corn is cut when well matured and at the usual silage stage, a hundred pounds of the resulting silage will contain approximately 17.7 lbs. of digestible nutrients. It would be necessary to feed 40 lbs. of the immature silage in order to equal in feeding value 30 lbs. of the mature silage.

We are unable to say as to whether the relative feeding value of the two grades of silage would be just in the above ratio, but it is probable that they would tend to approximate this. In other words, more pounds of the immature silage than of the mature silage must be fed in order to secure equal results. If the more mature corn had been allowed to stand in the field for a longer time, it is quite possible it might have so deteriorated as to not be superior to the silage made from the immature corn. Also, if care had not been exercised in ensiling the frosted corn, it is possible that the spoilage would have been sufficiently great to offset any increase in feeding value that might have been secured by reason of its greater maturity.

DAIRY EXHIBITS AT SOUTHEASTERN FAIR

F. R. EDWARDS, GEORGIA

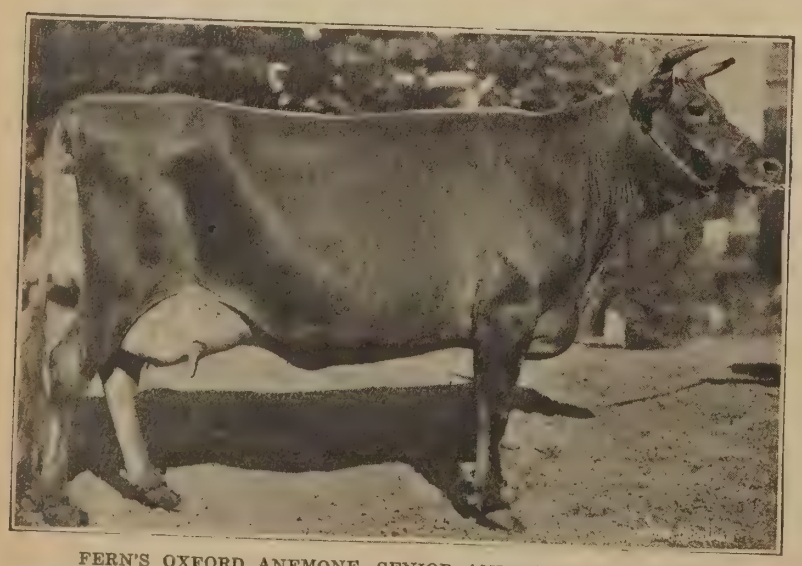
"UP to standard" is a good way to describe the dairy cattle exhibits at this, the South's greatest agricultural show, and that is saying a lot, for whoever has attended the Southeastern in years past knows that the standard is not a low one and that a championship won at Atlanta is one worth taking home. When one considers the fact that not only does the best in the territory south of the Ohio and east of the Mississippi Rivers show here each year but also a lot of the best from north of the Mason and Dixon line is attracted by the premium list, it is no wonder that competition is keen.

The supremacy of the Jerseys and Guernseys over other dairy breeds in the South was pretty well shown by the fact that southern herds cleaned up the championships in these two breeds, while northern exhibitors ran away with things for the Ayrshires and Holsteins. This has been the usual happening in years past and the really surprising thing about this year's show was the increased strength of the southern breeders of the last two breeds of cattle over previous years. If this keeps up for a while longer, the exhibitors from the North of Holsteins and Ayrshires will have to watch their laurels when they come to the Southeastern. The southern breeders have shown an increasing tendency in recent years to get the best regardless of price when they go shopping.

The Southeastern Fair opened on Saturday, October 4th, this year and ran for eight days. It was succeeded this year on the southern show circuit by the Georgia State Fair and by the North Carolina State Fair, both of which came the following week. The fair officials stated that this year's attendance was unusually large and that the exhibits were very good. They further stated that they are expecting to have the premium list on dairy cattle heavier next year than heretofore in recognition of the increasing importance of the dairy industry in the South's agricultural system.

The collegiate student judging contest was won this year by the team from Mississippi A. & M. College which was coached by Prof. C. J. Goodell. Clemson's team won second place in the contest.

The dairy cattle exhibits were judged by Hugh C. Van Pelt. In the Ayrshire classes Lippett Farm of Rhode Island made a clean sweep of the championships winning junior, senior, and grand championships on bulls and junior and grand championships on cows. This herd showed well and did credit to the breed. The Ayrshire classes were not well filled, only two herds were on hand to compete. The senior and grand champion bull was Iroquois Scotchman 20217 and the senior and grand champion cow was Iroquois Sallie Winter 56301.



The Guernseys were well represented and competition was keen. Appletree Point's Morose Conquest 94066, owned by John S. Candler, Georgia, was junior champion and grand champion bull. The senior championship on bulls was taken by Glenwood Sunburst of Clover Farm 73357, a splendid animal owned by James L. McIntosh of South Carolina. In the Guernsey female classes Judge Candler won all championships. His imported heifer, Osceola France Beauty 146679, well merits her name and could stand in stiff competition at any show. She proved this by winning the junior and grand championships. A Candler cow, Mabel Sequel 121582, got the senior championship.

IMP. OSCEOLA FRANCE BEAUTY, JUNIOR AND GRAND CHAMPION GUERNSEY FEMALE AT SOUTHEASTERN FAIR
OWNED BY JUDGE J. S. CANDLER, GEORGIA

The writer doubts whether the Southeastern Fair has ever seen so many good southern-bred Holsteins as were shown this year. Echo Segis Mercedes Vashti 443738, owned by Clark & Smith of Kentucky was awarded the junior and grand championships in the Holstein-Friesian bull classes. The senior champion was a remarkably fine specimen of Holstein masculinity,—Illini Tatomia Pride 291428, owned by Mr. Elmer Frazier of Indiana. It is worth noting that the senior championship on bulls was the only Holstein championship going to an animal north of the Ohio River this year. In the Holstein female classes Clark & Smith had their own way with championships. Their heifer, Echo Segis Farmstead Pietertje, took both junior and grand championships and their cow, Blue Grass Colantha Alcartra 579861, was made senior champion.

The Jerseys are sometimes called the "standby" of the South in dairying and this seems to have been borne out by the showing this year. The competition in Jerseys was very keen and only the best animals in the breed stood any chance at championship honors. Three of the outstanding herds showing were those from Pebble Hill Plantation, Georgia; Camden Terrace Farms, Ohio; and Mr. Wm. McPherson's farm, Georgia. The junior champion bull was Bright Volunteer 232545 of Pebble Hill Plantation and the senior and grand champion Jersey bull was the well known Adelina's Sultan 220435 also from Pebble Hill. It should be said here that Wm. McPherson's fine young junior yearling, Xenia's Sparkling Sultan 219146, gave Bright Volunteer a very close race for the junior championship and was said to have lost chiefly because of Volunteer's splendid conditioning. Adelina's Sultan had some stiff competition, in spite of the fact that he had been doing so well wherever he had been shown in the northern states show circuit. It will be remembered that he was second only to Mr. Frelinghuysen's Fern's Wexford Noble at the National Dairy Show a few days before. Mr. and Mrs. Harvey and the Pebble Hill people have good reason for being proud of this splendid representative of the breed.

FERN'S OXFORD ANEMONE, SENIOR AND GRAND CHAMPION JERSEY FEMALE AT SOUTHEASTERN FAIR
OWNED BY MR. & MRS. P. W. HARVEY, GEORGIA

Among the Jersey females there was a good showing and well filled classes. Tiddlewink's Distinction 557-551 from Camden Terrace Farm took the junior championship and Fern's Oxford Anemone 617172, owned by Mr. and Mrs. Harvey of Pebble Hill Plantation, was made senior and grand champion.

A very pleasing incident of the show was the presentation of a sterling silver writing set to the new superintendent of cattle exhibits, W. T. Bennett of Georgia. This is the first year that Mr. Bennett has filled this position and he has given such satisfaction that the fair officials are going to try to retain his services each year. He smoothed over many rough places for the exhibitors and herdsmen and handled things with a smoothness and efficiency that would be hard to beat.

Bone Meal for Depraved Appetite

HOARD'S DAIRYMAN:—In your issue of August 15th, on page 117, appears a query about "Depraved Appetite", and I very much doubt if your answer is the best advice. Here in South Africa this craving is pretty common. Stock don't stop at rotten wood and boards, nor even rags. I saw a post-mortem on a cow once when they took 2' 4" of barbed wire out of her. I've seen nails, stones, and even bits of glass bottles inside slaughtered animals.

Our Government Veterinary Research Department has recently completed exhaustive experiments on this craving and have proved beyond all doubt that it is due to a deficiency of phosphorus. This can readily be overcome by giving stock free access at all times to bone meal, which has been carefully sterilized and which can be guaranteed free of anthrax spores.

Not only does bone meal cure and prevent the unnatural craving of cattle for sticks, decayed bones, and other offal, but digestive troubles soon disappear and unthrifty animals rapidly improve in condition when it is fed.

Stock has been shown (not only by the veterinary department, but also by many farmers in every district) to increase in weight quicker, to eat better, to give more milk, to be able to work harder, to produce better beef, and generally to be enormously benefited by the bone ration.

A South African Friesland, "Butterfly", who gave 125 lbs. milk as a daily average for over four years, was fed one pound of bone meal daily, and when in calf 1½ to 2 lbs. each day. To this fact may largely be attributed her continued enoromus output.

Natal, South Africa. H. E. A.

Oregon Jersey Produces 911.52 Lbs. Fat

When Empress Lass of Ingleside completed her test with a record of 911.52 pounds fat she came within three pounds of breaking the world's Jersey record in the senior three-year-old class, which is now held by Ibsen's Jubilee Signal.

However, even though Empress Lass has not broken the world's record she has put up a splendid performance that merits the highest praise. She has, of course, broken the Oregon record for this age class.

This is not the first time that Empress Lass has been heard from, for she was tested when two years and six months of age, and in that test produced 759.16 pounds fat in 365 days. On this record she won both a gold and a silver medal and became second highest Jersey in the senior two-year-old class. This means that she now holds a place next to the world's champions in both the senior two-year-old class and in the senior three-year-old class.

She is owned and was bred and tested by B. G. Altman of Oregon.—The American Jersey Cattle Club.

Says Sam: As with a book, so with a man: Study him before you comment on him.

New York Dairy Notes

H. H. LYON, NEW YORK

THE success of New York dairying for the next several years is believed by many to depend upon the New York Dairymen's League. This belief is shared not alone by League members but by many non-poolers as well. Very likely too much dependence has been placed on the organization and the same is still measurably true. All does not depend on organization but the success or failure of organization will most certainly make a deal of difference to our dairymen. The elimination of unprofitable cows and feeding what are left for high production at the lowest cost is still more important. Many are saying that a less production would add greatly to profits, and various ways are suggested for the accomplishment of this. That part of the subject will do for another time.

From city business and from various departments comes the advice that we are on the eve of major progress towards better financial conditions. Generally this optimism is not shared to any considerable extent by our New York dairymen. We are at about the lowest net return for a year's work that we have been at all. Not many feel encouraged at the prospect for next year. Occasionally one argues that we are to have a better year in 1925 than this has been and that is a good thing to encourage. Our milk prices are dependent on butter prices and we are told that there are factors that will help the butter market for the year to come. Then we depend on general business prosperity for sustained markets. Business prosperity for next year appears to be encouraging. The settlement in Europe will most likely be of help. While we pay too much for feeds yet it seems likely that we may be encouraged respecting the markets for the coming year.

⚜

I have just read that the pure-bred business here is picking up. This comes from a source that ought to know. I hope and believe that it is true. At present one hardly sees much proof but it is best to have faith and prepare for improved conditions by raising young stock in the very best manner. Make them good or don't grow them.

⚜

In spite of discouragements poultry, where it has been well handled, has proved profitable and the prospect for next year is fairly good. We thought it would go with the dairy business and to some extent it has but the men who have given it attention seem to have come out better than have those who turned all their attention to the dairy. One would hesitate to advise expanding in the poultry line but for the dairy farmer who has a start in poultry as a side line it seems advisable to keep going about as begun. It is like dairying though—it must be well conducted.

⚜

There is scarcely a man, whether member or not, but believes that his prices for milk are to some extent at least dependent upon the success and continuance of the Dairymen's League. Members admit that they have not profited as have some of those who elected to stay out of it but they generally believe that they have received something more in cash than they would have had without any organization and they have done a remarkable constructive work in building up a working organization under almost the worst of discouraging circumstances. Then they find wherever they have investigated that they have realized more money than have most of those who have remained outside of the organization. The number who have received more than members is estimated somewhere near ten thousand dairymen and the present number of participating members is stated at about 41,000. This number does not vary so greatly in different months although there are changes in individuals who participate from month to month.

One of the announcements that has caused much comment is a recent decision respecting the enforcement of the League contract respecting damages where a party to the contract has refused to continue with the organization and has gone to another buyer. This decision is against the enforcement of the contract. It is on a second or third appeal and may be further appealed. It does not settle the validity of the contract for the ground of decision is that these men who violated were not members in a legal sense. They had signed the contract but not the by-laws, and it was two days before all contract signers had been voted in as members of the association. It would seem that nothing is really settled by this decision. Decisions in similar cases have been made elsewhere and the contract upheld, but it is understood that they were cases of actual membership.

The so-called pool price for milk for September is announced as $1.92. This is twenty cents above August although the various prices were almost the same, showing it would seem greater efficiency on the part of the association. This is for three per cent milk at 210 miles from New York. There are deductions of eight and a half cents for costs including advertising, depreciation, etc., and ten cents for interest bearing certificates as capital costs. This ten cents is returnable in five years as is already understood. The cash and certificate return then is $1.835 if there is no mistake in the report.

The Sheffields and a few other dealers who do not take any considerable surplus milk are understood to be a little over two dollars but their prices are not publicly announced. Both the League and the Sheffields announce a fluid milk price of $2.60 and lower prices for other purposes. It seems strange that the Sheffields do not pay almost the full price for they do not have, according to their patrons, any surplus to handle. Evidently they pool according to their own notions.

Occasionally now a man asks when his particular buyer pays more to the pool than the producer gets from it, what has become of the difference. We seldom hear the counterpart of this question which is in case a buyer takes milk for some cheaper product and pays less into the pool than the dairyman gets from that association. Evidently the two questions always belong together. Every one who thinks knows that if the organization keeps manufactured supply off the fluid market for the purpose of saving flooding and demoralizing the market and the proceeds of all are blended as all know to be the case, the blend will not be either the highest or the lowest price. Yet men ask the above question orally and once in a while in print, as was the case in Hoard's Dairyman not long ago. And he was in the pool too and should have read his contract.

Wisconsin Needs Straight Thinking on TAXES

OUR state now has the highest income tax rates of all the industrial states in the Union. Only 16 states out of the 48 have income taxes, and of these, only 6 are industrial states. Here are the income tax rates by states:

Mississippi, ½% above $2,500.
Missouri, 1% to 1½%
Delaware, 1% to 3%
Massachusetts, 1½% to 3%
Oklahoma, ¾% to 2% above $2,500
Virginia, 1% to 2% above $3,000
No. Carolina, 1% to 3% above $10,000
Arkansas, 1-10% to 1%
No. Dakota, 1% to 10% above $40,000.
So. Carolina, one-third of U. S. rates.
Montana, 1% on corporations only.
Connecticut, 2% on corporations only.
New York, 1% to 3% on individuals, 4½% on corporations. (No personal property tax)
Tennessee, 3% on corporations only.
Oregon, 1% to 6%
WISCONSIN, 1% to 7%

North Dakota, not an industrial state like Wisconsin, alone has higher rates.

But you know what happened in North Dakota!

When Wisconsin penalizes successful industry with high and yet higher income taxes and other states do not, three things happen:

1. **Many Wisconsin factories become branches and their home offices are moved to other states, greatly reducing the income tax paid in Wisconsin**
2. **Many valuable industrial men move out of Wisconsin**
3. **Few [if any] new factories from outside come to make their homes in Wisconsin**

This means loss of dollars and opportunities to every farmer, wage earner, merchant, banker—in fact, every citizen.

Farm and Factory Must Prosper Together

Learning to Express Your Thoughts

"How can I tell people what I think when I cannot express myself?" was the burden of a letter which came to me from a woman in a far off western state. This woman was well educated, had enjoyed many advantages, and has mastered her housekeeping to the point where she does have some time for reading good literature, making collections of poems, and giving a little time to painting. She says she can write good papers on various subjects for then she can take her time to look up words and copy some good sentences. But when it comes to talking, she just can't find words. How can she learn to express herself well?

I think there are probably many other women among our readers that find themselves in the same position as this woman in the West. Perhaps some of them are just a little timid, and are afraid they would not express themselves well. I think if one really has anything to say, it will be interesting to other folks. If the other party does not seem interested, even the best talker would do better to keep silent. It is a very rude habit to hold an unfortunate listener by the buttonhole and make him hear us out when he is not interested.

The first thing then in order to become a good talker, is to overcome our timidity. I believe that every woman has a great deal of knowledge and ability, as well as interesting little anecdotes, locked up in her. She must learn to express these in some attractive form before the world will be able to enjoy them or give her credit for them. If you believe this yourself you will soon overcome your timidity. If you think it is not true, then we had better be getting busy thinking and reading about something that will be worth hearing.

Let this then be the first goal to be accomplished: to conquer our own timidity. And let these be the means by which our goal is accomplished: First, let us try to think of something good every day that is worth passing on to a neighbor. We can do this by observing what we are reading, by noticing how an interesting trait of character is expressed in our children, a change of any kind that is unusual in the garden or that we find in our work. Second, try to tell only the best thing you have observed, never repeat anything disagreeable. having always in mind that your listener is worthy of the best only. Third, always use as good English as you are able to use, and do not allow yourself to get into slipshod and hasty ways of talking. Fourth, do not be afraid to practice talking. Try to say something, even when there does not seem to be very much to say.

To learn to express oneself well requires some time and practice. It is an art and like any other art, requires its sacrifices. Take the art of painting or of music, for example. Those fine arts are not to be attained by the crowd. Not even the just criticism of these arts is attainable without a great deal of natural gift. It takes a lifetime of devoted work to become superior in any of these arts. It takes constant practice, constant denial, and constant work. Many times it means the sacrifice of home life. But anyone wishing to succeed must be willing to sacrifice other things for the sake of her art.

Not so long ago books were not as cheap as they are now, and not so many people were able to read. Then more attention was given to being agreeable in conversation. Now we have become so busy that we no longer consider ourselves responsible for the flow of good conversation in our homes, at our tables, and in company with other folks. Still there is no other accomplishment that gives as much pleasure to our friends as good conversation and no other art can be so constantly or so effectively used. It has also been said that no other art is so praised by our fellows, and that people who fail in it are punished more or less by the dislike of their fellows.

If you really wish to improve yourself along this line you will not hesitate to spend a few moments at practice. You could do this by taking about five minutes each day to read some little short sketch and repeating it to yourself a great many times until you have almost memorized it. In that way you will soon get in the habit of remembering and also of using new words that you have not been using before. It will give you confidence and you will feel that you know what you are talking about when you are talking.

If you find it hard to remember, or to say what you want to say, then try writing it down. Write only short sentences. Write about the things you know best and write a little every day. Have definite subjects in mind when you are trying yourself out.

If you can spend only five minutes on yourself each day, do not be stingy with yourself, but give the whole of the five to the work you have in hand. Think hard about what you are reading. Think just as hard about your subject while you are writing. Do not try to read and remember everything in sight, but be sure that you have learned a little thoroughly.

With these hints and constant practice at home and when you are out, your conversation should soon show signs of improvement. And now we hope that no man with a talkative wife will get hold of this article, because if one should, he would wonder why such an article would ever be necessary.—SOPHIA K. ORMOND.

The All-too-common Cold

I was sniffling around the other day with a cold and wailing as I always do on such occasions, "Why don't the doctors do something for colds?"

Some one who heard me, spoke up and said (I think he must be a dyspeptic): "Good enough reason. It's the thing they can make the most money on with the least effort. The people of this country spend millions and millions of dollars every year trying to get their colds cured. You just know the doctors are not going to kill the goose that lays their golden egg."

There may be a few doctors like that but I feel sure that most of them do the best they know, for if they knew any way to cure colds quickly or avoid them entirely, they would not go about suffering from them themselves. I do not doubt that if as much time were spent investigating colds as is spent on cancer, for instance, we would surely have a solution for the problem but it will come in time.

There is no doubt that the average person looks on colds very differently from what he did ten or even five years ago. Their great menace lies not in the discomfort they bring, but in the consequences that are likely to follow. Getting all the people out of the attitude that "it's just a cold" is a long process but I think many of us will live to see the time when people with colds will no more go out and spread them around than they would a highly contagious disease.

Early fall is the season for the beginning of colds and they are on the increase right up through February. Hundreds of pneumonia deaths would be avoided yearly if people were not so low in vitality due to colds. I am not sure that we can all prevent ourselves taking cold but I think we know the signs well enough so that by doing the thing we know we should do, we can keep it from getting a real hold.

The medicine prescribed by the best doctors is a bitter pill to swallow for most of us; that is, stay in bed. Lying in bed when you have nothing but a slight sniffle and a feeling of being tired may seem a bit lazy but I have seen its wisdom proven again and again.

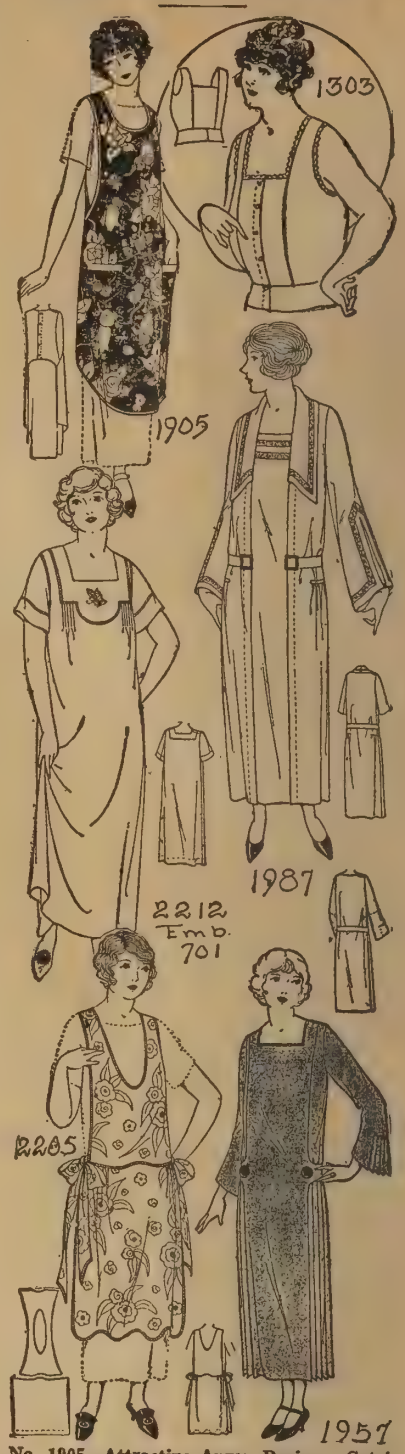
A day or two in bed, quantities of water, and not much food and the patient in nearly every case gets up better than he has been before. But let him decide to brazen it through and go about his usual work and he ends by dragging about for two weeks or so, miserable and inefficient. The logic of it is that the body needs all its energy to fight the cold and has none to spare for work.

Some of the big business houses in this country found out that most of the absenteeism on the part of their employees was due to colds. Their doctors have adopted the policy of having the patient stay in bed for a time and the result is that the absences from work are greatly reduced.

Big companies do not do that because they feel sorry for their workers; they do it because they find at the end of the year that they have saved money on it. I think that if we could check up, we would find the same thing.—LUCY THOMPSON.

Farm women spend a third of their waking hours in preparing and serving meals, a Missouri survey of farm household records shows.

A directory card with the more important numbers on it hanging handily by the telephone is a geat convenience. Have you one in your home?



Talking is like playing on the harp; there is as much in laying the hands on the strings to stop their vibrations as in twanging them to bring out their music.—Holmes.

Blake—"Did your wife hear you when you came home late last night?"

Briggs—"Did she? Why, man, she wakes up when the thermometer falls."

Aunt Ada's Axioms: The home is sometimes known by the "company" is doesn't keep.

Miscellaneous Fashions

No. 1905—Attractive Apron Design. Cut in sizes 36, 40, 44, and 48 inches bust measure. Size 36 takes 1½ yards 36-inch material.

No. 1303—Slenderizing Corset Cover. Cut in sizes 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 takes ⅞ yard 36-inch material.

No. 2212—Dainty Nightgown. Cut in sizes 16 years, 36, 40, and 44 inches bust measure. Size 36 requires 3¾ yards 36-inch material. Hot-iron transfer pattern No. 701 (blue only) costs 15c extra.

No. 1987—Slenderizing Lines. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3⅞ yards 40-inch material.

No. 2205—Attractive Apron. Cut in sizes small, medium and large. The medium size takes 2¾ yards 36-inch material.

No. 1957—Smart Daytime Model. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 takes 3⅞ yards 40-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Some More Single Tax

HOARD'S DAIRYMAN:—Mr. R. W. Steed's letter proves that he has not taken the trouble to inform himself about single tax; either that, or he is guilty of deliberate misstatements.

The single tax is strictly a plan or method to solve that age-old problem of "who owns the land". It holds that land is a natural gift, or medium of wealth production, for whose existence man is not, nor can he be, responsible and therefore is common property. That no man has a right to exclusive possession of any of the valuable portions of it except he pay the value of it back to his fellow men.

The single tax, denying the right of men to "own" land as that word is generally understood, it still recognizes the justice, the wisdom, and economic necessity of exclusive private possession, and its plan is to take, for collective benefit, its annual rent.

The first mentioned variety of land would yield no rent. Farmers on the second variety, along with lumbermen and miners, would pay in rent according to the degree of fertility, timber, or mineral richness and accessibility to market the land possesses.

If "small towns" grow up in these districts with stores and other conveniences and diversions the rent of the land will be higher, in some instances much higher, than the rent of farm land.

It is when we come to the last variety that startling results are seen. For an acre of sterile land in some communities, men will gladly pay more in annual rent than for thousands of acres of even good fertile land. This extraordinary rent value is due to the numbers of people desiring to live and produce on that particular land. If, for instance, one-half of the people in the state of New York would move to the state of Washington, the rent of land there would rise much higher than it is now, while a decrease in rent value would take place in New York.

I have stated the single tax position; I would like every one to take up its study, and if mind and conscience approve, to come out and help those of us who are fighting its battles, but if there are men, like Mr. Steed, whose mind and conscience see in it an immoral proposition, it is their right, in fact their sacred duty, to oppose it. This does not give them the right, however, to make deliberate false statements regarding its aim and purpose. Single tax is not contrary to our fundamental law, but is based on one of the oldest fundamental laws, namely, "God made the land and gave it to all His children". It will not take, but will lay, the foundation of homes by making homes much cheaper and easier to acquire—through abolishing the first cost of sites to so-called owners, and all taxes after the homes are built.

Mr. Steed regrets that men of great wealth are not taxed (robbed) enough and "would, under single tax, not pay one-tenth the tax they do now", and the burden of taxation "would be laid on the laborers and farmers' homes. The poor hovel would pay the same tax as the mansion next door, even though the latter's income was a million dollars to the farmer's one."

These conclusions are so ponderously stupid and so manifestly untruthful, that they give a basis for my suspcion that Mr. Steed is "spoofiing". If they were within a thousand miles of the truth, the treasury of the commonwealth land party (now so pitifully empty) would soon be filled with the voluntary contributions of men of great wealth.

Maryland. OLIVER MCKNIGHT.

Advises Going Among the Working Class

HOARD'S DAIRYMAN:—In reply to R. D., who it appears, is afraid to sign his name, I will say I got my information from the teacher who made a personal canvass of many houses and found that the parents did not have enough income to feed their children properly, and that many went to school with but a scant breakfast and some with none at all. I have myself taken food to more than one workman's house to feed their hungry family and those men ready to work if it could be had.

You go down to the factory gates every morning and see the untold numbers wanting work, and you will find the few getting the wages Mr. R. D. speaks about. It's a fact a few are getting the wages he mentions but it's few and that for only a portion of the year; take the carpenter, brick mason, in fact all of us in the building trades. Take the recent report from the saw makers, the workmen are getting less than one-third of what wealth they produce; that is, if his labor power produced $100, he got less than $33, the difference is what has made our multi-millionaires. Is it just? How did Harriman make or get his millions, and the rest of the railroad magnates, if it was not taking too much toll. It is true we can trace all of our troubles back to the want of knowledge. The South does not produce as they should and take care of it.

When Mr. R. D. says men do not have enough to feed their families he does not know what he is talking about. Some years ago I managed a large farm and was allowed to pay but $13 a month to a married man. He got a shack and firewood but had to cut it after doing his day's work. How those men lived on it I do not know. I turned much to them to help them out. If Mr. R. D. will get out among the working class he will learn something different.

Wisconsin. JAS. H. BIRCHARD.

No Profit Guaranteed to Railroads

HOARD'S DAIRYMAN:—I notice in your issue of August 22nd, page 130, a very thoughtful contribution signed Howard Kimble, Minnesota. In the fourth paragraph of this letter, Mr. Kimble says, "our railroads have been guaranteed a profit, etc."

Hoard's Dairyman has uniformly been so careful about printing the truth and so courteous about correcting mistakes that I am quite certain you will permit me to show Mr. Kimble, if I can, that he is in error respecting this so-called guarantee. I shall try to be very brief. So much has been said on this question of an alleged guarantee that it might seem unnecessary to say any more, but here is an intelligent writer making the same old charge in your paper. Even the most rabid railroad baiters have ceased to declare any longer that there is a guarantee.

Let me quote to you the rate-making section—this is Section 15a, paragraph 2—"In the exercise of its power to prescribe just and reasonable rates, the commission shall initiate, modify, establish, or adjust such rates, so that carriers as a whole * * * will, under honest, efficient, and economical management and reasonable expenditures for maintenance of way, structures, and equipment, earn an aggregate annual net railway operating income equal as nearly as may be, to a fair return upon the *aggregate value* of the railway property of such carriers held for and used in the service of transportation * * * * *.

"The commission shall from time to time determine and make public what percentages of such aggregate property value constitutes a fair return thereon. * * * * In making such a determination, *it shall give due consideration, among other things, to the transportation needs of the country and the necessity of enlarging such facilities in order to provide the people of the United States with adequate transportation.*"

You will see, reading the words in italics, that the only guarantee here is that in making these rates, and in determining what shall be a fair return, the commission must see to it that the country has adequate transportation facilities.

The law provided that for two years, a period which ended March 1, 1922, this fair return should be 5½% to 6% as the final limit. At the end of that time the commission named 5¾% as a fair return.

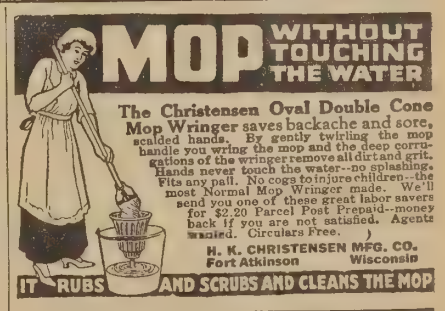
Since this law (The Transportation Act of 1920) became operative, the railroads as a whole have not in any year earned the fair return to which the commission said they would be entitled. Indeed, they have failed by much more than a billion dollars to earn that fair return. Does anyone who understands the word "guarantee" suppose that if this act really held such an assurance against loss that the railroads would not have collected this billion dollars or more? And if they had attempted to collect it, would not the so-called friends of the farmers have risen in their wrath to prevent it?

I have told you the exact truth about this guarantee matter because in many ways it is the most misunderstood and the most objectionable feature in all the misrepresentations that have been circulated against our railroads.

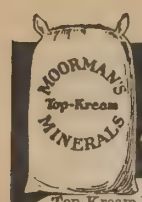
Illinois. CHARLES DILLON

Better than aching backs

The first labor-saver that the woman of the family wants when the farm home is electrified is a washing machine; it banishes "blue Monday" by substituting electric power for her back-power.



Then comes the electric iron—and after that the man of the family can decide where he needs electric power to take the load off his shoulders.



Electric light and power on the farm is an investment in better and happier living.

One of the most useful services performed by General Electric Company is the manufacture of little motors to operate the appliances that take the drudgery out of housework and farm work.

The new G-E Farm Book, giving interesting facts on the subject of farm electrification, will be sent on request. Write Section E, General Electric Company, Schenectady, N. Y., Chicago, Ill., or San Francisco, Cal.

GENERAL ELECTRIC

FREE *this* BAG *of* Top-Kream Minerals

Science has produced Moorman's Top-Kream Minerals—a thoroughly tested mineral feed for dairy cows—a splendid appetizer. **Produces Larger Profits—Better Calves—Less Abortion—in many cases More Milk.** Phillip Thenis, of Illinois, fed 500 pounds—it stopped abortion—increased the milk flow. E. J. Koehnle, of Iowa, got increased milk gains from 1 to 3 pounds per cow per day. Few realize it but their cows are mineral starved. Now is the time to stop these losses. Top-Kream Minerals will do it.

Get a Bag FREE

Test it yourself. To advertise this wonderful product—to give every dairyman the benefit of knowing about it, we'll send a sample bag, Free—no obligation ——enough to feed 24 cows. Feed it yourself—let your cows be the judge. You'll find they like it.

Don't Wait—Accept Now

Clip and mail the coupon today. Try Moorman's Top-Kream Minerals and profit by their benefits. Act now! The bag is Free—no obligation.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets developed a somewhat unsettled feeling during the week ending Oct. 18th. Slight reaction following previous week's declines did not stimulate active business. There appears to be a tendency toward an increase in storage surplus since the first of the month as a result of slow business. This, together with heavy fall production and the influence of an unsettled butter market, offered little basis for confidence.

The average wholesale prices on American cheese, style Twins, for the week ending Oct. 18, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Oct. 18 1924	Oct. 11 1924	Oct. 18 1923
	Cts.	Cts.	Cts.
New York	20.0	20.5	25.7
Chicago	18.8	18.9	24.0
Boston	21.3	21.5	27.3
San Francisco	19.2	19.2	26.9
Wisconsin Boards	18.6	19.2	23.4

The receipts of cheese at these markets were 2,869,947 lbs. for the week as compared with 4,883,340 lbs. last week and 4,782,945 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets steadied somewhat on top grades during the week ending October 18 but were generally unsettled as the week progressed with weakness apparent at the close. Storage situation continued to be an important influence, production holding up remarkably well. Foreign markets were firm but exports light.

The average wholesale prices on 92-score butter for the week ending Oct. 18, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Oct. 18 1924	Oct. 11 1924	Oct. 18 1923
	Cts.	Cts.	Cts.
New York	39.0	38.5	48.0
Chicago	37.5	37.5	47.2
Philadelphia	39.5	39.4	48.8
Boston	38.8	38.3	48.0
San Francisco	39.1	39.7	47.9

The receipts of butter at these markets were 9,637,896 lbs. for the week as compared with 13,481,952 lbs. for last week and 11,091,281 lbs. a year ago.

MILWAUKEE, Oct. 25—Creamery extra, tubs, 36½c; standards, 34c; extra firsts, 33@33½c; firsts, 31@32c; seconds, 29@30c.

Eggs—Fresh gathered firsts (new cases), including cases, candled, 46@47c; ordinary, first standard cases), 44@45c; miscellaneous lots, shippers' cases returned, candled, 41@43c; seconds, dirties, 29@30c; checks, 20@28c.

Cheese—American full cream, Twins, 18½@19c; Young Americas, 19@19½c; Longhorns, 20@20½c; Daisies, single, 19@19½c; squares, 19½@20c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

CHICAGO, Oct. 27—(A. P.)—The butter market today traded quiet with prices unchanged, ruled steady to firm on the top grades. The lower scores were no more than steady and were freely offered. Buyers, while showing some interest, were very critical as to quality. Some inquiry reported in 88- and 89-score cars, but little business developed. Supplies of centralized cars were light, but ample to meet requirements. Fresh butter—92-score, 37c; 91-score, 36c; 90-score, 34½c; 89 score, 32c; 88-score, 29c; 86-score, 28c. Centralized car lots—90-score, 34¼c; 89-score, 32c; 88-score, 30c.

FOND DU LAC, Wis., Oct. 24—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 18½c; single Daisies, 18¼c; double Daisies, 18c; Young Americas, 18½c; Longhorns, 18¾c; square prints, 19¾c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Oct. 25: Single Daisies, 17c. On Farmers' Call Board, Oct. 24: Young Americas, 16½c; Longhorns, 17¼c; square prints, 18½c.

NEW YORK, Oct. 27—Butter—Firm; receipts, 6,702 tubs; fresh supply, 63,424 tubs; creamery extras, 38½c; specials, 39½c.

Eggs—Firm; receipts, 5,039 cases; fresh supply, 84,357 cases; white, fancy, 81@84c; fresh firsts, 43@47c; western whites, 38@80c.

Cherub Guernseys

FOR SALE, CIRCLE J. CHERUB'S SENSATION undefeated Sr. bull calf and junior champion at 4 leading Vt. fairs 1924. Sired by a son of Imp. Hayes Cherub II. Out of a prize winning A. R. daughter of Pencoyd's Golden Secret. Also 5 heifer calves of similar breeding, nicely marked. Priced to sell. Accredited herd.

HUBBARD BROS. St. Albans, Vt.

Twin City September Milk

The Twin City Milk Producers' Association paid $2.20 for 3.5% milk in September. Out of a total of 17,803,970 lbs. milk handled, 65% was sold to distributors. The expense of operation totaled 24 cents per hundred pounds milk. The association paid 40 cents a pound for fat in first grade cream.

League Price for September

The New York Dairymen's League Co-operative Association announces that its gross pool price for September for 3 per cent milk at the 201-210 mile freight zone is $1.93 per 100 lbs., or 21 cents more than for August. Deductions for expenses in September amounted to 8.5 cents, making the net pool price $1.845. Deductions for certificates of indebtedness amounted to 10 cents and the cash distribution is $1.745.

Guernsey Guests at Schwab Estate

Attended by some 80 members, their wives and friends, the annual fall meeting of the Central Pennsylvania Guernsey Breeders' Association was held Oct. 13th, at "Immergrun", summer home of Mr. and Mrs. Chas. M. Schwab. Blair, Bedford, Cambria, Huntingdon, Mifflin, Centre, Indiana, Somerset, and Westmoreland counties were represented.

M. T. Phillips, of Chester County, was the keynote speaker. Mr. Phillips, starting with virtually nothing, today is both a business man and an extensive breeder of Guernsey cattle in his home county. From his large herd have come many champion Guernseys.

"Any farmer," he told his audience, "has a chance to buy or breed champion cattle. But it is necessary for every big dairyman to have his herd tested for production and to use these records in building up his stock. Breeding is simply the improving of production of animals."

He spoke of the necessity of efficiency in his whole farming business and said that to realize a comfortable income the dairyman must take into account efficiency in production, marketing, and management.

Much interest was manifested in the report of N. C. Shane, cow tester for the association, who told of the 8 months of testing, beginning last February. During the months of August and September, Shane was given an assistant to aid in fostering Guernsey exhibits at the county fairs in Blair, Mixin, Huntingdon, Centre, and Cambria Counties.

Clochette's Dimple, a Jersey that is owned and was tested by Neil Elder of Ohio, has completed a very creditable 305-day official test, and has succeeded in winning both a gold and a silver medal.

Dimple started on this test when four years and eight months of age and in 305 days she produced, with calf, 626.03 pounds fat and 11,633 pounds milk.—American Jersey Cattle Club.

World's Largest Guernsey Sale!

— Will be Held at

WEST SALEM, WIS., NOV. 19-20

300 Head **Choice Registered Guernsey Cows, Heifers and Bulls** **300 Head**

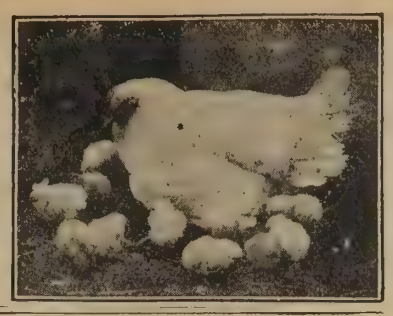
May Roses, Chenes, Cherubs, Glenwoods and Sequels

consigned by the leading breeders of Guernseys of thirty counties in Western Wisconsin. Every animal selected by a sale committee appointed to secure only the best.

The Greatest Opportunity You Ever Had to Secure One Animal or a Carload!

There will be 100 head of cows, 3 to 8 years old.
120 head yearlings and two-year-old heifers.
50 heifer calves eight mos. to one year.
30 bulls one to six years old.

Many of these animals have large advance registry records. Many were leading prize winners on show circuit this season.



Sale held under the auspices of

Western Wis. Guernsey Breeders' Sales Ass'n

Address all inquiries for catalogs to

POULTRY On The DAIRY FARM

O. A. HANKE

A Call for the Molters

A long year of production is a heavy drain on the system of the laying hen. The manner in which they get through the molt determines in a measure the following year's production. Feed the late molter well. She is the most valuable hen of the lot. Help her rebuild her body and replace her old feathers with new ones and she will get off quickly to another year's production.

Just as the finishing period of the pullet determines her year's lay, the feeding of that pullet during her yearling molt determines her production during the second year's production. In those flocks which have been culled once or more during the summer, the hens which still remain in the flock should be retained for the second year's lay.

Feeding the Molters

The molting period requires feeding for several purposes. The ration should contain protein for feather-building, fat for body building, and other elements, principally minerals, for replacement in the body. The following ration is very satisfactory during the molting period: 150 lbs. corn meal, 100 lbs. wheat bran, 100 lbs. wheat middlings, 100 lbs. ground oats, 100 lbs. meat scrap, 20 lbs. oil meal, 20 lbs. bone meal, 3 lbs. salt.

Skimmilk is good for both molters and laying hens and where there is a supply the hens should be given all they will consume.

The corn meal serves as a source of fat. It is quite necessary that the molting hen gets in a good condition before she begins to lay. The meat scrap supplies the hen with protein for the building of the feathers and for the reconstruction of muscles and body tissue. The bone meal supplies the calcium and phosphorus for the bones and muscles. The following whole grains should be fed with this mash mixture: Three parts by weight of whole corn and one part by weight of oats.

The farmer should feed the hens corn as soon as it is available this fall. If corn is not available the corn in the mash mixture may be replaced by an equal part of ground barley and the corn in the scratch may be replaced by throwing corn on the cob to them.

Poultry House Fixtures

It will be well to feed the mash in some form of open hopper in the poultry house. The hens will be protected from the chilly winds and will thus eat more feed. Keep a layer of straw on the poultry house floor and the hens will be more comfortable.

This is a good time to give the house a thorough cleaning. Hens which are infected with lice and have mites feeding on them, do not molt quickly. Clean the house thoroughly and then disinfect. A mixture of three parts kerosene and one part crude carbolic acid will prove to be a very good, home-made, cheap disinfectant.

Thoroughly soak the roosts with this mixture and then whitewash the house if time enough is available. There are a great many efficient, easily mixed whitewash sprays. The following mixture is easily made, sticks well, and has disinfecting properties: One-half bag hydrated lime, 6 lbs. common table salt, 1 pint molasses, 3 ozs. ground alum, 10 gals. hot water, 1 qt. disinfectant.

This work should be done early in the morning so that it will be dry by night. This whitewash may be put on with a brush or with a barrel spray outfit and twenty to thirty feet of hose. The spray method is best for then the whitewash is forced into the cracks and crevices in which the mites live.

Winter Eggs from the Molters

Hens which molt late will complete their molt in four to six weeks if fed and cared for as suggested. Many of these hens will be ready to lay in December and will help to fill the egg basket during the latter part of the season of highest prices. The better hens will drop all of the feathers quickly and will appear about the farmstead almost naked. Those hens are worth their weight in gold. Guard them and care for them as you would gold and they will form a valuable asset to the poultry flock for their second year of production.

What a Little More Butter and Egg Consumption on the Farm Would Do

Take Butter, for example —

The per capita consumption in the United States is only 17 pounds per year, whereas it is over 25 pounds in Canada.

This year the holdings of butter in cold storage houses are about 54 million pounds more than a year ago and, besides, the daily make has been very heavy right along.

Pastures have been so good that unusual quantities of cream have been received, and the creameries must of course take what is offered and manufacture it into butter.

The result is an unusual production this year.

How can you farmers assist in absorbing this heavy yield? Simply by *eating more butter in your own homes.*

Think what a wonderful stabilizer for the price of butterfat it would be if every farm home consumed a few pounds of butter more per year! It would increase consumption by millions of pounds and each producer would benefit from it.

The Chicago Mercantile Exchange—the great wholesale market dealing in butter and eggs for both immediate and future delivery—is helping to stimulate butter consumption this year. You as producers can help, too, by following the above suggestion.

Chicago Mercantile Exchange

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

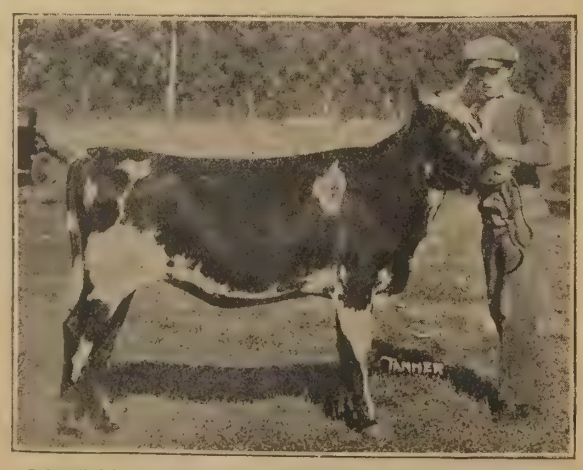
Iowa Dairy Juniors at Waterloo

FRED E. FERGUSON

OH, boy! Were you one of the lucky fellows who attended Dairy Cattle Congress, located at Waterloo in the "Tall Corn State"—Iowa—Wednesday, September 24? "Club Day" smashed all former attendance records in the fifteen years the show has been held and there was a mighty significant reason—the dairy juniors of Iowa put it over the top.

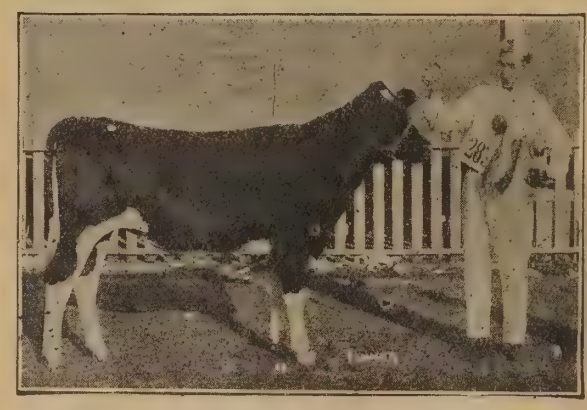
The first club program for dairy juniors was held in 1922 when 47 boys and girls showed their calves representing two breeds, and the junior dairy cattle judging contest drew 15 boys. Last year there were 76 boys and girls who showed calves of three breeds and 52 boys and girls were in the junior judging contest, with an added feature of two demonstration teams contesting. This year there were 129 boys and girls who showed their dairy club heifers, in which all five of the dairy breeds were represented; there were 21 teams of three boys and girls each in the judging contest and enough individual entrants to bring the total contestants up to 87. This year there were four demonstration teams that competed for the championship of the state and the right to represent Iowa at the National Dairy Exposition in Milwaukee.

WEBSTER COUNTY FIRST PRIZE COUNTY HOLSTEIN GROUP
Left to right: Verna and Robert Peterson, Paul Jacobson, Donald and Gerald Peterson. Almost a family proposition, don't you think?



The junior program opened on Monday, September 22, the first day of the Congress, with the judging contest. One class of cows of the Holstein, Brown Swiss, Jersey, and Ayrshire breeds was placed and one class of Guernsey heifers. Judge Burt Oderkirk, Iowa State College, gave Franklin County a total team score of 992, the highest of the 21 teams. Robert Stewart, Fayette County, made the highest score on all breeds and received the gold medal given by Dairy Cattle Congress. The other medal winners were: Second, Harlan Leonard, Franklin County; Gertrude Kaiser, Clayton County, third. The winning team composed of Lester Olson, Raymond Monahan, and Harlan Leonard won highest honors for Iowa at the National Dairy Exposition. The Brown Swiss Breeders' Association, the Iowa Holstein Breeders' Association, and the Iowa State Dairy Association contributed expense money.

The four demonstration teams competed on Tuesday. P. C. Taff, state club leader of Iowa, judged the demonstrations and he selected Black Hawk team, composed of Richard Sucher, Guernsey club member of Cedar Falls, and Helen Cunningham, Holstein club member of Waterloo as the winner. They demonstrated the selection of dairy cows by indications of type and followed with testing a sample of milk which lead up to a discussion of cow testing association work. This team won first at the State Fair in Des Moines last August in the class for miscellaneous teams and was a close contender for champion team. The members were coached by their club leader, R. C. Munkwitz.



The judging of the 129 club calves began promptly at noon, Wednesday.

Both Professor Kildee and L. V. Wilson worked on the classes of Holsteins. Earl J. Cooper, national Holstein club leader, declared the class of yearling Holstein club heifers was the greatest he had ever seen at any show. Gerald Peterson emerged the winner. Gerald is a brother of Verna Peterson who last year had the champion Holstein club heifer. Verna this year stood third in the class, while her brother, Donald, was fourth and her brother, Robert, fifth. The calves owned by the four Petersons and the yearling owned by Paul Jacobson composed the county group which later won first among the thirteen and won the silver loving cup offered by Iowa Holstein Breeders' Association.

There were 58 boys and girls who showed Holstein calves born since Aug. 1, 1923. Robert Stewart, winner of the individual honors for junior judging, was selected winner in this great class. Robert later defeated Gerald Peterson for grand champion Holstein club heifer.

LOUIS M. FROST, CHAMPION AYRSHIRE SHOWMAN
His heifer, Redwing of City View, was likewise a champion.

JOHN WILCOX, CHAMPION CLUB SHOWMAN OF IOWA—ALSO CHAMPION HOLSTEIN SHOWMAN

There were 78 Holsteins in the club show this year; 24 Guernseys, 15 Jerseys, and 6 each of Brown Swiss and Ayrshires. These were very comfortably housed in the brand new hollow tile barn, which all agreed was far better than the tent of a year ago. Most of the counties are planning to be back next year stronger than ever.

One of the features on Wednesday was the fitting and showing contest. J. C. Cort, Lake Mills, Wis., and Harry Cave, Manhattan, Kans., acted as judges of this contest. They worked at the same time as the regular calf judges.

Dairy Calf Club Awards

Judges: H. H. Kildee, Ames; L. V. Wilson, Minnesota; Harry Cave, Kansas; Joe Cort, Wisconsin.

Ayrshires

Heifer born since August 1, 1923 (5 shown): 1 and grand champion—Louis M. Frost on Redwing of City View; 2, Vera Spies on Vivian of City View; 3, Floyd Spies on City View Hortense.

Champion Ayrshire showman: Louis Frost, Waterloo, Ia.

Holsteins

Yearling heifers (23 shown): 1, Gerald Peterson on Riverdale Ota Van Friesland 2d; 2, Dorothy Hanson on Fannie Macduff Janzen; 3, Verna Peterson on Pauline Champion Hartog.

Heifers (59 shown): 1, Robert Stewart; 2, Waldo Albrecht on Lady Verma Segis; 3, Myrna Pieplow.

Champion Holstein and grand champion showman: John Wilcox.

Brown Swiss

Yearling heifers: 1, Emil Thoms.

Heifers (5 shown): 1, Margaret Mooney on Schonnette; 2, Albert Keskje on Madam Merry Boy of Allynhurst; 3, Ivan Thelander on Elsie M. of Elmhurst.

Guernseys

Yearling heifers (3 shown): 1, Helen Lee; 2, Harold Bauer on Anderson's Rose; 3, Robert Lee.

Heifers (21 shown): 1, Marple Mountain on Cherub's Beautona of Iowanola; 2, Erwin Orth; 3, Wm. Schmidt.

Grand champion Guernsey heifer, Marple Mountain.

Champion Guernsey showman: Harold Bauer.

Jerseys

Yearling heifers (12 shown): 1, Donald Hansaker on Proud Lad's Fairy; 2, Merle Stroud on Western Oxford Viola; 3, Mary Way on April Shower's Championess.

Heifers (4 shown): 1, Ralph Nesfiled on You'll Do Mary Jane; 2, Havard Hedrick on Lady's Silverine Velvet; 3, Lorenze Strottman on Financial Naiad's Pet.

Philosopher Phil Says

When you are headed for a good time, would you walk back three miles to see that your calf is properly taken care of? Once a calf club member did this very thing. He was going away for the day to have a good time. Before he left he remembered that his calf should be fed, so he went to his father and asked him to feed his calf when the hour arrived. His father consented.

Thinking his duty performed, the boy started off afoot for his destination several miles away. He had gone, perhaps three miles from home, when he suddenly remembered that he forgot to tell his father what and how much to feed his calf. He pondered a moment, but only a moment, and then turned square around and walked back those three miles that his calf might be properly fed.

This, boys and girls, is loyalty. If you would do the same under like circumstances, then you are a true Hoard's Dairyman Junior.

In Memoriam

The club boys of Virginia were saddened at the untimely death of their state boys' club leader, Charles G. Burr, on Saturday, September 20. He was killed in a street car accident in the city of Petersburg.

A friend of farm boys; a lover of farm boys; and a servant of farm boys has departed. But we bow to the will of our Heavenly Father, Who knows what is best.—The Carolina Club Boy.

Ten-year-old Champions

What do you know about it?

Three ten-year-old calf club girls won the championship of the three principal dairy breeds at the Minnesota State Fair this year. Nearly 2,000 Minnesota boys and girls enrolled in dairy calf clubs this year and 172 calves were shown in the boys' and girls' show at the fair under the direction of E. A. Erickson, State Club Leader.

EVELYN LEINENWEBER OWNS A CHAMPION

Evelyn Leinenweber was one of the ten-year-old girls and she not only had the champion pure-bred Holstein calf, but also had the grand champion over all breeds. Here is what Evelyn says about how she cared for her calf:

"Sizerholm Sadie Vale Homestead was born November 13, 1923. She is a nice, gentle calf, and I fed her three times a day equal parts of ground oats, corn, and bran, and one part oil meal, about two pounds to a feeding, with all the clover hay, salt, and clean drinking water she

wanted. I brushed her every day and washed her once a week. I lead her around every day and make her stand still and hold her head up so as to train her to show to the best advantage for the fair."

Evelyn owns two other heifers, one a grade Holstein, and with the increase and products of her little herd expects to pay her way through the School of Agriculture at University Farm (Minnesota) which she plans to enter, she says, just as soon as she has finished the eighth grade.

New York State Juniors

A recent report from New York State says that for the year 1924 there was a total of 15,475 boys and girls enrolled in junior extension work. This is an increase of nearly two thousand juniors over last year. Forty-five of the fifty-six agricultural counties in the state were represented in this figure.

Clothing proved to be the most popular project, followed by gardening, poultry, food, potato, dairy, canning, corn, pigs, and sheep.

W. H. Wright is the New York State Club Leader.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

In the October issue of Hoard's Dairyman you will find a further discussion of the following:

Give Reverend Everett S. Smith's prescription for the best health medicines. Air, sunlight, water, and diet.

Tell about the service of the Milwaukee Milk Producers' Association. It is estimated that the price of the market milk so far this year has been about forty cents a hundred higher than it would have been without this co-operative marketing association. G. R. Rice is the Secretary-Manager.

What is the net income of F. A. Chester? From $4,500 to $6,900 yearly in the past four years.

Why did he go farming? Fifteen years ago Mr. Chester was a business man in Illinois. He thought he saw greater opportunties in farming, as this would give him a healthier life and his four boys and two girls the best place in the world to be reared. He purchased a two-hundred-acre farm in Iowa and moved onto it.

What Made him successful? Application of business principles to dairy farm work. He started right away to find out which of his cows produced a profit and which did not. That was in 1911. Later when opportunity presented itself, he joined a cow testing association. His success may be partly measured by the fact that his three sons, having passed the age of 21, are all actively interested in the business.

How does Mrs. Chester care for her chickens? Last year chickens brought the Chester family a net profit of $532.50. "My chickens get sour milk the year around; they get oats in the morning and have a dry mash consisting of ground oats, ground corn, bran, tankage, flour middlings, and salt in front of them all the time. I gather the eggs promptly every day and cull the poor chickens during the summer," says Mrs. Chester.

Discuss two versus three milkings a day. An experiment has been under way at the New York Experiment Station in the past two years to determine whether or not it pays to milk a cow three times a day. Mr. Dahlberg finds that it is long period records that will be bettered by three milkings a day. Definite results have not been announced.

Can they grow alfalfa successfully in Georgia? Yes. The important needs for growing alfalfa seem to be lime and acid phosphate. Alfalfa is grown largely as a cash crop in Georgia. (See page 441.)

Junior Letters

A Junior Bronco Buster

Hoard's Dairyman Juniors:—I am 16 years old. Our ranch is about 12 miles from town. We have a section of land or 640 acres with plenty of range land around it. Near our place there are large red hills covered with shale and cedar trees. Last summer my sister and I went to these hills and climbed to the top. We could see for miles away over the "bad lands" and we could see the Yellowstone river which runs through the "bad lands" not far from us. We do not have to buy coal or wood here because we can get it ourselves. We have had several dry seasons here and many homesteads are deserted.

We are milking fifteen cows nows and feeding 12 calves. We also have 125 range stock. There is no calf or pig club here because there isn't enough pure-bred stock where I live. We have four sows and 23 little pigs. Last spring my father was sick and I had to put in 65 acres of corn which turned out to be good and I also raised 125 chickens but didn't have very good market for them, so this spring I am going to try to raise turkeys. I bought a gobbler and two hens.

I ride very much in the summer time and I am very familiar with horses. My sister and I have broken bad horses into good saddle horses. We have seven saddle horses of our own but one I like the best of all. He is pure white and I named him Bingo because he is so swift and quick.

A few years ago Bingo was the swiftest horse in the country but he is slowing down now because he is getting old. I am the only one that can ride him. He is very strange. I won first prize in the ladies' relay race at the county fair and got $25. I rode three horses, two of our own, and the other I borrowed.

My sister and I went to the bad lands last June and near a large coulee we saw six little puppy coyotes running to their den. Then next morning my father came with a shovel and dug only one out. The others got away during the night. I tried to tame it but one morning it got out of the box and got away. There are many coyotes and several wolves here. They do much damage to the range stock as we had about ten calves killed by them one summer. They are having now a government trapper here. He has captured several wolves and a den of wolf puppies and many coyotes.

I will close now by hoping to hear from some of the juniors. I will answer their letters. My address is Box 24, Ferry, Mont.

Cora Groot.

Out on the Great Plains

Hoard's Dairyman Juniors:—I am a boy 12 years old and in the 7th grade. I live three miles east of Winona, Kans., on a 320-acre farm. We have the Holstein breed of cattle. We are milking 9 at present but in a little while will be 13. We live out on the Great Plains and there is only one place on our farm that a cow can get that we can't see her from the house. The place is about 20 acres in size. One-half of the farm is pasture and on the other 160 acres we grow sorghum and small grains.

I have a cow that is a pure-bred Holstein and her name is Beauty Colantha Segis. She has raised me four bulls and last year (December 1922) she had a heifer calf for my Christmas present. I named the calf Beauty Colantha Segis 2nd. She dropped a heifer January 1, 1923, and has just dropped another heifer (January 20, 1924). This makes me one cow and two heifers.

Papa and I own 38 head of mules and 13 horses. We have a fair sized barn 48 feet square. We have it divided up in 16′ spaces the full length of the barn. The west side is for horses, the east for the cows, and the middle for hay, as we have no hay mow floor. The house is 14′x24′.

Lester Higgins.

How to Become a Junior

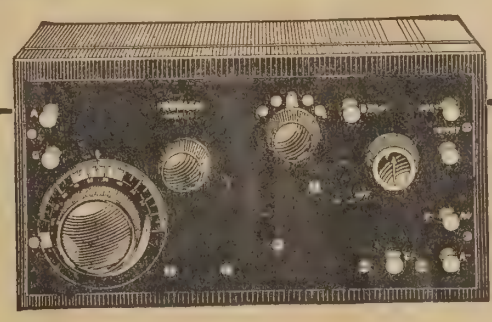
Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

A Radio Outfit

For Hoard's Dairyman Juniors



We figure that every Hoard's Dairyman Junior wants a Radio set. You do, don't you? I'll bet you do! There isn't any keener fun anywhere than sitting right in your own home and listening to concerts, speeches, etc., being given in the big cities. It's a wonderful thing, radio is. But just how wonderful, no one ever realizes until he has a set. You want one, of course!

Well, here's your chance to get one! And get one without spending a cent of your own money! All you need to do to earn this set is to go among your neighbors and get them to subscribe for Hoard's Dairyman.

How many subscriptions do you need to get it? Just send the coupon, and I'll tell you all about it! And I'll help you get it, too!

Send it today—and before many more days roll around you can be putting up this "Little Wonder" in your own home!

THE RADIO MAN,
Care Hoard's Dairyman.
Fort Atkinson, Wis.

This Two-tube Receiving Set

FREE To Hoard's Dairyman *Juniors!*

This set we offer our Juniors is the one that set the radio world afire! In just twenty-four days after being announced, this Crosley two-tube receiver became the most popular radio outfit in the world, so the manufacturer tells us. And I will tell the world it deserves its popularity. I've got one in my own home, and it brings in stations from coast to coast, regular as a clock and clear and sweet as a bell!

And you can enjoy this little wonder set—this winter. All the pleasures of radio can be yours, now, without spending one single cent of your own money!

For we will furnish this set to our Juniors complete, including the set, tubes, batteries, head phones, aerial wire—nothing more to buy; nothing to do except erect it—and with our instructions any Junior can hook it up in less than an hour. This set, complete as we offer it, would cost not less than $35.00 at your local store—but Hoard's Dairyman Juniors can get it without spending a cent. Send the coupon below and we will tell you how—and help you to get it.

COUPON

A. G. SEIBERLING, **Kokomo, Ind.**

Keeping up Fertility on Dairy Farms

(Continued from first page)

the end of the ten years, and in 1923 yielded only a few bushels of nubbins (corn). It would be difficult to find, anywhere, stronger argument in favor of lime and legumes as partners in soil improvement.

But manure and green manures will not always do all that is required towards keeping up the fertility. It is frequently profitable to reinforce these with commercial fertilizers. This is especially true in the case of truck crops and potatoes. Even in the case of hay and grain crops, one or two hundred pounds of a readily available nitrogenous fertilizer like nitrate of soda or sulphate of ammonia, or a few hundred pounds of a high grade complete fertilizer, will pay for itself several times over in increased yields.

Dairying tends toward intensive rather than extensive farming, and it is this as much as anything else that the American farmer must learn, if he would put a stop to declining yields.

Another Holstein Produces 1,000 lbs. Fat

Still another Holstein cow enters the ranks of 1000-lb. butterfat producers. The last one to qualify for this select circle is Yesletine Johanna Wit, bred and owned by A. F. Wendlandt & Son of Minnesota. As a 6-year-old cow she produced 31,936.3 lbs. milk containing 1,046.45 lbs. fat (1,308.06 lbs. butter) in 365 days.

"No other human occupation opens so wide a field for the profitable and agreeable combination of labor with cultivated thoughts, as agriculture. Every blade of grass is a study; and not grass alone, but soils, seeds, and seasons—hedges, ditches, and fences, draining, drouths, and irrigation—plowing, hoeing, and harrowing—reaping mowing and threshing—saving crops, pests of crops, diseases of crops, and wheat will prevent or cure them—implements, utensils, and machines, their relative merits, and to improve them—hogs, horses, and cattle—sheep, goats, and poultry—trees, shrubs, fruits, plants, and flowers—the thousand things of which these are specimens—each a world of study within itself."—ABRAHAM LINCOLN.

An Absolutely Clean Herd

SIR CALAMO WAYNE

SIR CALAMO WAYNE, a show son of Paul Calamo Korndyke, our senior sire, will be sold. His daughters are the dams of those good ones the Jefferson County Asylum has been showing.

We will also sell 6 of his daughters and 5 sons, all good ones. The entire herd is in calf to him. Sir Calamo Wayne is guaranteed right in every way.

The herd contains A. R. O. cows with records up to 24 lbs. in 7 days and 800 lbs. in a year. It has been tested since 1908 and we have never had a reactor.

Be there if you need a herd sire or some clean, straight, productive females.

Address: **THE SOPHIE TORMENTOR CLUB, SALEM, OHIO**

The Sophie Tormentor Club is an International organization with members in 29 states and Canada.

A High Point at the National Dairy Exposition

(Continued from page 472)

382 pounds of fat. The world's record Guernsey was present with a year's record of 17,555 pounds milk and 887 pounds fat.

The best grade Jersey cow produced in one year 7,116 pounds milk and 480 pounds fat. The seven grade Jerseys exhibited averaged 7,564 pounds milk and 424 pounds fat in one year.

The Connecting Link

Some might think this grade cow exhibit would detract from the exhibit of pure-breds at the Dairy Show, but only the short-sighted could entertain such an idea, for is not such an exhibit of fine and profitable grade cows the best proof of the high intrinsic value of *good* pure-breds? How could the value of good pure-bred cattle to the dairy industry of the country as a whole be shown in a more striking manner than by this exhibition, and especially by the nine grade Holsteins with such high production all from one pure-bred sire? It was only by grading up with pure-bred sires for four generations that this magnificent production was finally possible. Many good pure-bred sires are going begging when one of the greatest needs of the whole dairy industry is for their use in grading up and improving the offspring of 95 per cent of the 23,000,000 cows in the country.

These were the cows of real farmers, and they had made their records on common farms and under farm conditions where they were kept solely for the sale of milk. They demonstrated in a large way the practical value of grading up, the selection that can be obtained only by knowing the yearly records, and the result of improved feeding and care arranged by tester and dairyman.

This exhibit as it is developed from year to year should attract many thousands of the milk producers of the country who thus far have not attended the Dairy Show in anything like the numbers which they should. It is the connecting link between the pure-bred business and commercial dairying and carries the final and measured proof of practical improvement within the reach of all dairymen.

BROWN SWISS

SWISS VALLEY GIRL 7TH NO. 4678

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

Farmers and Electrical Engineers are putting their heads together

IT doesn't pay a farmer to carry a single bushel of wheat to the railroad station. He is a bulk producer. He must sell in bulk.

So it is with electricity.

A National Committee of economists and electrical and agricultural engineers has organized state groups of farmers to whom electricity is being supplied. These groups will receive electrical facts from engineers and will in turn give the engineers farming facts. The state agricultural colleges guide these groups—show them how to apply electricity and how to keep records of power consumed, time and labor,—records which can be compared with those obtained under non-electrical conditions.

Farmers do not profess to be electrical engineers, and electrical engineers do not profess to be farmers. But by putting their heads together they are adapting electricity to farming. Ways of utilizing electricity could be discovered that would be profitable.

Co-operation of this kind is now bringing about greater electrification.

As a result both the 500,000 farmers who have electric service and those who have never had it will profit. For electricity will be applied in ways never dreamed of before. Crops will be produced and handled with less labor and at lower cost. The standard of living on the farm will be raised.

All the conditions to be faced are not known. And as soon as they are known—and that will be very soon—there will be fewer farms on which men and animals do all the work.

The Committee in charge of the work is composed of economists and engineers representing the American Farm Bureau Federation, the Departments of Agriculture, the Interior and Commerce, the Power Farming Association of America, the American Society of Agricultural Engineers, and the National Electric Light Association.

A booklet has been published by the Committee. It will be sent on request free of charge. Read it and pass it on to your neighbor. Write for it either to Dr. E. A. White, American Farm Bureau Federation, 58 East Washington Street, Chicago, Ill., or to the National Electric Light Association, at 29 West 39th Street, New York City.

HOARD'S DAIRYMAN

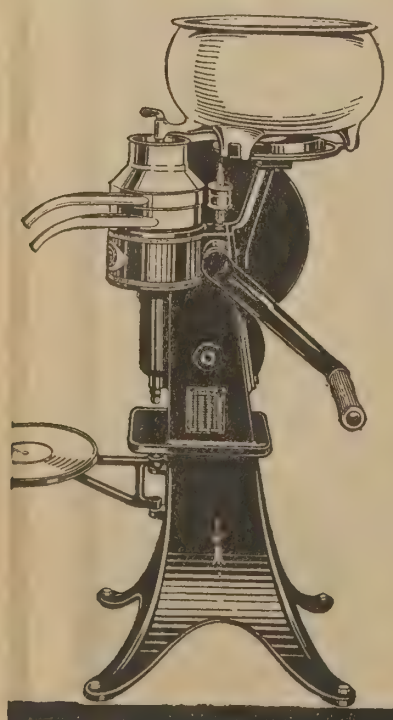
A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 17 Fort Atkinson, Wisconsin November 7, 1924

All Aboard! for the 1925 DeLaval Prosperity Special



For the past four years of depression, De Laval Cream Separators and milch cows have been the means of obtaining the most profitable, frequently the largest and certainly the steadiest cash money income on the farm. Now with better times returning, there is all the more reason for giving this end of your business careful attention. Good cows and De Laval Separators always pay and pay well—whether the times be good or bad.

Be sure that your cream separator is giving you all the butter-fat it should. And the best way to tell this is to try a new Improved De Laval. You may be pleasantly surprised at an immediate increase in the size of your cream check or amount of butter money. You will find the new De Laval the best cream separator ever made. It has the wonderful new self-centering bowl, which runs smoother, easier and without vibration.

The De Laval Milker. If you milk ten or more cows a De Laval Milker will soon pay for itself. More than 25,000 in use, giving wonderful satisfaction.

Liberal Trade Allowance

See your De Laval agent or write us about trading in your old separator (any age or make) as partial payment on a new Improved De Laval.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Entered at Fort Atkinson, Wis., as second class matter.

Copyright 1924. W. D. Hoard & Sons Co.
Volume LXVIII FORT ATKINSON, WIS., NOVEMBER 7, 1924 Number 17

FEEDING THE DAIRY CALF

CHARLES W. TURNER, MISSOURI

THE great importance of raising dairy calves from the best cows in the herd does not need to be discussed at length. Except under special conditions it costs less to raise heifers than it does to buy cows and the home-raised heifers generally develop into better and more profitable cows than most of those which can be purchased. There is much less danger from contagious diseases, such as tuberculosis and abortion, when calves are raised instead of being purchased from unknown sources.

From the standpoint of the pure-bred breeder, the sale of surplus stock is the chief source of income and the importance of developing this stock to the extent of its inherited capacity is of the utmost importance.

The large number of cows that must be raised annually to replace the old cows may be estimated from the data showing the annual turnover of cows in dairy herds given by Bain of the U. S. Dairy Division. He found that of 4,707 cows in the herds at the beginning of the year, 1,905 were sold for beef, died, or were condemned for tuberculosis. This would indicate that the average productive life of the dairy cow was only a little over 4 years. When those cows condemned because of tuberculosis were not considered, the life of a cow in a dairy herd was 5.7 years. If the 24,000,000 cows used for dairy purposes in the country average five years of service, each year 4,800,000 calves must be raised to maintain our herds.

As the heifers do not come into milk until about two years of age, about 9,600,000 unproductive animals must be on hand to replace the old cows. Some idea of the cost of these animals may be gained from the fact that it is estimated by the U. S. Dairy Division that four per cent of the total milk produced is used for calf feeding.

Fall or Spring Calves

Fall calves are ready to go on pasture the following spring and need little attention as long as the pasture is good. When the pasture dries up in the summer it is often necessary to feed some grain. Shade and water are two other items of importance in summer care. It is surprising how much water will be taken by young stock on pasture.

Spring calves cannot be placed on pasture the first year. They are generally weaned in the fall and must be carefully fed during the first winter if growth is to be at a normal rate. To obtain the most rapid growth, it is necessary to supply a considerable proportion of the nutrients in form of concentrates. Where roughage even though of the best quality, such as clover or alfalfa hay, is fed alone to growing dairy animals, the growth is certain to be much slower than where some grain is fed in addition.

At the Iowa Station McCandlish found that while winter calves were only four pounds heavier than the summer calves at birth, at the age of freshening the winter heifers had made the greater gains and on the average weighed 69 pounds more than the summer heifers at the same age.

Care of Dam

Experiments have shown that under ordinary conditions the nutrition of the dam does not influence the growth of the foetus due to the small amount of nutrients required for its development as compared to milk production. When the ration is faulty, however, it quite often leads to premature birth and accompanying disorders. The chief value of giving the dam a rest is to prepare her for the strenuous lactation period following calving.

SIMPLE WAY TO FEED CALVES GRAIN WHEN RUNNING IN PASTURE

When fed skimmilk it is better to place each calf in a stanchion and as soon as each one has finished drinking it, feed them a little grain. Usually after finishing eating grain the calf has lost all desire for sucking ears, tails, etc.

Feeding the New Born Calf

The first milk or colostrum has been shown to be vitally needed by the new born calf. Studies made by Brody and Ragsdale of the Missouri Station indicate that a temporary immunity to various diseases results when the calf receives the colostrum. A mortality of from 50 to 100 per cent may be expected when calves are not given the colostrum. When calves from tubercular cows are to be raised, the colostrum should be pasteurized by heating in a water bath or double cooker, at 140 degrees F. for 30 minutes. In this way the colostrum will not coagulate upon heating. It can then be fed without danger of transmitting the infection.

The white of egg has also been found to be a fairly satisfactory substitute for colostrum. Of nine calves fed the white of egg, seven have been raised successfully. The whites of six eggs were mixed with the milk given to the calf the first feeding. Each following feeding the number was reduced one until only one was being fed. The feeding of one egg white was continued for the first week. This plan of feeding is worthy of a trial if for any reason colostrum cannot be fed.

In addition to the immunity acquired by virtue of the antitoxins which protect the calf from certain common diseases, the laxative effect of the colostrum cleans the digestive tract of fecal matter. While only a small amount of colostrum is necessary for the well being of the calf, due to the fact that the first milk is not generally used, it is a common practice to allow the calf to remain with the dam from two to four days until the milk can be used. The calf should then be taught to drink milk out of a bucket. In most cases this can be accomplished by letting the calf suck a finger while gradually forcing the calf's head into the pail. The finger is then removed and the calf will start to drink the milk.

From 2 to 5 pounds of whole milk is fed three times per day until the calf is three or four weeks old. Hulce and Nevens of the Illinois Station recommend that whole milk be fed at the rate of one pound of milk daily for each eight pounds of live weight. Weakly calves often do better if fed smaller amounts of milk four times per day.

The effect of varied amounts of skimmilk on the growth of calves was tried by Woodward of the U. S. Dairy Division. Sixteen calves were divided into four groups of four animals each. Each calf received whole milk for ten days and then gradually changed to skimmilk. At 15 days the following amounts were fed with the results indicated:

Rate of Feeding Skimmilk to Calves

Group	Skim-milk per day	Ave. daily gain	Skim-milk per lb. of gain
	Lbs.	Lbs.	Lbs.
1. At rate of 1-7 body weight	13.5	0.95	14.2
2. At rate of 1-6 body weight	17.0	1.09	15.7
3. At rate of 1-5 body weight	21.0	1.26	16.6
4. All they would take twice daily	24.2	1.48	16.3

For the sake of economy, milk from cows known to produce milk of low test should be used. Ordinarily calves will do as well if not better when fed such milk. The importance of having the pails clean and the temperature of the milk as near that of freshly drawn milk (95 degrees to 100 degrees F.) is emphasized by experienced calf feeders. Calves should never be fed in a trough together as some will over-eat while others will be under-fed. The trough also cannot be kept clean. Hooper of the Kentucky Station found that during the first 7 to 10 weeks of the calf's life, calves will be more thrifty when fed milk through a nipple, due to the fact that as they suck the milk they mix it thoroughly with saliva and take it slowly. After the seventieth day the nipple was no more effective than bucket feeding. These devices cannot be recommended, however, unless extreme care is taken to keep them clean.

Feeding Grain and Hay

When the calves are two or three weeks old, they will begin to eat small amounts of choice hay and grain. The grain should be fed dry and not mixed with the milk. The best time to feed grain is just after the milk has been fed. The hay can be fed later. When dry feeds are fed after the milk the calves do not try to suck each other as much as they otherwise would. Thrifty calves will eat about one-half pound of grain at six weeks, one pound at two months, and two pounds when between three and four months of age.

While milk is the best food for the young calf, experiments by Davenport of the Illinois Station, and more recently by McCandlish of the Iowa Station, seem to indicate that milk is not entirely fitted to serve as the sole diet of ruminants later in life. McCandlish fed nothing but milk and salt to two calves. The animals did fairly well for three months but from that time on did not thrive. One calf died when 176 days old and the other when 208 days old. It is thought that as the stomach enlarges, the milk being very digestible leaves the residue of indigestible matter of insufficient bulk to cause the proper movement of the contents of the digestive system. This results in a stagnation and consequent production of poison or toxic materi-

BETTER COWS AND LEGUMES DID IT

CLIFFORD FARMER, MISSOURI

"YOU will know his place by the brown buildings," the stranger whom I had stopped in the road told me in directing me to the farm of U. P. Burns, south Missouri dairyman, "—and the good fences," he added as an afterthought.

And I soon found that his directions had been right for, after driving through miles of hill country where many of the farms were not even fenced, I could appreciate what had been meant by "good fences". I found when I met Mr. Burns and his son, Maynard, that "good fences", neatness, was only a characteristic, a characteristic I saw manifest in the cow barn, in the pastures, and in the dairy herd.

"When I bought the farm eight years ago," said Mr. Burns, "the fence rows were thirty feet wide and there was some brush growing everywhere. Wide ditches followed the hollows in each field. The land, post oak flats they call it around here, was pretty thin. In fact, many have told me since that it was the poorest farm in the neighborhood." Which statement corroborated what the county agent, Walter F. Delp, had told me.

Now the farm looks different. The brush and neglected fence rows are gone. Clover grows abundantly where once it took much fostering to get it to grow. Neat, convenient, but not expensive buildings have replaced the shacks. Good Holstein cows have been the pivot about which the rest of the farming operations swing.

Mr. Burns was a traveling salesman before moving to the farm. The increasing interest in dairying throughout his territory in the Ozarks only increased his desire to own a farm. Another factor that influenced him to make a change was his son, Maynard, then eighteen, who had to quit college because of weak eyes. Realizing that it would be impossible for the son to work indoors, Mr. Burns put the matter up to him and they decided to try farming with Holstein cows.

So they went out in search of a farm. Not having had much experience with different types of soil, they were led to believe that anything that was not too rough for cultivation would make a good farm. So when a 120-acre plot was found in Greene County priced very low, they bought it. The first year showed them that the land needed something. The corn grew only waist high, then turned yellow and made only "nubbins" and the pasture turned out to be mostly weeds. "Legumes," said the county agent and they took his advice.

"I think legumes were our salvation," remarked Maynard, the enthusiastic junior partner of the Burns & Son firm, "—and dairy cattle. We had the soil tested and found it was sweet. But clover would not grow. So we tried soy beans and they did the trick. After growing them we had no trouble getting the clover to catch. We had bought up a few dairy cows, grade Holsteins, and used the manure from the herd to spread on the thinnest spots of the farm."

MAYNARD BURNS AND A PAIR OF HIS "SKIMMILK" HEIFERS

To go over the farm makes it hard to believe that clover once would not grow for now it grows vigorously. But soy beans are still the favorite with the Burns as a legume hay for cows. They consider it a better feed for milk production and get a bigger yield per acre than with red clover. A rotation of corn (for silage), wheat, or oats and clover, with soy beans worked in when clover is killed by a late freeze, keeps up the soil fertility.

A registered bull was placed at the head of the grade herd at the very beginning. So good were his calves that they decided to buy a few registered females. Buying only four as a foundation, the herd of 30 head now contains 12 registered females. Home records have been kept of each cow's production. These records have enabled them to cull out the poorer cows, as younger females of their own breeding came on to replace them, and has also helped in bettering their feeding methods.

These records are very interesting. Taking a few cows at random through the books, we find one cow produced as follows:

1920, 255.2 lbs. fat; 1921, 278.2 lbs. fat; 1922, 310.9 lbs. fat; 1923, 401.0 lbs. fat.

And another cow's record is: 1921, 184.9 lbs. fat; 1922, 267 lbs. fat; 1923, 325.8 lbs. fat.

And another: 1921, 247 lbs. fat; 1922, 270.9 lbs. fat; 1923, 463.8 lbs. fat.

"The increase has been due to better feeding and management, a better knowledge of how to care for the cows," said Mr. Burns. "We have always fed mostly home-grown feeds and, of course, now that we are growing more per acre than formerly we have more to feed. Then weighing the milk showed us how easy it was to make the cows increase by better feeding and proved to us that it paid.

"I believe too much is said about better breeding and not enough about better feeding and management. I know of several farmers who have bought extra well-bred cattle, half starved them and then blamed the cattle for not producing well. In a way a cow is just a machine and you are going to take out just in accordance with what you put into her. I certainly believe in better sires and good blood, but I'm sure the average herd's production could be increased by better feeding."

THE COW BARN ON THE BURNS FARM, BUILT OF NATIVE OAK AND STAINED BROWN WITH OIL

Not only are the cows well fed, but here the young stuff receives careful attention in order to be grown into large, strong animals. Heifers, raised on skimmilk and a liberal grain feed with good pasture in summer, have been developed on the farm so well that with their first calves they have milked better than their dams. Stunting a heifer the first year can never be overcome, according to Mr. Burns who has learned much from experience the eight years he has been on the farm.

The "brown buildings" that the stranger along the road had mentioned were built of native oak, sawed on the farm, and stained with a cheap grade of oil, making them neat in appearance and weatherproof. The cow barn, 30 by 40 ft., joined at one end by a silo and an old building used for hay and bedding storage, is cool in summer and warm in winter. Concrete floors, steel stanchions, and plenty of windows for sunshine and ventilation make it a very convenient, economical barn. A roomy machine shed where all the farm implements are housed and a poultry house built of the same material and stained brown, add much to the appearance of the well-fenced place. All of the work of building was done by Mr. Burns and his son, both of whom are handy with tools.

Water from a 300-foot never-failing well is piped to all parts of the farm and into the dwelling. The home, roomy and comfortable, contains modern equipment including a radio set to make farm life a pleasure.

From a financial standpoint the farm venture has been a success. But it has been more than that to the Burns. Maynard's eyes have regained their strength after ceasing the indoor strain on them, the Burns have proved to themselves and their neighbors that they can make good where failure was predicted and a wonderful new future has been opened up to them. With the good herd of Holsteins coming on, a productive farm, and a comfortable home, free of incumbrances, have they not a right to be well pleased?

Ohio Holstein Breaks World Record for Age

HOARD'S DAIRYMAN:—Pauline Brightview No. 113832, a pure-bred Holstein owned by Daisy Hill Farms of Ohio, has just completed what is believed to be a world's record for cows fifteen years old or over. Her record, made at the advanced age of fifteen years, six months and after dropping her twelfth calf, is given as 23.47 lbs. fat (26.84 lbs. butter, 80% fat) from 551.7 lbs. milk. These figures are as furnished by Jas. A. Reynolds who is in charge of Daisy Hill Farms.

PAULINE BRIGHTVIEW, OWNED BY DAISY HILL FARMS, OHIO

This is the second time this great cow has set a new high mark for her age. Last year, at fourteen years old, she broke the world's record for that age with 24.04 lbs. fat (30.05 lbs. butter) in seven days and 98.4 lbs. fat (123 lbs. butter) in thirty days. As a nine-year-old, she made a strictly official year record of 895.76 lbs. fat, and 25,606.1 lbs. milk.

The record of Pauline Brightview as a mother is about as imposing as her record as a producer. In twelve freshenings she has dropped five daughters and seven sons. Her oldest daughter and first calf is a 1,000-lb. cow and has had six daughters and two sons. Her second daughter, a 28-lb. cow, has had three sons and two daughters and her third daughter, a 900-lb. cow, has had three daughters and two granddaughters.

In the present Daisy Hill herd may be found Pauline Brightview herself, who gives no evidence of being much past the prime of life, also three of her daughters, five granddaughters, and four great granddaughters, all through the direct female line. It is not every breeding establishment that can show such a family all descended from one cow.

New York. W. A. PRESCOTT.

A Houston roadsign painter suggests the following signs for railroad crossings:

"Come ahead. You're unimportant."

"Try our engines. They satisfy."

"Don't stop. Nobody will miss you."

"Take a chance. You can get hit by a train only once."—Houston Post.

Tiddledywink Raleigh and Five of His Daughters

S. R. WINTERS, WASHINGTON, D. C.

TIDDLEDYWINK'S SNOWDROP
Record: 8,054 lbs. milk, 564 lbs. fat at 2 years, 10 months.

JERSEY BULL, TIDDLEDYWINK RALEIGH

TIDDLEDYWINK'S ROSIE
Record: 8,868 lbs. milk, 505 lbs. fat at 2 years.

RALEIGH'S QUIET LADY
Record: 7,611 lbs. milk, 494 lbs. fat at 2 years; 635 lbs. fat at 3 years.

RALEIGH'S PET QUEEN
Record: 7,750 lbs. milk, 459 lbs. fat at 2 years; 635 lbs. fat at 3 years.

TIDDLEDYWINK'S FAVORITE
Record: 516 lbs. fat at 2 years; 630 lbs. fat at 3 years.

TIDDLEDYWINK Raleigh, probably the youngest sire of the Jersey breed of dairy cattle to qualify for a silver medal, has been purchased by the Bureau of Dairying of the United States Department of Agriculture for breeding experiments at Beltsville, Maryland. This bull, bought by the federal government from Cole Laughlin of Ohio, is one of the three proven sires to be used in experiments in which close inbreeding and outbreeding of dairy cattle are being compared.

Tiddledywink Raleigh is the sire of approximately ten daughters on test that are making creditable milk and butterfat records. His dam, Gamboge's Tiddledywink, was an important cow, being the grand champion at the National Dairy Show in 1912. The latter has another son that has qualified for both silver and gold medals, reference being made to Tiddledywink Noble. This gives the distinction to Gamboge's Tiddledywink of being the only important cow having two silver medal sons. Furthermore, the bull recently acquired by the Bureau of Dairying is expected to qualify for a gold medal, in which event Gamboge's Tiddledywink will have two sons that have been awarded both silver and gold medals.

The newly purchased bull for the dairy experiment farm at Beltsville is of a splendid type and of a good size, according to R. R. Graves, in charge of dairy cattle breeding experiments for the Bureau of Dairying. This sire has three daughters that have complied with the Jersey Register of Merit requirements. Moreover, the remarkable production records of the daughters of Tiddledywink Raleigh were made when being milked only twice a day.

Better Bulls in Connecticut

A. R. MERRILL, CONNECTICUT

THE pure-bred bull campaign inaugurated last October in five counties in Connecticut has just rounded out a rather successful year's work. This campaign was put on to eliminate, as far as possible, the scrub bulls so much in evidence in this state.

In order that accurate information might be available, surveys were put on in New London, New Haven, Windham, Middlesex, and Tolland Counties, which showed that over half the bulls in use were scrubs.

Connecticut has been looked upon as a market milk state and few people have ever considered that the raising of calves amounted to anything. The surveys showed that the number of heifers raised annually, in these five counties, ran from 1,150 to 2,700, and that at least half of these were sired by scrub bulls.

Connecticut has been importing about 7,500 cows annually. These cows have not been of a type that has tended to increase the milk production of the state which averages 4,242 lbs. per cow. Considering the number of cows brought into the state, annually, and also the number of heifer calves raised, it seemed self evident that the only way to increase the average production of our herds must be by some constructive breeding plan. Naturally the first step would be by the use of pure-bred bulls.

Preliminary to this better bull campaign Mr. H. F. Johnson, at that time county agent for New London County, had during the winter of 1923 carried on a dairy survey to determine the standard of dairying in that county. This survey paved the way, so to speak, for the surveys made in the other counties later on. In addition to the survey he had placed eighteen pure-bred bulls. This work seemed so much worth while that at the extension conference, held at Storrs, in October 1923, it was decided to put on a campaign for better bulls in the above named counties. Since this was distinctively a dairymen's problem it seemed only reasonable that the dairymen themselves should play an important part in the work to be done. The following method for carrying on the work was decided upon: The first step was to secure the approval of the Farm Bureau directors who appointed a farm bureau dairy committee. This committee, working for the county agent, appointed a county campaign committee made up of one member from each town who was to act as chairman of a town committee to be appointed from each town. These town committees made surveys of the dairy interests in their respective towns, securing information as to the number of cows and heifers kept, number of heifer calves raised yearly, and the number of pure-bred or scrub bulls kept on each farm. After this information had been secured, a town meeting of this committee was called, at which time the information gathered, supplemented with figures taken from Dairy Commissioner Holt's office, was discussed. General plans for the carrying on of the campaign were taken up. These plans included the sending out of publicity notes regarding the purpose of the work and stories of actual results obtained where pure-bred bulls had been used on grade cows, were written by Walter Stemmons, agricultural editor for the Connecticut Agricultural College.

Co-operative work was taken up with the different breed organizations who sent representatives to assist at public meetings, these representatives also assisted the county agent and town committees in visiting owners of scrub bulls. Public meetings were held in different towns throughout the counties and much publicity was given regarding the value of pure-bred bulls. The different towns and county publications assisted in this work by printing reports of the meetings and giving other information regarding the work from time to time. In all of the work there has been a fine spirit of co-operation shown by all of the parties interested. The actual responsibility of the campaign has been taken by the individual county agents who have been ably assisted by their county and town committeemen.

There are still many scrub bull owners to be visited in all of these counties, in fact not over half of the scrub bull owners in New Haven, Windham, and Tolland Counties have been visited to date.

Up to October first, 1924, 253 pure-bred bulls have been placed in these five counties, most of these replacing scrub bulls.

Probably the most intensive work has been done in New London County. The work in this county has set the record for all county work in the United States. Since the work started a year ago 112 pure-bred bulls have been placed. No other counties in the United States with the exception of two have ever reached anywhere near this mark. Blue Earth County, Minnesota, placed 106 bulls and a California County placed 104.

The work in this county was directed by Walter T. Clark, the present county agent, and he was assisted by John A. Simms, Extension Animal Husbandman. These two men with the assistance of their various committeemen have put across a piece of work that should receive great credit. This county is by no means an outstanding dairy county, consequently the work accomplished is still more noteworthy. These men have been able to show the value of better breeding and the dairymen have profited by their advice.

In all of the work on this campaign it has been up to the individual committeemen to help put the work across. Public spirit has done the work. No paid sales agents have ever been employed, but the actual work has been carried on by enthusiastic dairymen.

In order to help prospective purchasers, the Extension Service has called upon different breeders and associations to list available bulls that they have had for sale. The value of production has been emphasized. The minimum limits for production have been set as follows: Holsteins 12,000 lbs., Ayrshires 11,000 lbs., Guernseys 10,000 lbs., and Jerseys

(Continued on page 530)

DAIRYING IN SOUTHERN CALIFORNIA

A. J. MASON, CALIFORNIA

A SYSTEM of dairying differing from that of any other milk producing section of the United States has been developed in Southern California. It is the outgrowth of conditions peculiar to the Los Angeles district, and in many respects is contrary to theory and precedent.

Most of the whole milk producers catering to the Los Angeles market are within 50 miles of the city and operating upon land ranging in value from $500 to $3,000 an acre. Consequently they concentrate upon as small an acreage as possible and buy a large percentage of their feed. They are not concerned with the breeding end of the business and, when possible, avoid raising calves.

This results in a tremendous "turnover" of dairy cattle, authorities estimating that from 2,000 to 3,000 cows a month are necessary to supply the demand from the comparatively small district tributary to the city.

Exactly the reverse of the situation prevailing in other states is found, in that a cow which has just freshened and can be guaranteed as to production is worth considerably more than a "springer" of even better breeding.

In fact, breeding is a comparatively minor consideration with commercial dairymen of the Los Angeles district. They do pay considerable attention to form, capacity, and appearance, but are interested mainly in keeping their cows at the height of production during as many months as possible. They have not the land, feed, nor time to spend upon caring for "drys", erratic producers, heifers, and calves.

The general plan is to weed out every cow that will not produce 30 pounds or more, and many animals are retained only a year, although some of the best individuals in the stronger dairies are held two or three years.

Dealers are constantly scouring the state and even adjoining states for new stock to supply the ever-grinding mill. And, of course, one evil of the system is that many of the less desirable cows find their way back into the sale ring. Thousands of animals, however, which in other dairy districts might be considered worthy of breeding and retaining for a much longer period, are slaughtered.

A serious evil which has attended dairying in Southern California in the past was the "T. B." menace. Until the passage of a recent county ordinance making it a misdemeanor to bring into Los Angeles County or offer for sale any cattle not inspected and passed by an official, licensed veterinarian, hundreds of infected cows found their way to local producing plants.

By pasteurizing the milk, however, producers were enabled to market the output, and the traffic in doubtful animals reached large proportions. Now California is well on the way toward stamping out the tuberculosis evil with several counties already declared free areas and others under consideration.

Los Angeles County, anticipating a veritable onslaught of undesirable stock as soon as the hoof and mouth disease quarantine was lifted, made effective in June of this year her own regulatory measure, with provision and funds for strict enforcement.

Most elements in the industry, including the auction companies (which are an important factor) have seen the wisdom and necessity of this law, or at least the futility of opposing it, and have announced their intention of co-operating.

Auction selling is regarded as an integral part of the Los Angeles dairying system. In fact, it is doubtful whether the enormous traffic in cows could be maintained were it not for the speed with which the sales are conducted.

One local auction company during one year held more than 300 dairy sales, averaging 35 head, with an average total time for each sale of less than three hours! More than 12,000 cows were put through the ring by this same concern last year, at an average price of $125 a head. Most of these were sold "on time", with little or no payment down and the balance payable in nine months through an allied loan company.

It is estimated there are normally about 1,200 herds supplying whole milk to the city of Los Angeles, of which the most distant is not more than 100 miles away from the City Hall, with the majority from 10 to 50 miles out. Practically all these follow the general plan of high speed production without regard to length of life or ultimate disposal of the animal.

"A wasteful system," is the read-

(Continued on page 527)

INDIANA FEEDING EXPERIMENT

WHAT are the comparative values of soy beans, tankage, alfalfa pasture, and mineral mixture when fed self-fed free choice with corn to pigs weighing 74 lbs. beginning weight? This is a question answered by a recent report from the Indiana Experiment Station.

The experiment indicates that soy beans, when properly fed, compare very favorably with tankage and with alfalfa pasture as protein supplements in hog feeding rations. The experiment also suggests that simple mineral mixtures and alfalfa pasture can well be more generally used in pork production.

The conditions of the feeding experiment were as follows: The initial average weight of the pigs used was 74 lbs. Ten pigs were used in each lot. These pigs are to be carried to 220 lbs. final weight. The mineral mixture used was composed of 10 parts of wood ashes, 10 parts of 16 per cent acid phosphate, and 1 part of salt by weight. Corn was charged at $.84 per bushel, soy beans at $1.25 per bushel, tankage at $65 per ton, and pasture at $6 per acre. The results given cover the first 90 days of the experiment.

In the dry lot section group 1 had corn alone; group 2, corn and mineral; group 3, corn and soy beans; group 4, corn, soy beans, and mineral; group 5, corn and tankage; group 6, corn, tankage, and mineral.

In the alfalfa pasture section six groups of pigs were fed in a similar way to those in the dry lot section.

It is interesting to note that corn alone in dry lot feeding is most expensive when compared with protein supplements. It took 743 lbs. of corn worth $11.15 to produce 100 lbs. of pork in dry lot, whereas 290 lbs. of corn plus 100 lbs. of soy beans produced 100 lbs. of pork under dry lot conditions and the cost was only $6.43. The cost goes down to $6.02 when 286 lbs. of corn, 78 lbs. of soy beans, and 5.3 lbs. of minerals are fed in combination. Corn, tankage, and mineral produced 100 lbs. of pork at a feed cost of $6.28.

Here is one to think about. In lot one, dry lot section, it took 743 lbs. of corn worth $11.15 to produce 100 lbs. of pork. In lot one, alfalfa pasture section, it took only 372 lbs. of corn plus the alfalfa pasture to produce 100 lbs. of pork costing $5.83. In other words, 754 lbs. of corn fed in combination with alfalfa pasture will produce 200 lbs. of pork at a cost of $11.66 for the 200 lbs., whereas, if 743 pounds of corn are fed alone, dry lot feeding, it will only produce 100 lbs. of pork and the cost will be $11.15, or only $.51 less than for the 200 lbs. of pork in the alfalfa lot.

Corn, soy beans, and mineral produced 100 lbs. of pork at a feed cost of $5.70, when alfalfa pasture was available. Corn, tankage, and mineral produced 100 lbs. of pork at a feed cost of $5.67 under similar conditions.

Purdue experiments show that whole soy beans are just as efficient as ground soy beans for fattening hogs. It pays to feed a simple mineral mixture when soy beans are used as the protein supplement. They also show that mineral mixture should be fed when soy beans are hogged down with corn. Strong, healthy pigs are produced by sows fed on a corn-soy bean-mineral ration.

Soy beans without mineral are worth $1.12 per bushel as compared with $1.52 per bushel with mineral, when compared with tankage worth $65 a ton.

If corn is figured at $1 per bushel, soy beans without mineral are worth $1.08 per bushel and with mineral $1.64 per bushel.

With corn at $.84, soy beans at $1.25, tankage at $65.00, mineral $.02 and pasture at $6.00, soy beans in dry lot are worth $1.18 without mineral and $1.34 with mineral. On pasture, soy beans without mineral are worth $1.25 and with mineral $1.89 per bushel.

Lot 1—These pigs gained only .41 pound daily on corn alone dry lot feeding experiment at the Indiana station.

Lot 7—These pigs gained 1.30 pounds per head daily on corn alone and alfalfa pasture at the Indiana station.

Lot 4—These pigs gained 1.54 pounds per head daily on a corn —soy bean—mineral ration at the Indiana station.

Mississippi State Fair

HOARD'S DAIRYMAN:—The dairy cattle exhibit at the Mississippi State Fair, October 13—18, was an outstanding feature of the fair. A "Little National" was what one of the exhibitors termed it. And it looked like it was pretty aptly named as there were 240 head of Jerseys on the grounds. Dairy cattle and Jersey cattle are practically synonymous in this section of the country. Of course, other breeds have been introduced in a limited way but they do not seem able to displace the Jersey in the popular fancy. No other breeds were represented at the fair this year.

There is no estimating the benefit to this state of the splendid exhibit. Mississippians were not as strong among the exhibitors as has been the case in the past but they were strong at the ringside on judging day and in the barns all through the week. The largest exhibit previous to this year was 141 head in 1921. That gives an idea of the improvement in numbers. The quality of the animals was fully up to and probably better than any exhibit held heretofore in this state.

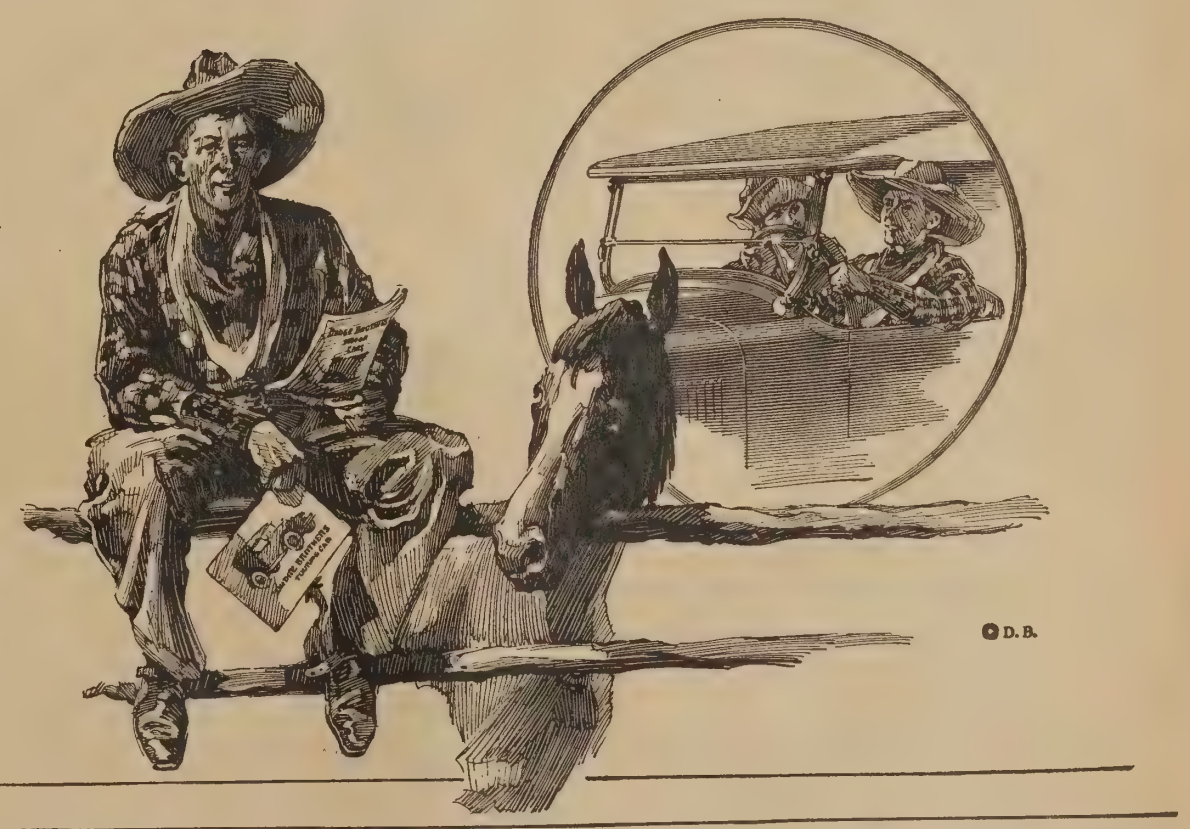
As stated above, the number of animals exhibited by Mississippians was smaller than had been hoped for. However, the number of individuals represented by the cattle owned within the state was quite large. Five county herds were on exhibit. A county herd is made up of two bulls and six females and must represent at least four owners. The five county herds would thus represent a minimum of twenty owners. As a matter of fact twenty-four were interested in the county herds. Add to that a considerable number of local people with small entries and it gave us quite an imposing group of beginners. That it had been well worth their time from an educational standpoint and they would be back again was the sentiment expressed by nearly all of them. And it must have been quite an interesting lesson to them. To see them grooming their cattle under the directions of the experienced herdsmen gave one an insight into the fraternal feeling existing among the owners of pure-bred cattle.

One of the most interesting exhibits of the fair was put on by the Illinois Central Railroad Company. It consisted of six pure-bred bulls, part of a lot of twenty which they bought two years ago and placed with farmers along their lines, and a total of fifty-six heifer calves. The larger part of these calves were grades. The lesson would have been more forcefully driven home if the dams could have been shown but it made a fine demonstration of the value of a pure-bred sire as it was. Incidentally one of the bulls was good enough to stand in second place in a class of twelve, while another won a fifth.

Professor J. P. LaMaster of Clemson College, South Carolina, awarded the ribbons. Competition was close in nearly every class and the premiums were pretty well distributed. Henderson had the junior champion bull in Dahlia's Noble Major 212471, while Ridge Spring Farms had the senior and grand champion in their three-year-old Glenn's Raleigh Lad 198654. In the female classes, Inderkill captured the junior championship on Chieftain's Flora Mary Dean 564604, a senior yearling heifer, and the senior and grand on Financial May Queen 579180. She showed size, capacity, udder development, quality, and type combined in a way that could not be denied. Fagan felt especially pleased when the calf classes were reached. His young bull, Leda's Raleigh's Grandson 206592, has been siring just the kind that Professor La Master likes and they were well up in the winning each time. All in all, it was a show from which good is bound to come. H. C. FERGUSON.

YOU KNOW IN ADVANCE

Dodge Brothers Dealers realize that a car's good performance is no longer the sole basis of an owner's good will.



It is equally essential that dealers give good service.

Because of this, they employ the Flat Rate Service System, which insures accurate work at a fair, predetermined price.

When you leave your car with a Dodge Brothers Dealer for service you know just what work will be done, when it will be finished and what it will cost. There are no unpleasant surprises in your bill

You know in advance.

DODGE BROTHERS (CANADA) LIMITED
WALKERVILLE, ONTARIO

Maine Milkmen's Herds Healthiest

A recent survey of 506 herds supplying the public with milk shows that 329 of these, or 65%, have been tested for tuberculosis within the past year and reactors removed. The fact that only 1.47% of all the cattle tested in Maine during the past year have reacted indicates that but very few cattle remain which are infected.

Maine cattle have been found to have fewer reactors than any other state east of the Mississippi River, several states having from 20 to 35 per cent reactors. Roughly speaking, for one reactor in Maine twenty are found in these other states.

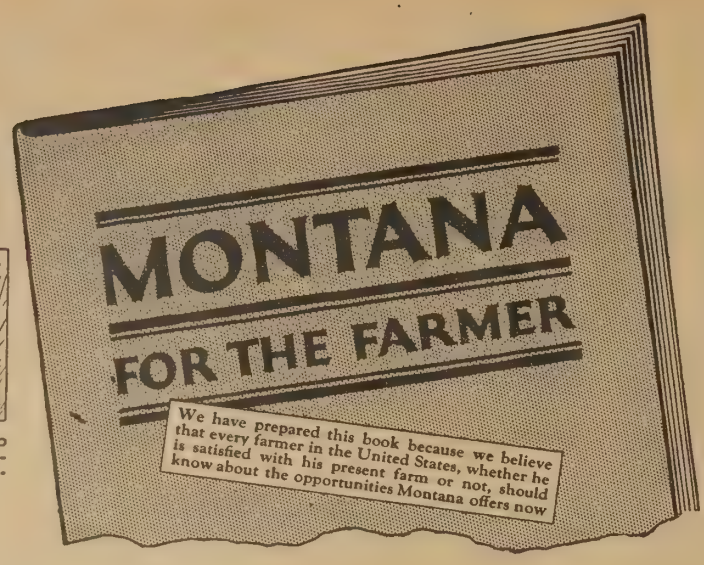
Among milk dealers, a larger percentage of herds tested have been found near the cities and fewer herds tested which are supplying the small towns and villages.—F. A. BARBOUR, State Dairy Inspector.

Bert: And you girls never quarrel?

Gert: My, no! We live in an apartment where there isn't room for an argument.—Everybody's Magazine.

Boss—The last boy I had was worth twice as much as you.

Store Boy (timidly)—Please sir, did he get it?—Good Hardware.



Ford Owners!

stop cold drafts and dirt coming up through pedal slots. Anyone can attach a GRANT Under-floor Draft Shield in five minutes. Can't interfere with operation of pedals. Price $1.00 prepaid. Money back if not satisfied.

H. J. Rocek, *who came to Montana from Minnesota*

What they have done you can do

This free book will tell you why

The farmers whose portraits appear on this page are just four of the thousands who have made a little capital go a long way in Montana.

They have worked hard, of course. Farming anywhere is a man's job.

But there are definite reasons why hard work and little capital will produce better results in Montana.

Yields per acre on Montana lands are high. Montana wheat commands a premium. Its spring wheat shows a far higher percentage grading No. 1 than that of any other state. Its potatoes, its hay, its oats, its barley, its peas, its sugar beets, and its beans are noted for their high quality.

And, says an article in the Country Gentleman for April 26, 1924, "Not since homestead days . . . has land in Montana been so cheap. Doubtless it will never be so cheap again."

Surely as this article points out, it is bargain day in Montana.

Because we believe that every farmer in the United States, whether he is satisfied with his present farm or not, should know about the opportunities Montana offers now, we have prepared a little book, "Montana for the Farmer."

You can get this book free by sending us the coupon below. It is not just a "boost" for Montana. It is based upon the most accurate facts we can find. The truth about Montana is good enough.

With it you will get a folder containing the personal stories of the farmers whose pictures you see here and of others like them.

Learn why Montana is both a better place to farm and a better place to live. Send the coupon today and get the book and folder by return mail.

Water Won't Freeze
Down In The Ground Where Nature Stores It

Even on the coldest winter days a Fuller & Johnson Farm Pump Engine will pump the pure, fresh water direct from the well, at Mother Nature's temperature. Stock will drink more and thrive better, which means greater returns, and dairy cows will produce more milk.

The Fuller & Johnson Farm Pump Engine is air cooled, of special design, cannot freeze. It is a simple, compact, practical pumping outfit. Comes complete and is easily attached to any pump. Mounts on any well platform. Does not interfere with windmill. No belts; direct connected, enclosed gear drive. Easy to start. Costs so little to operate, it soon pays for itself.

Write for free booklet 17A. It tells how to insure a satisfactory water supply in zero weather.

It costs you less to use the best

Association Notes by Testers

West Hamilton County, Ind.: Four silos were built, three wood stave and one cement, two being built for summer use. Six cows entered in R. O. M. testing. One member equipped his milk house with a steam boiler. Five barns were whitewashed. The condensery paid $1.60 per cwt. and the creamery $2.00 for market milk. Milk retailed for 12c per quart in September.—T. D. Barclay.

Clark—Scott, Ind.: Oscar Erni's pure-bred Jersey finished her lactation period of 343 days with 603 lbs. fat. This cow was first in the state class at the state fair. Mr. Erni also has a grade Jersey which in the first six months of the testing year produced 383 lbs. fat. Market milk sold for $2.32 per cwt. Sweet cream brought 44c per lb. fat in September.—W. W. Barnett.

Chelsea and Manchester, Mich.: All herds in this association have been tuberculin tested and very few reactors found. The soil on over 20 farms has been tested by the tester and all but one need lime. Nearly all members use pure-bred sires. Market milk sold for $3.00 per cwt. and retailed for 8—10c per quart in September.—G. Crowell.

Rives—Jackson, Mich.: Two separators were tested with good results. One barn was whitewashed. The sixth member has started keeping milk records. Nearly all members feed grain. Corn is nearly mature here. In September market milk sold for $2.50 per cwt. The creamery and cheese factory each paid $1.70 per cwt. for milk.—J. Bird.

Grays Harbor, Wash.: Milk and fat averages were lower in September due to dry pastures, the driest in several years. The condensery paid 52c per lb. for fat, the cheese factory and creamery 42c, in September.—F. R. Haynes.

Fayette No. 1, Ia.: Several members started feeding their cows grain. Green corn is being fed to some herds with satisfactory results. The creamery paid 45c per lb. for fat in August.—C. White.

Superior, Wis.: Most members have started feeding for winter production. A large number of herds are kept in barns at night. The highest cow made 354 lbs. fat in six months. There are also a number around 300 lbs. fat. Market milk sold for $1.90 per cwt. and retailed for 10—13c per quart in September.—H. High.

Mt. Hope—Lancaster, Wis.: Two members installed milking machines. Two new barns were completed. About one-half the members feed grain to cows on pasture. The cheese factory paid 45—50c per lb. for fat, the creamery 38c. Milk retailed for 10c per quart in September.—B. G. Paulson.

Northfield—Jackson, Wis.: Alfalfa acreage is on the increase. Association stock and calf club calves won several ribbons at surrounding fairs this fall. Butterfat brought 39c at the creamery in September. Farmers are not encouraged to feed grain in any amount.—C. Hoke.

South Menominee, Mich.: Two new dairy barns are being built and nine members feed silage and grain to supplement pasture. In September milk retailed for 10c per quart. The cheese factory paid 40c per lb. for fat.—R. D. Maxon.

Cass Co., Mich.: Two new members started using milk sheets. Five diplomas were received from the National Dairy Show. Feed is a hard proposition, with no corn and early frosts feared. Silo filling has begun. High butterfat average was 35.4 lbs. made by T. B. Moore with a herd of 8 pure-bred and grade Holsteins. The association average for September was 19.3 lbs. fat. Market milk sold for $2.12—2.60 per cwt. in September.—A. Morley.

North Antrim, Mich.: This association boasts of 31 members and is in its third successful year. Butterfat sold for 35—36c per lb. in September. The 241 cows tested averaged 449 lbs. milk, 20.5 lbs. fat, which is very low due to many cows being dry. The net gain for cows on test was $4.61.—G. G. Mullett.

Pine Co. No. 2, Minn.: Most cows are dry. The association had its lowest average in September, being 20.1 lbs. fat. About 40 cows will reach the 365-lb. mark by the end of the year, which is next month. The cheese factory paid 41c per lb. for fat, the creamery 40c. Milk retailed for 9c per quart in September.—H. Roth.

Franklin—Jefferson—Marion, Ill.: Thirteen cows were purchased in Wisconsin by the Wardland Farms. A few members attended the National Dairy Show in Milwaukee and purchased some new equipment. Silo filling and hay making is going on in full blast. In September market milk sold for $3.00 per cwt. and retailed for 12½—15c per quart. The creamery paid 37c per lb. for fat. Two new milkers have been purchased since the middle of August. One new Delco light plant has also been purchased.—G. R. Smith.

Columbia, Ore.: Butterfat took a sudden drop of 5c a lb. but is slowly recovering. The fight against the sale and manufacture of oleo is on in full blast in this state and indications point to a tough battle. Market milk sold for $2.20 per cwt. and retailed for 8—11c per quart. The cheese factory paid 44c per lb. for fat in September.—W. T. Noble.

Snohomish Co., Wash.: The first of the year a new association will be started for the small dairyman. The plan of operation will be for each dairyman to take his own samples. These will be gathered up by the tester and tested at some central station. This arrangement will enable a tester to care for several herds each day. The new association will in no way affect the working of the present association which will continue as before. Market milk sold

the first half of September for $2.50 per cwt., the last half of September for $1.80, and retailed for 10c per quart. The condensery paid $1.80 per cwt. for milk in September.—D. L. Saunders.

Greene Co., Mo.: The outlook for dairying is very good as the local market is in strong demand for good quality product and good feed is plentiful and moderately priced. The 333 cows tested averaged 429 lbs. milk, 19.63 lbs. fat in September. Local breeders did well at the Ozark Stock Show. Market milk sold for $2.50 per cwt. and retailed for 12c per quart in September.—V. L. Gregg.

Culver, Ind.: The herd of J. A. Newman has qualified for the bronze medal given by the Indiana State Dairy Association for a herd with ten cows producing in excess of 300 lbs. fat yearly. This is the second herd from this association to secure this honor. The pure-bred Guernsey herd of C. E. Lewis had the high fat average for September of 39.8 lbs. fat. Market milk sold for $2.45 per cwt. and retailed for 10—12c per quart. The cheese factory paid $1.30 in September.—W. R. Matthews.

Des Moines Co., Ia.: Records are now complete for ten months on 20 herds in this association. The average production of the best cow in each herd is 6,539 lbs. milk, 318.8 lbs. fat during the ten months, while that of the poorest is 3,163 lbs. milk, 150.5 lbs. fat. The average feed cost for the first 20 cows is $61.71 and for the latter 20 cows $59.71. The most economical producer in this association is a registered Jersey 5-year-old that produced 6,098 lbs. milk, 366 lbs. fat on $43.76 worth of feed. The most expensive producer is a registered Guernsey 9-year-old that produced 2,371 lbs. milk, 127 lbs. fat on $160.19 worth of feed. The cow with the highest record is not the most economical, nor is the cow with the lowest record the least economical. Jersey, a cross bred Jersey—Holstein 5-year-old, produced 9,378 lbs. milk, 439.5 lbs. fat on $74.42 worth of feed.—C. M. Deem.

Faribault No. 2, Minn.: This association completed six months' work at the end of September. The high cow in the association is a grade Guernsey owned by Lewis Almberg, with 5,939 lbs. milk and 319 lbs. fat. The amount received for this fat was $137.92. The feed cost was $13.11, leaving a net profit of $124.81. Last April two men fed legume hay. This winter there will be six members feeding alfalfa, three clover, and one soy bean hay. Nineteen members have silos; five have milking machines, one of which was installed this summer. Eight members have drinking cups. Two faulty separators were replaced by new ones. One member has put in a new ventilation system and one drinking cups. Members of this association are ordering their mill feeds in carload lots and getting it much cheaper.—J. Welsh.

Iowa Testers Organize

HOARD'S DAIRYMAN:—This year an attempt was made at the Dairy Cattle Congress to establish a more close contact with the testers. The strength of the associations is dependent upon the strength and ability of the testers. The first annual banquet and convention of testers during the Dairy Cattle Congress was of inestimable value to everyone connected with cow test association work.

GUERNSEY HERD OF ED. BAUMBACH

This herd has an average of 335 lbs. fat in the Central Monroe County, Wisconsin, Association. The cow at the extreme right made 402 lbs. fat last year, and for the first two months of present year has made 152 lbs. fat.

One of the veteran testers, Oliver Constable, expressed the consensus of opinion of the testers when he stated at the banquet, "The successful tester must possess dependability, ability to co-operate, a good personality, and a wealth of determination to succeed.

"A meeting of this kind gives a tester renewed faith in his work and a determination to do better work when he returns to his association. I have hoped for an opportunity of this kind for years."

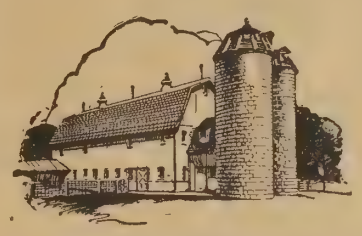
Forty-nine enthusiastic testers, and association members made the first banquet one of the most lively as well as instructive gatherings of the week.

Director R. K. Bliss of the Extension Service gave the principal address of the evening. Others on the program were: Earl Weaver, professor dairy husbandry; Clyde Bectelheimer, secretary of the Iowa Creamery Managers' Association; F. E. Ferguson, field secretary, Iowa State Dairy Ass'n., testers and members of the Extension Dairy Husbandry Department. C. B. Finley, professor of the Dairy Husbandry Extension Service, was toastmaster.

Following the banquet a testers' association was organized with R. C. Munkwitz of the Pioneer Association, Waterloo, as president, Ed. Mathre of Mason City, vice-president, and J. E. Deakins of New Hampton. as secretary-treasurer.

The association plans to hold two meetings the coming year and to handle the annual banquet at the Dairy Cattle Congress.

Iowa. B. ODERKIRK.



Dairylike Zanzibaria, a Jersey owned by Ayer & McKinney of New York, made a very good showing on her first Register of Merit test when she produced 759.34 pounds fat and 14,978 pounds milk in 365 days as a junior four-year-old.—American Jersey Cattle Club.

Re-roof for the last time

—right over the old shingles

Re-roofing with Johns-Manville Asbestos Shingles means fire-safety and permanence for old houses as well as new ones.

Lay Johns-Manville Asbestos Shingles right over the old roof of any building on your farm. Get permanent and fire-safe shelter for your home, your live stock and crops.

THERE'S only one way to get a permanent roof—use a permanent shingle. Johns-Manville Asbestos Shingles are based upon asbestos rock fibre. When you apply them you have roofed or re-roofed for the last time.

Just lay Johns-Manville Asbestos Shingles right over the old shingles. No need to tear off the old roof. No dirt! No clutter! And you have a new and beautiful asbestos roof that should shelter your home as long as it stands.

You save the cost of tearing off the old shingles and having them carted away.

But this saving seems only incidental when you consider the far greater savings you make by having, at last, a permanent asbestos shingled roof on your buildings. You end roofing repair bills. If you re-roof with Johns-Manville Rigid Asbestos Shingles you will never have to lay out money again for re-roofing.

Johns-Manville Asbestos Shingles have all the traditional fire-safety of asbestos. This means that your home is always protected from the danger of flying embers from a nearby fire. They are made in several artistic shapes, and you have your choice of several soft, rich colorings.

There is an asbestos roofing for every kind of farm building. Besides Asbestos Shingles, Johns-Manville makes Asbestos Ready Roll Roofings—plain black, or surfaced with beautiful red or green crushed slate. These roofings give you permanence and fire-safety for roofs where roll roofing is desired.

Save money on your new roof. Be sure to send in the coupon for full details.

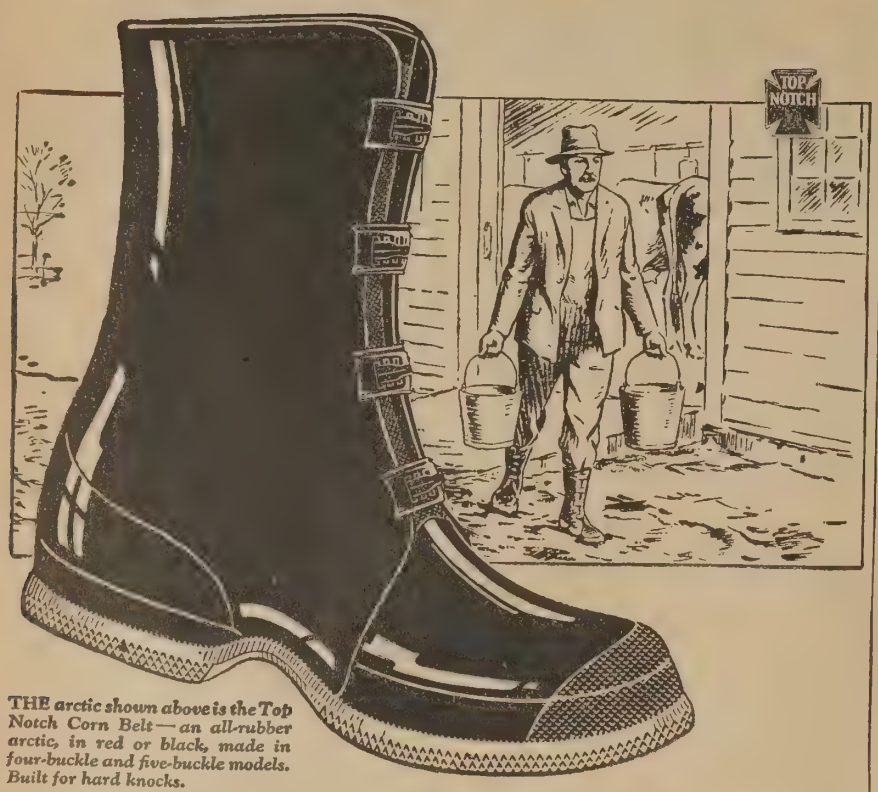
Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

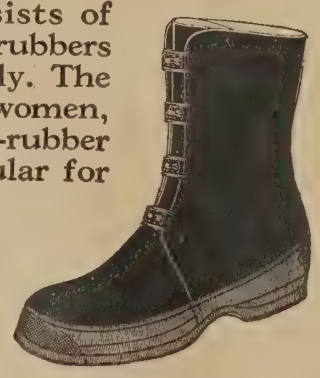


Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Write for free sample bottle. Wells & Richardson Co., Burlington, Vt.

Send for Catalog
FARM WAGONS

High or low wheels—steel or wood—wide or narrow tires. Wagon parts of all kinds. Wheels to fit any running gear.
Catalog illustrated in colors free.
Electric Wheel Co., 31 Elm St., Quincy, Ill.

THE arctic shown above is the Top Notch Corn Belt—an all-rubber arctic, in red or black, made in four-buckle and five-buckle models. Built for hard knocks.



Tested for Mileage

TEST pairs of Top Notch Rubber Footwear are put through the hardest kind of service under actual wearing conditions in mud and slush. We *make sure* that they will stand up. If there were any weak points those tests would reveal them.

After these test pairs have made good, every other pair of that particular kind of Top Notch Rubber Footwear that leaves our factories is also made by hand with the same exacting care and the same superior grade of materials as the test pairs. When you see Top Notch Rubber Footwear in your dealer's store, you can be sure they will give satisfactory wear.

The Top Notch line consists of boots, arctics, heavy and light rubbers for every member of the family. The Top Notch "Snoshu" for women, misses and children is an all-rubber gaiter that is especially popular for rainy weather.

Top Notch Rubber Footwear costs no more than the ordinary kind. It will often give twice the service. You can always recognize it by seeing the Top Notch Cross on the soles. The best stores carry Top Notch Rubber Footwear or will be glad to get it at your request.

TOP NOTCH REDFORE

A long-wearing, cloth-top gaiter of superior quality that will be sure to give satisfaction.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Wing Comes Back

HOARD'S DAIRYMAN:—In your Oct. 17th issue Mr. Jones from Maine takes issue with some of my thoughts and questions my being a farmer at all. Merely for the purpose of relieving his mind, may I state a few facts?

My father was a New York farmer who came to Ohio seeking more fertile soils and settled in this section a few years before my birth. He reared his family upon Puritanical principles; we were taught to work, to study our Bibles; to honor and obey our parents. He was a skilled farmer and he taught us thoroughly, both theory and practice, in this profession.

He left us 196 acres of well tilled, fertile soil and I have farmed continuously all my life with the exception of five years when my health failed. At present I am handling a little over 500 acres; for years I have started the day at from 4 to 4:30 and among my neighbors I have the reputation of leading an active life. Life has been no kinder to me than to the average man. My early dream of a college education and work as an electrical engineer was shattered when at 18 my health failed and I lost five full years in regaining it.

I was fortunate as many another man is in marrying a true helpmate. I am fortunate to still have her with me.

I was less fortunate when our only daughter, just budding into womanhood, and a child who would be the pride of any parent, went onto the surgeon's table, gayly, obedient to the slightest wish of her parents, and a few moments later went to the Great Beyond, taking much of her mother's heart and mine with her.

I am indeed fortunate in having four children left, little Ben and Joe who are four and six years, respectively, and as sweet as anybody's children. Charles Winston, who is ten, a sturdy boy, resembles his father in being slow in speech and thought, and Gardner, 14, who stands only about an inch below his father, five feet, ten, and has many of his father's traits of character and ambitions.

In business I have had the pleasure of making comfortable amounts of money at times and again of taking losses that were sickening. All of these things, however, I consider as unimportant, except as they might or might not affect my thinking and my theories of life.

From what I have seen, those who actually get the most out of life have suffered deeply, have labored under serious disadvantages, and have been deprived of the ease that money gives. It is this observation that leads me to say that life is mostly what we make of it ourselves. I believe that we appreciate the things around us very largely as we are receptive to the influences with which our Maker has surrounded us.

A few days ago I clipped from Hoard's Dairyman a remarkable and very unusual editorial. It says in part, "Agriculture may be said to include not only the cultivation of the land but the culture of the people who live on land. Wealth may be defined as anything that ministers to the wants and happiness of man and the ownership and possession of which can be transferred from one person to another. Its original sources are the sun, soil, air, water, plants, animals, and labor." Broad and true as this statement is, it seems to me that it should be made even broader. I wonder if I can show you just what I mean. I stood at the edge of the mountain whose top formed our summer range in Utah. Before me stretched a panorama so wonderful that no man could look without a feeling of wonder. First came mighty canyons, mile after mile of them, their north slopes pine and spruce covered, the south slopes dotted with cedar. Farther away were countless smaller canyons, like the waves of the sea when storm threshed. Beyond these the rim of the Book Cliffs, edging the desert, its grey line stretching smooth and regular for many miles from Green River to Castle Gate, in my line of vision. Still beyond was the great San Rafael desert rolling in gentle foothills and draws that looked no more than ditches from where I stood. Across its comparatively smooth surface crept a train, so small that it hardly seemed possible that it was real. As far as the eye could reach ran the desert. On days that were very free from haze a range of mountains, looking like a bank of low hanging clouds, could be seen, a full two hundred miles away.

Many, many times this scene unrolled before me and each time I thought unconsciously, "What hath God wrought?" Who owned this great tract? It happens that practically all of it is so wild and of so little value, as money goes, that it is the property of the U. S. government. That, however, is unimportant; the scene, and all that it means, is indelibly impressed upon my brain, and belongs to me. If you were there we could share it and there need be no jealousy over the matter whatever, for there is enough of it for all. Who owns the blue vault overhead? Who owns the south wind? Who owns the sun's rays that make our planet a comfortable place in which to live? Who owns the rain that refreshes our plants and makes them grow? Who owns the energy that changes cold soil to living plants, and thence to animals? Who owns the birds and flowers? Who owns the brush that today is transforming the leaves from their summer green to garnet, carmine, copper, and gold? Certainly He who planned the world in all its beauty in the beginning does. Intentionally He made it a pleasant place to live with countless things to delight the eye and all the senses.

That being true, and because He placed these things here to carry certain messages to us, are they not mine and yours? Is this not wealth that is not capable of being made private property, certainly not transferable, and all the better that it can not be so?

Actually, is there not far more of wealth in the world in a form that money can not buy than in that which is purchasable? And if this wealth is given freely by our Maker, need we worry greatly over things that we can not buy? The balance is in our favor, because we who live in the country receive more of the limitless blessings than do those who live in cities.

Pure-breds Do Pay

HOARD'S DAIRYMAN:—No doubt some of you farmers have often heard Mr. D. D. Aitken say that any man with average intelligence can buy a pure-bred cow and that she will pay for herself in three years.

Otto Wenger, association tester on the Aitken farm, has found that Mr. Helms, who is manager of the Aitken farm and also owns a pure-bred herd of his own, did in his first venture in pure-breds buy one cow which paid for herself in three years. Below is the story of the performance of this cow.

Mr. Helms purchased Queen Vale Mercedes Burke De Kol five years ago when she was three years of age, and since that time she has produced four daughters and one son, and she also has two grandsons and five granddaughters.

He sold the son when he was one year old for a sum equal to the purchase price of the original cow and also sold two daughters and two

QUEEN VALE MERCEDES BURKE DE KOL

grandsons, making a total of $905 received from the sale of offspring from this one cow. Two daughters and five granddaughters are still retained in the herd.

Queen Vale Mercedes Burke De Kol produced under semi-official work 23,225 lbs. of milk containing 655 lbs. fat in one year. She was the leading cow in milk production in Genesee No. 3 C. T. A. for the year 1923.

All of her daughters to freshen have made short and long time official records. One daughter, Mary Jane Segis De Kol, at the age of 3 years being the leading cow of all classes in butterfat for the year 1923 in Genesee No. 3 C. T. A., produced 17,874 lbs. milk with 551.5 lbs. fat.

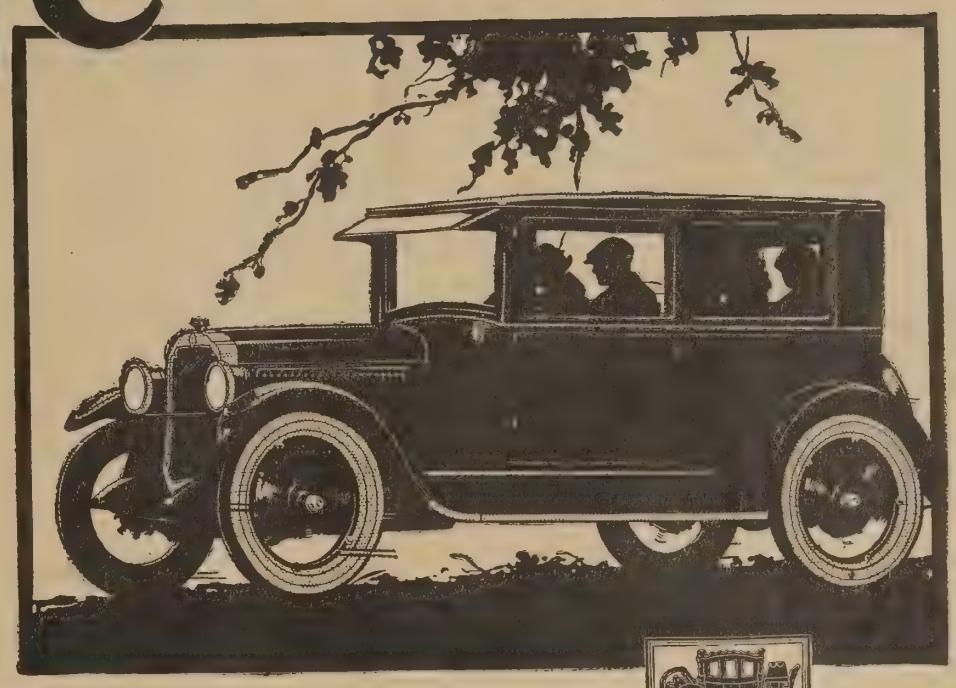
Another daughter, White Mag Mercedes Pietertje, was the leading cow of the two-year-old class in Genesee No. 3 C. T. A. for the past year, having a record of 15,225.9 lbs. milk and 505.3 lbs. fat in 365 days. She also has a 21-lb. 7-day record.

The two daughters mentioned above and the five granddaughters still owned by Mr. Helms are from sires up to and above 1,200 lbs. of butter in one year, one being sired by Maplecrest Korndyke Hengerveld, Mr. Aitken's famous old century sire, and two by Prairie Maid Prilly Lad, a bull of real merit having a 1,200-lb. dam and a 1,100-lb. sire, owned by Mr. William McCully, Dr. A. Z. Nichols, and Mrs. Clement of Hillsdale. This bull, his owners will tell you, proves the virtue of groups of farmers buying a sire together, thus making it possible for them to have the use of an exceptional sire.

Michigan. OTTO WENGER.

Edgerstoune Ayrshire Wins Silver Medal

One, two, three, four, and Nether Craig Bright Jean makes the fifth straight silver medal winning for the daughters of Hobsland Lucky Boy at Edgerstoune Farm, New Jersey. "Bright Jean", as a junior three-year-old, in 300 days has produced 11,696 lbs. milk, 505.55 lbs. fat; dropping a living calf which was carried 202 days of the test period. She becomes the fifth highest Ayrshire of her age in the Roll of Honor, thus qualifying as a silver medal cow. As a two-year-old at the 1923 Boston Show, Eastern States Exposition, and the National Dairy Exposition, she stood first, third, and fourth respectively.



The "Lucky Boys" during the past few years have been consistent winners in the show ring in Scotland and America. Of the get of Hobsland Lucky Boy, six sons and fourteen daughters are recorded on the Ayrshire Breeders' Association files as prize winners. Included in the winnings are four grand championships, one reserve champion, one junior champion, and twenty-four firsts. Among these is last year's National grand championship on bulls won by Hobsland Lucky Star.

Coupled with this outstanding showyard record is the performance of Lucky Boy's first five daughters tested in America, all tested with first calf. All silver medal winners!

The average production of these five sisters with first calf is 12,989 lbs. milk, 526.31 lbs. fat. Separating the Roll of Honor and the Advanced Registry records the averages are more comparable due to the difference in length of test period. Three Roll of Honor (300 days, with calf) records average 11,680 lbs. milk, 472.37 lbs. fat. Two Advanced Registry (365 days) records average 14,952 lbs. milk, 607.21 lbs. fat.

These five Ayrshire cows have all been tested at Edgerstoune Farm.—Ayrshire Breeders' Association, Vermont.

New

You'll hardly believe you can buy this *Fisher-Built*

COACH for $1065

f. o. b. factory

Why face another winter without a closed car? Price is no longer an argument! Not when you can buy a Coach like this for only $1065

—and buy it on the easiest monthly payment plan ever devised!

Come in and see this Coach! It's *new*—it's *different!* Its body is built by Fisher—with a hardwood frame, steel-paneled from floor to roof! New V.V. one-piece ventilating windshield, with automatic cleaner!

Rich satin Duco finish, *much more beautiful than paint*—deep cushions—plenty of room for five adults—extra wide doors!

It has a wonderful L-HEAD SIX CYLINDER ENGINE with Delco electrical equipment—Harrison radiator—a positive pressure feed lubrication and dry disc clutch.

And underlying all these things—a time-tested and time-proved *chassis built to endure for years.*

EDITORIAL COMMENT

A. D. LYNCH, director of the dairy marketing department of the Illinois Agricultural Association, hits the farmer who keep poor cows when he says: "The farmer who has cows not worth the milking, and who sells milk from such animals in competition with that of efficient cows, is guilty of unfair trade practice and is largely responsible for the present surplus of dairy products. Dairymen who flood the market with milk of 'boarder cows' are unfair and unwise business men because they cut prices for other producers in addition to their own self-inflicted personal loss."

THE WILL TO CO-OPERATE

G. Harold Powell, formerly general manager of the California Fruit Growers' Exchange, has said of co-operative marketing organizations: "A co-operative organization, if it is to be permanently successful, must grow out of economic necessity and must crystallize around a specific economic question. The reason for its existence must lie in some vital service which it is able to perform if it is to have strength enough to live in the face of the competition to which it will be instantly subjected. It will have to compete with existing organizations and this competition will be directed towards its elimination.

"The co-operative spirit must grow slowly. It is, in fact, a point of view, and the farmer acquires it as a permanent conviction only when it comes to him, step by step, out of the abundance of his own experience. Fairness, the absence of jealousy, mutual confidence, and loyalty are fundamentals in successful co-operation—and the will to co-operate must dominate the membership."

IMPROVING SWISS CHEESE

The Bureau of Dairying some years ago undertook to perfect a plan of manufacturing Swiss cheese. Various cultures were studied for the purpose of determining if it were not possible through science to develop a more accurate process of manufacturing Swiss cheese than is being so generally followed. The heavy losses sustained by producing more seconds than firsts, and even lower grades than seconds, inflicted heavy losses upon the Swiss cheese industry.

A considerable number of Swiss cheese factories are now using this new process of manufacture and are obtaining better results than under the old process of making Swiss cheese. There are so many conditions confronting the Swiss cheese maker that the process has not worked out so it is one hundred per cent accurate, but it has been the means, when properly used, of increasing the percentage of high quality cheese made.

In this year's National Dairy Exposition the first prize Swiss cheese was manufactured by using modern cultures and from clarified and standardized milk. This first prize cheese scored 98, which is exceptionally high. We cannot reasonably expect that all cheese manufacturers, even by cultures, will score this much, but we do believe through the use of cultures and this improved system of making Swiss cheese, there will be a higher percentage of first quality product. This will mean a return to the Swiss cheese industry of many dollars and will lead to an increased consumption of Swiss cheese.

DAIRY BIGGEST INDUSTRY

K. L. Hatch of the Wisconsin College of Agriculture made the following statement before the National Dairy Cattlemen's Conference held in Milwaukee October 1:

"Let it be understood at the outset that there is no uncertainty about the future of the dairy industry. It is the biggest business in America today involving more capital, more manufacturing plants, more human units, than any other single industry. The returns from this industry to the farmers alone who are engaged in it, amount to more than two and one-half billion dollars a year. When we take into consideration the capital involved in farm investment, in cattle and barns, in factories and plants, in machinery and equipment, and apportion these between the various farm and industrial enterprises involved, it soon becomes apparent that dairying is easily the nation's paramount business."

Since it has been so closely demonstrated by scientists everywhere that good milk is essential in the diet of human beings, it fixes for all time the permanency of the dairy industry. It has been known for ages that milk is an important food, but we did not have a flood of testimony from scientific sources to prove just how essential it is. Not only is milk an important food, but the crops grown for the nourishment of cattle, such as alfalfa, clover, and legumes of all kinds, are great soil builders. We have then two outstanding factors—milk, an indispensable food for all mankind, and a group of plants essential to building a permanent system of agriculture. Put in another way, we have milk to nourish our bodies properly and legumes to feed properly our soils. Is it any wonder that the dairy cow fills such an important part in the welfare of the nation?

URGES LARGER CONSUMPTION OF MILK

In a recent address before the American Dairy Federation, Dr. Lee K. Frankel, vice-president of the Metropolitan Life Insurance Company, in substance said:

"Milk is the most important single food in the dietary and no other food contains so much nourishing substances. Milk is particularly rich in lime and the deficiency of lime in the human body is responsible for many diseases."

Dr. Frankel stressed the importance of advertising the food value of milk. We believe the dairy industry should fully understand what this big company is doing in teaching the people of the nation to consume more dairy products.

Some months ago we gave mention to this company carrying on a national advertising compaign in behalf of the food value of milk. This campaign was carried on for business reasons, as the Metropolitan Insurance Co. is satisfied that people who consume dairy products are healthier and will live longer than those who eat sparingly of, or do not eat any, dairy products.

Dr. Frankel informed his dairy audience that he was looking for more information concerning the food value of milk to supply his 20,000 agents who are visiting two and one-half millions homes a year. What a mighty force is 20,000 men for advancing the use of dairy products! This should be a challenge to the dairy farmers everywhere throughout our broad land and lead them to produce nothing but high quality milk. It is a remarkable testimony to milk when an outstanding company will spend thousands of dollars attempting to teach its policy holders to consume more milk.

MANY FEEDS FOR HOGS

Recent investigations show that the combination of certain feeds for cows or hogs or other types of farm animals is an important matter for the feeder's consideration. It is possible to combine two feeds that do not supplement each other well and have poor results. On the other hand, we know that a combination of certain feeds is advantageous. One seems to help the other, or at least provides the elements of nutrition which one feed or two feeds may lack.

For instance, it has been found at the Wisconsin Experiment Station, and reported by Professor F. B. Morrison, that a ration containing yellow corn, tankage, linseed meal, and chopped alfalfa hay is more efficient than corn and tankage. Hogs receiving corn and tankage gained less than a pound per day, while those receiving yellow corn, tankage, linseed meal, and chopped alfalfa gained 1.15 pounds. As Professor Morrison has stated, this difference in daily gain means that the pigs fed this new ration reached the market rate of 200 pounds in 29 days before those fed the old ration of corn and tankage. Feeding this combination, therefore, saved one month's labor in feeding and caring for the pigs and also the feed bill for one month.

We still have men who think that corn is about all the hog requires to produce proper gains. Corn and skimmilk, when fed at the rate of 3 pounds of skimmilk to one pound of corn, provide a most excellent combination. A little corn, skimmilk, and alfalfa hay provide a good ration for brood sows. In short, it has been found in recent years that the pig will utilize several feeds and make better gains than when limited to but one or two kinds. Alfalfa is valuable for the hog because it supplies mineral matter in abundance, and we have learned in the past few years that mineral substances play a greater part in economic gains than we anticipated.

BREEDING FOR TRUE DAIRY TYPE

Slowly but surely is the human mind evolving more accurate and definite ideas concerning the right breeding of dairy cattle. One writer puts the question as follows:

"We must constantly and unceasingly breed for our best conception of the dairy type and form."

It is a good statement and sensible. Men do not see things alike. They do not have the same concept of the dairy form. There will be differences of ideas and as a consequence they will breed these differences into their cattle. Such is the diversity that Nature is constantly establishing.

But in the main a nearer approach is had to the great central truth of form, if we follow the writer's idea—breed to "our best conception of the dairy type and form". If we do our best, breed to the best, select the best, then reinforce by bestowing our best care and feed, we will constantly come nearer to perfection.

Some men are only breed breeders. Be it Holsteins or Jerseys, Guernseys or Ayrshires, they can see nothing but the perpetuation of the breed. They are simply breed partisans. The breed covers everything, is everything to them. There is no well grounded plan or system of action with such men. They are blindly doing the work of the blind.

But the problem means more than breed to the true breeder. What he is after is a knowledge of principles, those somewhat hidden and ever mysterious laws, whereby the greatest harmony and adaptability of form to purpose may be secured. Two things he sees clearly: (1) That the dairy purpose or function can be enlarged and established by a wise system of procreation. (2) That as that function becomes more perfectly established, the more clearly defined becomes the dairy form. In the main, and by a large majority, does this hold good in all breeds of dairy cattle. But in between these two great landmarks lies a territory still full of mystery and misunderstanding, full of all manner of foolish notions and unwise conceits.

If breeders of dairy cattle would become better students of the physiology of the dairy function and see more clearly than they do the intimate connection between type and form, and the best expression of the desired function, we believe there would be fewer failures in the breeding of dairy cattle.

All any breeder can hope to do in his short life is to produce a high average in his cattle. It is the bull that will beget the largest number of high average cows that he should strive to produce. There should be no aim to produce phenomenal cows. If they come, so be it, but it is too much a game of hazard.

Three hundred pounds of fat a year per cow is still a very high average in the breeding herds of dairy cattle in this or any other country.

We must fasten our eye more steadfastly on the question of the true dairy type and form and be guided by the laws and conditions that govern in this realm.

Questions Concerning the European Corn Borer

One of the most important insect pests in Ohio at the present time is the European corn borer. Recognizing it as a major pest, the Department of Entomology began work in the spring of 1923, hence our studies of the insect have extended over one season only. In the light of the information thus gained, as well as that obtained from other sources, the writers answer some of the questions commonly asked by corn growers.

What is the European corn borer? It is an insect that prefers to feed on corn. It eats practically any part of the corn plant above ground, but more particularly the pith of the stalks. It will probably prove to be the most destructive corn insect.

Where did the European corn borer come from? Europe is the native home of this insect. It was introduced into North America through commercial agencies. The first borers brought into the United States are thought to have been in broom corn imported for manufacturing purposes.

When did the insect come? The European corn borer was first found in the United States in 1916. In 1920 severe losses occurred in Canada. The following year (1921) the insect was discovered in Ohio. Without doubt the original infestation in Ohio came from moths, which, aided by favorable winds, flew across Lake Erie from Canada.

How rapidly is the insect spreading in Ohio? Due to the co-operation of the Federal Bureau of Entomology, we have definite knowledge that the pest is spreading.

Is the infestation becoming more severe? The maximum infestation found in Ohio in 1922 was one per cent, or one plant in one hundred. The maximum found in 1923 was seventeen per cent. Without question the insect increased enormously in numbers during the last season.

How does the European corn borer spread? This pest spreads by natural flight of the moths and by artificial means. The spread by natural flight can not be checked. The spread by artificial means, such as the transportation of infested corn by automobiles, wagons, etc., is checked by quarantine measures. The efficiency of quarantine measures is, of course, largely proportional to the co-operation by the public.

Where does the heaviest infestation occur in Ohio? The most severe infestation in Ohio was found by federal workers in Lucas County just east of Toledo.

Is the insect doing commercial damage in Ohio? No commercial losses have resulted. The average infestation in the infested territory is still less than one per cent.

How does this pest injure the corn? We have already said that it feeds on all parts of the plant above ground. Its chief injury, however, is generally the result of its feeding upon the pith of the stalk and shank or in the ear. If the borers are sufficiently numerous, the pith may be almost entirely consumed, thus leaving the stalk practically hollow. As a result, the food supply of the ear is not only cut off, but the stalk is likely to be broken over by winds. In either case there is a loss If the food supply is cut off, the ear will be more or less chaffy. Should the stalk be broken over, the ear and perhaps the whole stalk will lie on the ground where they will tend to spoil or decay In sweet corn grown for the market the presence of worms or larvae under and in the husks or in the cobs makes the ears unsalable.

Will the European corn borer stop the growing of corn? No. However, it is safe to predict that it will reduce the yield and perhaps the acreage. The communities or counties that follow the recommended control measures most intelligently will suffer least.

Where do the borers come from and how do they get into the corn? The moths appear in the corn fields about the middle of June. Each female lays 300 to 400 eggs. The eggs hatch in about a week. The young worms or larvae begin to feed at first upon the leaves and tassel, but later they begin to bore into the stalk. These larvae continue to feed through July, August, and September, and at the end of this period have become full grown. The larvae live in the cornstalks all the winter, even zero weather apparently does not affect them. About the first week of June they change to the pupal stage while still in the stalk. In a week or ten days the moths emerge from the pupal case and crawl out of the stalk to begin a new generation. In Northern Ohio there is only one generation in a year.

Does the European corn borer feed on other plants? In Massachusetts, where there are two generations a year, this insect has more than 200 food plants. In Ohio it has been found feeding on ragweed, pigweed, and smartweed. Undoubtedly other plants will be recorded next season.

What aid may we expect from its natural enemies? We have no reason to expect any appreciable aid from birds and native insect parasites. The latter parasitized less than two per cent in 1923. Imported parasites will be introduced in 1924.

What insects are most often confused with the European corn borer? The corn ear worm and the common stalk borer are most commonly mistaken for the European corn borer. When in doubt as to the identity of a corn insect, send specimens to the Department of Entomology, but this material should always be killed by dropping it into boiling water for a few seconds or into denatured alcohol. Living larvae must not be sent through the mail.

What control measures are advised? Let it be remembered that control measures now advised are only tentative. At present the most important recommendations for Ohio are as follows:

If all the corn fodder in Ohio could be shredded or made into ensilage, the corn borer problem would be greatly simplified. Those who follow these practices will do well to continue them.

It has been found that if infested stalks are plowed under in the late fall the borers will perish. Those who find it possible to employ this method should do so. For the greater part of Ohio, however, it will prove impractical with present farm practices.

At the present time it is apparent that the most practical as well as the most efficient measure is burning the stalks. Stalks left in the field, refuse stalks around feed lots, etc., should be burned. When? Before June 1. Why? To destroy the borers before they become moths and thus escape. Or, better still, this burning should be done at a time designated by men in charge of clean-up campaigns.

Investigation in Ohio has shown that a great many borers are left in the stubble in the field. It has been further observed that the longer the stubble the more borers they will contain. Fully 20 per cent of the infested stalks have borers in a 24-inch stubble, whereas only 8 per cent are in a six-inch stubble. The communities that cut corn the lowest and that burn the greatest percentage of the refuse stalks and fodder will suffer least from corn borer damage.

How can corn growers aid in the fight? The corn growers can aid most by keeping themselves intelligently informed concerning the true status of the insect. Efficiency in control will demand county wide co-operation. All growers should be ready to respond at the proper time.—Ohio Experiment Station.

Alfalfa and Sweet Clover Win

A farm management study of southwestern Minnesota farms by Willim L. Cavert and G. A. Pond of the Minnesota Agricultural College brought out the great economic importance of alfalfa for hay and sweet clover for pasture to the dairy farmer. Bulletin No. 89, Agricultural Extension Division, gives the information which is based largely on cost records for the years 1920 to 1923, inclusive, on the average of twenty-two representative farms in Cottonwood and Jackson Counties. The bulletin has the following to say about alfalfa and sweet clover:

"Alfalfa hay has long been known to be one of the very best kinds. In this region the cost of a ton of alfalfa hay was $5.70 and of clover and timothy hay, $8.36. The average yield was 2.2 tons of alfalfa hay and 1.1 ton of clover and timothy. Sweet clover is by far the most productive pasture crop for the region and promises greatly to improve the opportunities for profitable cattle production."

"Whatever the type of cattle produced, two of the chief handicaps in this section of the state have been the lack of high quality legume hay, clover or alfalfa, and a good pasture. However, in recent years it has been found that Grimm alfalfa thrives exceedingly well in this region. Cost records show that alfalfa is both the cheapest hay to produce on a per ton basis and also the most valuable for feed. In addition to the hay, some farms obtain hog pasture from the alfalfa so that the actual net cost is somewhat less than the figure given. At present more than half of the farms of a statistical route depend in part on alfalfa for their hay and the acreage is being rapidly increased. The lack of an abundance of good pasture has been, perhaps, as much of a handicap to profitable cattle production as the lack of a high quality hay. Here and there farmers have discovered that sweet clover, which formerly was feared as a weed because of the luxuriance with which it grew along the roadside and railroads, is one of the most valuable pasture grasses. Fortunately, in most places in central and western Minnesota the soil is abundantly supplied with the necessary element—limestone.

Bad Flavor in Milk

I have been having a lot of trouble all summer with undesirable flavor and odor in milk. The taste is bitter, there is an odor to it, and the cream seems to be sort of coagulated but not ropy. This has occurred at different times when pasture would get short and then would clear up when the cows were turned into fresh pasture. Could it be possible that bacteria are the cause or is it some weed? We took sample tests from each cow and all were affected except a new cow we purchased a month ago. Quite a little sorrel and some mare's tail weeds grew in the pasture but no more than in neighbor's pasture.

Indiana. H. C. M.

The varieties of undesirable flavors and odors in milk may be attributed to one or more of the following causes:

1. The internal or physical condition of the individual cow.
2. Absorption within the body of the cow from highly flavored feeds.
3. Absorption into the milk after production.
4. Bacterial development within the milk on standing.

The fact that all of the cows gave the objectionable flavor and odor at times would tend to eliminate the first cause given as the source of the trouble.

If the milk is handled in a clean, sanitary way from the time it is drawn until it is used, the third and fourth causes could be eliminated. This would involve, however, careful habits of milking, clean, pure air in the barns, milk utensils that are really clean, removing the milk from the barn immediately after it is drawn, possibly aerating it, and either cooling it to 50° F. or less or else pasteurizing it at 149° F. for 30 minutes and then storing it in clean containers at 50° F. or less.

The Dairy Bureau of the U. S. Department of Agriculture did some experimental work at the Beltsville, Maryland, farm which may help you to locate your trouble and which has to do with the absorption of objectionable flavors and odors within the body of the cow.

In this experiment 15 pounds of green alfalfa were fed to cows one hour before milking. Very decided objectionable flavor and odor was produced as compared to the check group. Where 30 pounds of green alfalfa were fed to cows one hour before milking there was a further increase in bad flavor and odor.

Where 15 and 30 pounds of green alfalfa were fed immediately after milking the per cent of objectionable flavor and odor was reduced to almost negligible quantity with very little difference between the two amounts of alfalfa.

Green alfalfa was fed 3 hours before milking but failed to eliminate the flavors and odor but did reduce it slightly as compared to the feeding one hour before milking. However, when the green alfalfa was fed five hours before milking the objectionable flavor and odor was almost eliminated.

Comparisons were also made between milk from the "one hour before" feeding that had been aerated over a cool surface immediately after being drawn and cooled to below 45° F. with the same kind of milk not so handled. By this method they were able to reduce the bad flavor and odor very materially.

By combining the two methods of feeding either five hours before milking or immediately after milking with aeration and cooling they produced milk of very excellent quality.

They also found that feeding 25 pounds of green corn immediately before milking produced a slight tendency to noticeable flavors and odor that was objectionable as compared with feeding the corn after milking but the difference was so slight as to be negligible.

Perhaps the only way that you can determine the source of the trouble is to check up on the methods of handling the milk and if satisfied these are right, then run a check on the cows and the feed by arranging for a non-eating period for five hours previous to milking. Some weed in the pasture may be the guilty party.

If you check up on your methods of handling the milk it will be necessary to sterilize the milk utensils to prevent possible bacterial contamination from one milking to the next. The organism that causes ropy milk will carry over in the milk utensils unless these are thoroughly sterilized.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Uniformity of Cheese Not All

HOARD'S DAIRYMAN:—I have read the article entitled "Importance of Uniform Quality of Cheese" in the October 24 number of Hoard's Dairyman. The article aureoles "loaf" cheese in general. As to the importance and desirability of uniform quality in the production of cheese, that must depend upon the standard of quality fixed. A uniform quality of cheese of low standard or of mediocre standard cannot be regarded as either meritorious or desirable. Mere uniformity regardless of the standard of quality may be more detrimental than beneficial. A troublesome fact in this affair is that we have at the present time not less than one-half dozen establishments engaged in producing processed loaf cheese, each claiming a different and superior process in its preparation. This does not spell uniformity. Moreover, there is a goodly number of cheese factories in Wisconsin that are manufacturing "loaf" cheese, employing only normal cheese making methods.

Assuming, as the article in question does, that the pasteurizing of the cheese is carried out within a few weeks of its final consumption it becomes apparent that if processed loaf cheese is "well cured", it must be because it is prepared from well cured cheese, and as you state in your editorial, there is no inconsiderable class that wants only well cured cheese, while still another class wants only slightly cured cheese. It goes without saying that no slogan of uniformity can render the same cheese both well cured and only slightly cured at the same time. The attitude of your editorial is well taken that there is a demand for variety in cheese. The article also claims that pasteurizing always brings out the defects in the cheese. Unless "brings out" is construed as drives out, this contention would seem to refute the widely heralded advertising that the processing in the production of loaf cheese makes good cheese better. So much is revealed in the article about the processes involved in preparing loaf cheese, that the wonder is why the story is left incomplete, why *all* the different kinds of material employed and their respective functions are not disclosed to the public.

It is to be hoped that in a subsequent article all the real and true facts as to the composition of processed loaf cheese will be disclosed. Will the writer of the article deny that either wittingly or unwittingly he has not named all of the constituents of processed loaf cheese?

Wisconsin. J. Q. EMERY.

Jersey Breaks Two Records With First Calf

Oregon is at the record breaking business again, this time using an imported Jersey heifer, Imp. Xenia's Oxford Lilac, to turn the trick. She was bred by Mr. J. S. Bisson of St. John's, Island of Jersey. She was imported in April, 1923, by West & Reid, and was taken across the continent to Portland, Oregon, where she was sold at auction to Harry D. Iliff for $550 on June 21. She was then trucked seventy miles to Independence, and started test on August 1, when two years and four months of age.

In the year following she produced 821.70 pounds fat and 13,122 pounds milk.

This splendid record is the highest one ever made by an Island bred Jersey in this age class, and is, in addition, the highest junior two-year-old Oregon Jersey record—American Jersey Cattle Club.

What the Master Painter used for painting the barn

ANTON RADTKE who lives four miles out of Winsted, Minn., called on his painter friend, Ernest Harper of South Minneapolis, to paint his barn.

Send for "The Farmer's Eagle" —A Guide to Farm Painting

Three hundred pounds of Eagle White Lead in Oil were used to give the barn two coats. The pleasing result is shown above.

What the picture cannot show, but what is even more important, is the durability of the protection that is given the barn by the two coats of good old fashioned white lead in oil.

The qualities that insure this and make Eagle White Lead favored by the Master Painter are developed in the slow sure Old Dutch Process. Eagle takes longer to make, but it lasts longer on the finished job.

Big Profits *in Southern Dairying*

A modern dairy, conducted in a business-like manner, will make money almost anywhere in the South. There is a big market for milk and dairy products in all the large towns and cities in the South. And the dairyman can make more money in the South because of his low "overhead". In the first place, the land costs very little. Splendid grazing lands can be obtained at remarkably low price. In the second place, the stock does not suffer severely from the cold, and the mild climate permits food stuffs to be grown at all seasons. Thus feeding is reduced to a minimum. The herds are healthy; the work of caring for them is reduced and low-cost farm labor is plentiful.

The L. & N. Railroad is interested in helping dairymen locate in the South, in order to help settle up the country along its track. It has no further interest in any real estate development. It will be glad to give you full information about operating conditions, transportation, markets and so forth in this territory. Write today.

THE OLD RELIABLE

HENRY C. WALLACE

IN the death of Secretary Wallace, agriculture has lost a capable and faithful friend. He was a son of "Uncle" Henry Wallace who for some years was a preacher, but poor health and a love for things rural caused him to turn his attention to agricultural journalism and at the age of 60 he established Wallaces' Farmer. He was editor of this paper for a period of twenty-one years and after his death his son, Henry C. Wallace, took his place.

Henry C. Wallace was born at Rock Island, Ill., May 11, 1866. He graduated from the Iowa State College in 1891, and from 1892 to 1894 he was professor of dairying at the Iowa State College. In 1895 he was made associate editor of Wallaces' Farmer and in 1916 became editor of that publication. President Harding appointed him Secretary of Agriculture and on March 4th, 1921, took up the duties of that office. He held this position until his death which occurred Saturday, October 25th.

Mr. Wallace was married November 24, 1887, to Miss Carrie May Brodhead and six children were born to them, three girls and three boys.

Besides devoting himself to editorial work and being Secretary of Agriculture, Mr. Wallace was a member of several farm organizations and held offices in several of them. Through these organizations he was placed in contact with the real problems of the farmer. He was reared in town and on the farm, and this gave him opportunity to know the life and work of those who live in the city and on the farm. This experience served him well, particularly when Secretary of Agriculture, for in this position he served both the farmer and the consumer.

Henry C. Wallace had an agricultural mind; he had a deep interest in all farm problems, and a keen desire to make rural life attractive and enjoyable. To gain this end farming must be given the same opportunities as are extended to all other industries and it must be made profitable. His life was directed to bringing about improvement in marketing farm products and in farm practices that would increase the farmer's income. He sought on every occasion to obtain returns for the farmer that would be in keeping with his labor and investment.

The death of Secretary Wallace is a distinct loss to the nation, for his large experience and keen understanding of farm problems made him a useful and capable servant of agriculture.

HENRY C. WALLACE

Herdsman Training Offered

The Short Course at the University of Wisconsin which opens November 17th offers excellent training for a man who wishes to specialize in live stock work. The work offered is part of a training which fits a man to become an efficient herdsman, a cow tester, or a manager of a live stock farm.

In addition to a study of the judging, feeding and care of farm animals, work in veterinary practice, farm dairying, farm bookkeeping, and other allied courses are offered.

The employment bureau of the College of Agriculture has been unable to meet the increasing demand for men who have taken the Short Course.

For further information write Short Course, College of Agriculture, Madison, Wis.

You will take pride in owning *the Reliable*

KIMBALL

whether a Piano, a Player or Phonograph

WHAT could add more to the attractiveness of your home and the entertainment of your family than one of the KIMBALL Pianos, or a Player Piano? Eminent musicians of past and present have bestowed highest praise on the Kimball.

In the rich tones of the Uprights and Grands—in the "almost human" action of the Players—and in the accurate tone-reproduction of the Phonographs the same superb quality is found; *yet the prices are wonderfully moderate*, due to the great production facilities of this 67-year-old institution.

Why be satisfied with less in quality, when the price is no more?

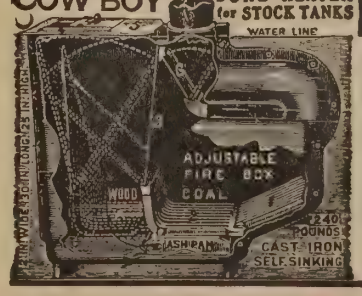
MINNETONNA-MADE BUTTER ALWAYS GETS TOP PRICES

Three to four cents over the market price of butter. That is what MINNETONNA owners get for the product of this wonderful churn and butter worker. The high quality of MINNETONNA-Made butter insures a ready market.



Pays for itself in a short time because it gives overrun (moisture and salt) of 20% to 25% and gets all of the cream from the butter milk. Eliminates labor of working butter.

Will churn 12 gallons of cream or less. Works 3 to 20 lbs. Requires ¼ H. P. motor or 1 H. P. gas engine. Hand driven if desired.

Complete directions for operating and making quality butter with each churn. Write for FREE descriptive folder.

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. ABSOLUTELY SAFE. Warm water helps digestion; saves grain.

"Purchased 8 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

Write today for illustrated circular and dealer's name.
MUNDIE MFG. COMPANY, 513 Brunner St., Peru, ILL.

For Your

Fall and Winter Feeding

With oats and hominy still high in price you can save money by feeding your dairy herd one of the following rations:

(1)		(2)	
300 lbs.	Diamond Corn Gluten Meal	400 lbs.	Buffalo Corn Gluten Feed
600 lbs.	Bran	500 lbs.	Bran
100 lbs.	Oilmeal	100 lbs.	Oilmeal
1000 lbs.	(25% Protein)	1000 lbs.	(20.6% Protein)

Feed No. 1 if your roughage is timothy or mixed hay; No. 2 if you have much clover or alfalfa. Feed a pound of either ration to 3 lbs. of milk if your cows are Jerseys or Guernseys; a pound to 4 lbs. of milk if Holsteins or Ayrshires.

Each ration is productive, economical, easy to mix, safe to feed and palatable. Each will give you as much milk for less feed cost. You can prove it by keeping records of feed consumed and milk produced.

Feeding the Dairy Calf

(Continued from page 497)

als which undoubtedly causes death. Eckles of the Minnesota Station found that water-soluble vitamin B in the form of yeast and of antiscorbutic vitamin C in the form of orange juice was without effect when calves were fed a sole diet of milk. However, the addition of calcium carbonate appeared to relieve the abnormal condition within a short time.

Vitamins for Calves

In a discussion of the various factors which must be considered in preparing a balanced ration for growth and milk production, the importance of the vitamins was pointed out. Whole milk has been found to be a balanced food for growth as would be expected from the fact that it is the natural food for young animals. When skimmilk or other substitutes are fed in the place of milk, the question arises as to the vitamins supplied in the substitutes. Fortunately, the leguminous roughages contain an abundance of the vitamins found in milk fat and can take the place of the valuable fat as soon as the calves will eat hay and grain. Feeds low in fat soluble vitamin A, such as skimmilk, whey, white corn, and linseed meal when supplemented with alfalfa hay, have proven entirely satisfactory. Water soluble vitamin B is present in sufficient amount both in roughages and grains. That an abundance of this vitamin is present in ordinary rations, was demonstrated in an experiment at the Minnesota Station. One-half of the pure-bred calves born in the dairy herd received yeast (rich in vitamin B) daily until six months old and were compared in growth and health to the others. No difference between the two groups could be seen.

Bone development in growing animals would undoubtedly be aided by the presence of vitamin D which assists in the assimilation of calcium and phosphorus. This vitamin is found in abundance in leguminous hay properly cured and pasture grass. If other types of roughages which are low in calcium or phosphorus are fed, one-half ounce daily of bone meal, ground rock phosphate, wood ashes, slacked lime, or chalk should be fed. Salt and water at will should never be neglected.

Changing to Skimmilk

As soon as the calves are able to eat hay containing the vitamins, the whole milk may gradually be replaced by skimmilk at the rate of one pound per day. This substitution can usually be completed by the time the calf is three or four weeks old. If during the gradual change to skimmilk the calf goes off feed or scours, the feed should be reduced and no further change made until back to normal. Slightly larger gains can be made with whole milk as shown in trials at the Kansas and Indiana Stations, but the butterfat is too valuable to feed under ordinary conditions. To keep the "bloom" on show calves, they are often fed whole milk until one year of age or more.

As fat is an energy feed, the skimmilk should be supplemented with carbonaceous or energy feeds rather than high protein feeds. The following comparison between the composition of whole milk and skimmilk emphasizes the fact that additional protein feeds are not required:

	Whole milk %	Skimmilk %
Water	87.10	90.50
Fat	3.90	0.10
Protein	3.40	3.57
Sugar	4.75	4.95
Ash	0.75	0.78

Early investigators tried to substitute liquid fats for butterfat but the superiority of these calves over calves fed grains was not sufficient to warrant the use of comparatively high priced fats or oils.

Experiments have shown that the farm grown grains are excellent supplements to skimmilk. Ground oats and corn meal were fed at the Iowa Station, kafir meal at the Kansas Station, and barley at the Virginia Station with good results. Ground carob pods as well as beet pulp were fed successfully at the California Station, to supplement skimmilk. The choice of grains will depend upon the market price. It has been shown at the Nebraska Station that when skimmilk is fed liberally during the first six months that light feeding of either corn or mixed grains with alfalfa hay produces as good gains in weight as those fed more liberally.

As weaning time approaches, the corn or other grain should be supplemented with other feeds such as oats, wheat bran, and linseed meal. A very popular grain mixture for calves and heifers consists of corn meal 3 parts, ground oats 3 parts, wheat bran 1 part, linseed meal 1 part.

The Iowa Station recommends the following mixtures: Corn 5 parts, oats or bran 3 parts, and oil meal 1 part; and oats 3 parts, bran 1 part, and oil meal 1 part.

At the Missouri Station the following grain mixture is fed: Ground corn 2 parts, whole oats 2 parts, wheat bran 1 part, oil meal 1 part. If only a limited amount of skimmilk is available one of the mixtures containing considerable protein may well be fed to supplement the milk.

Self-feeders for Calves

The free choice system of feeding swine which has been found successful, does not appear to be adapted to calf feeding. In a trial by McCandlish of the Iowa Station, self-fed calves showed a preference for unground grains but consumed a ration containing a large amount of oil meal. The nutritive ratio 1:3.5 is narrower than that recommended by the feeding standards.

Nevens at the Nebraska Station also tried the self-feeder. In addition to the grain, two parts of alfalfa meal were added to the mixture to increase the bulk when the calves were three months old. Skimmilk and alfalfa hay were fed in addition. While the self-fed calves consumed large amounts of feed, the average daily gain was 2.34 pounds. It is believed that by properly mixing grain with alfalfa meal or other cut roughages, calves could be grown to maturity at a minimum labor cost, a reasonable feed cost, and without any injury to the dairy qualities of the calves.

Sour Milk

While it has been thought that sour milk will produce indigestion, trials by Woodward of the U. S. Dairy Division indicate that this is not true. He states that in no case did rapidly soured milk cause digestive disturbances, even when the change from the sweet to sour was made abruptly and with calves only a few days old. While it is not as palatable as sweet milk, good gains were made. He concludes that dairymen might just as well let the milk for calf feeding become sour during the summer months instead of going to the trouble and expense to keep it sweet. While milk soured by pure lactic acid bacteria is probably not harmful, the possibility of dangerous types of bacteria developing at the same time makes the practice questionable.

Eckles points out the importance of feeding either sweet or sour milk and not sweet milk one day and sour milk

the next as young calves are sensitive to violent changes.

Pasteurized Skimmilk

When skimmilk is obtained from creameries, it should be pasteurized to kill all disease-producing bacteria. This precaution will lessen the danger of spreading tuberculosis and also infectious scours among calves. Feeding trials have shown that pasteurized skimmilk is equal to unpasteurized skimmilk for calves.

Dry Skimmilk and Semi-solid Buttermilk

Dried skimmilk powder when dissolved in nine parts of water forms a product which has been found equal to skimmilk for calf feeding. It is rather expensive and sometimes difficult to obtain in small lots. As compared to feeding whole milk, skimmilk powder will make 100 pounds of feed at about one-half the farm price of the former.

Condensed or semi-solid buttermilk has also proven successful as a skimmilk substitute. Woodward of the Washington Station fed from 1.25 pounds at three weeks to 4 pounds at three months diluted in warm water at the rate of five pounds at a feeding regardless of the quantity of condensed buttermilk dissolved in it.

Whey

Whey is low in protein but contains considerable milk sugar which is of value. Humphrey at the Wisconsin Station recommends that if whey is used for calf raising, it should be sweet and clean and fed at about the temperature of freshly drawn milk. Each patron of a cheese factory should have special cans and have them filled directly from the cheese vat. It should be fed only after the calf has been well started on whole milk.

Otis of the Kansas Station compared whey with skimmilk as a feed for calves. In the early trials the whey-fed calves gained very poorly. Later by replacing alfalfa for prairie hay and using a grain mixture composed of kafir corn and sifted oats, thrifty, healthy calves were raised. It appears that success in using whey will result by the careful selection of supplementary feeds.

Oil meal or other high protein feeds are needed in the grain mixture to supplement whey due to the low protein content.

Diluted Whole Milk

At the Connecticut Station, White and Kuelling compared the value of whole milk diluted with water and skimmilk. The milk was diluted with 75% of water. They conclude that while diluted whole milk proved more expensive than skimmilk, the gains were produced at a price low enough to warrant the practice on farms where whole milk is sold since it eliminated the investment in a separator.

Miscellaneous Feeds

Molasses. The feeding of blackstrap molasses to young calves was tried by Calloway of the Louisiana Station. The molasses was fed on the grain as soon as the calves would begin to take grain—one or two ounces at each feed. The molasses was gradually increased until at six months of age two pounds were being fed. It was found that sugar-cane blackstrap, except in excess, was not laxative when fed with grain. It is nutritious, a good appetizer, and tends to make the grain more palatable.

Silage. The desirability of feeding corn silage to dairy calves at an early age was tried by White and Kuelling of the Connecticut Station. The calves were allowed silage as soon as they would eat it. They conclude that feeding silage before two or three months of age is not desirable as it widens the ration and increases the chance of scouring. Later, silage was relished and forms a good feed for calves.

Cottonseed Meal. Due to the toxic or poisonous properties of cottonseed meal it cannot be fed safely to calves until they are six or eight months old. It may then be gradually fed up to two pounds per day. Other protein concentrates such as linseed meal are to be preferred, however.

Feeding Whole Grain. An experiment conducted at the Michigan Station by Shaw and Norton shows that it is not necessary to grind grain for calves. The following table shows the small amount of grain which passed through the digestive tract of the calf as compared to that passing through the digestive tract of heifers and cows:

Proportion of Grain Eaten Recovered in Feces

	Whole corn recovered	Whole oats recovered	Equal parts whole corn and oats recovered
	%	%	%
Cows	22.76	12.06	26.45
Heifers	10.77	5.48	17.50
Calves	6.28	2.98	5.78

That calves prefer whole grain to ground grain was also shown in a study by McCandlish of the Iowa Station. He offered corn both whole and cracked and oats both whole and ground in a study of the "free choice" system as applied to calves. Very little of the ground corn or oats were eaten. Another manifestation of an aversion

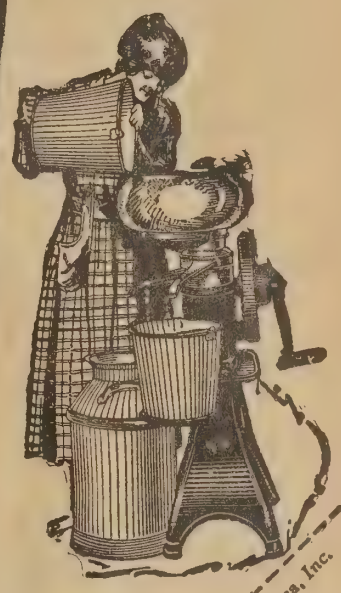
12 Full Months to Pay
—and You Don't Have to Pay Much

You can buy a McCormick-Deering BALL-BEARING Primrose Cream Separator from the local McCormick-Deering dealer at an ATTRACTIVE price. He will deliver the World's Easiest-Running Cream Separator to you, set it up and adjust it, and give you 12 FULL MONTHS TO PAY for it. You may use the machine, put it to any test you care to, and compare it with any cream separator you ever saw or owned. We know you will like it.

Manufactured and Guaranteed by the Largest Manufacturer of Dairy Farm Equipment



Ask your local dealer to demonstrate this easy-running, close-skimming, long-lived BALL-BEARING machine to you. Even if ready cash is not plentiful, you need not hesitate. Pick out your McCormick-Deering Primrose (there are five sizes), then ask the dealer for his liberal terms—you have 12 Full Months to Pay!

"Our Cream Checks Have Increased on an Average of $2.30 per Week"

writes one recent purchaser of a McCormick-Deering Primrose. His experience is typical. Think of it! The machine pays for itself in the butterfat it saves. You cannot afford to be without the convenience and economy of the World's Easiest-Running Cream Separator. Talk to your local dealer, or mail the coupon today.

AND WATER SYSTEMS

Goulds "Pyramid" Water Supply System. Electric driven. Capacities 480 to 1260 gallons per hour

For Large suburban and Country Homes, Schools, Country Clubs, Factories, Country Estates, Office Buildings, Truck Farms, Greenhouses, Dairies,

There's Only One Satisfactory Way To Water Stock

The dairy farmer without an adequate supply of running water is fighting a losing battle.

The first cost of a Goulds water system is surprisingly low when compared to the saving it effects in time and labor over "hand pumping" or other inadequate water supply.

Goulds service specializes in individual requirements for the farm and country home. Goulds Pumps and Water Systems come in various types, sizes and capacities to meet every need for farm buildings, stock watering, house use or grounds.

Don't fail to communicate with Goulds or a Goulds dealer if you want a modern satisfactory water supply.

Write for booklet giving details of our complete line of electric and engine driven pumps and water systems for every need.

When Writing to Advertisers, Please Mention Hoard's Dairyman

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

WASHINGTON, D. C., OCT. 28—The unexpected taking away of Secretary Henry C. Wallace has left a feeling of profound regret and sadness among the agricultural workers in Washington, both in and out of the Department. He was recognized as the most farmer minded man who ever sat at the head of the Department or in a President's cabinet. There is no doubt in the minds of those who knew him well—your correspondent feels that he can class himself in this group—that his death was as much a death at the post of duty as was the death of a soldier in the trenches. He gave his life to the service of the Department and its work for agriculture, and he literally gave his life for this service. His critics, there are a few, were critics of minor details of administration, never of the sincerity of his mind or his heart and their relationship to his work. If there is an exception to this statement the exception of itself classes the critic as either not honest with himself, or else willingly at fault in not knowing the facts before making the criticism. The problems of the administration of the Department and the problems of personal adjustment of official relations into a somewhat discordant atmosphere in the President's cabinet, of assisting agriculture and at the same time meeting and adjusting friction from antagonistic views and antagonistic policies, were the elements of a burden which wore out the secretary's physical vigor. His death leaves a vacancy in a position, and at a time of stress, hardly less serious than when he assumed the position. The funeral Monday at the White House was very largely attended by diplomats and high government officials. Assistant Secretary Gore returned immediately to the Department and is acting secretary until an appointment is made by the President. Acting Secretary Gore, and a number of department officials, and Secretary of the Interior Work, as the personal representative of the President, accompanied Mrs. Wallace and the funeral party to Des Moines, Ia., where the services of interment were held on Wednesday.

There is much talk of the possibility of Ex-Gov. Lowden, president of the American Dairy Federation, being named as successor to Secretary Wallace. It seems to be conceded that Mr. Lowden can have the appointment if he indicates his desire for it. At the same time Washington gossip veers to several others as more likely to be named and accept, including Governor Hyde of Missouri; L. J. Taber, Master of the National Grange; Samuel Adams, former president of the Agricultural Editorial Association; W. L. Dickenson of Iowa; and some others.

Corn Disease Problems

The Illinois Agricultural Experiment Station has just recently issued a bulletin dealing with corn disease problems. The title of the bulletin is: "Corn Root, Stalk, and Ear Rot Diseases, and Their Control Through Seed Selection and Breeding."

The corn root, stalk, and ear rot diseases are a group of diseases seriously affecting the corn crop. In general most of these diseases cause a reduction in field stand, a reduction in health and vigor of surviving plants, and a reduction in both yield and quality. They may cause a yellowing of the leaves, delayed silking, and pollenation, firing, and a general blighting of the plants, lodging, barrenness, and a nubbin production in various forms. The authors feel that where inferior and infected seed is used, losses to the corn crop from disease, including smut and rust, can very conservatively be placed at 20 per cent.

The bulletin is illustrated throughout with very fine reproductions of comparisons. It will make a very valuable addition to the library of the careful student of corn culture. Write to Illinois Agricultural Experiment Station, Urbana, for Bulletin No. 255.

Missouri—Kansas Songs

On Wisconsin, On Wisconsin
With your dairy cow,
We are here to visit you, so you can tell us how.
Oklahoma, Missouri, Kansas wish you all success,
Here's a health to all your hospitality.

Holstein standing in a clover field,
And it ain't going to do no harm,
You milk her in a ten-gallon pail
To irrigate your farm.

Chorus—Oh, it ain't going to rain no more.

The Jersey cow is a cow so fine,
To give you butterfat;
But the milk she gives from morn till night
Won't feed a big tom cat.

The Guernsey cow with her yellow milk,
Is a cow that is mighty fine,
If you want to build your bank account
Get into the Guernsey line.

Tune—"It Ain't Going to Rain No More".

We've seen your barns and silos,
We've seen your skies so clear,
But tell the world we won't go home
Till we get that glass of beer.
(Tune—It Ain't Going to Rain No More.)

I'm forever boosting Holsteins,
I mean the black and white;
They look so fine, give milk sublime,
And win the ribbon every time.
My fortunes always growing
They fill the pail so full.
I'm forever boosting Holsteins,
Yes, the good old black and white.
(Tune—I'm Forever Blowing Bubbles.)

They Go Together

Willie Willis: Pop, what is a mortgage?

Mr. Willis: Oh it's something that comes with an automobile, my son.—Good Hardware.

Says Sam: Good books stir a man's mental circulation more than ever these cool fall evenings.

FERN OF GLENVILLE

Marlboro County, South Carolina, has long been considered one of the banner cotton producing counties of the South. The cotton crop was the only source of agricultural wealth in the county, and Marlboro produced more cotton than any other county of similar area. Such was the situation when the cotton boll weevil invaded the area, and it became plain that diversification was necessary if farm values were to be maintained.

In July, 1917, C. S. McCall, Marlboro Co., bought his first pure-bred Guernsey. He attended a sale at Burkeville, Va., and bought the cow, Fern of Glenville, paying $190 for her as a senior yearling.

She freshened with her second calf in January, 1920, and Mr. McCall placed her on test—the first cow he had ever tested. She made a class DD record of 8,657.3 pounds of milk and 470.49 pounds of butterfat. At the end of this test, she was started again, and finished a class B record of 12,628.2 pounds of milk and 693.67 pounds of butterfat.

With her next calf, she started so well that it was decided to give her another chance to make a good record, and the result was that Fern of Glenville has just been announced as the holder of eighth place in class AA, with a record of 15,157.6 pounds of milk and 815.62 pounds fat.—American Guernsey Cattle Club.

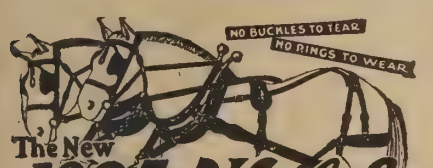
Own Your Feed Factory

Save $10 to $20 per ton

With these two wonderful new patented machines you can duplicate any high priced balanced ration mixed feed on the market and save half their cost.

The Masticator Hammer Mill is the only mill that makes fine meal of cornstalk, corn in shuck, alfalfa, pea-vines, oats, any kind of grain or any other roughage. Operated with 8 H. P. engine.

The Maclellan Batch Mixer makes a perfect mix in one minute.



We give you the best known standard formulas free. Two famous feeding experts will help you with your feeding problems. Whether you are feeding dairy cows, cattle or poultry you need this equipment.

Masticator Hammer Mill $150.00
Maclellan Batch Mixer $100.00

They are sold on trial. Will save their cost many times—every year. Write for catalogue.

Northwest Dairy Notes

HOARD'S DAIRYMAN:—The Carnation Milk Products Co. celebrated its 25th anniversary during September of this year. Founded in 1899 by Eldridge Amos Stuart, who still remains active president, the Carnation Milk Products Co. in the last quarter century has grown from a one-man concern into a vast commercial organization possessing ten condenseries on the Pacific Coast, alone.

Originally carrying the cans of milk from store to store by hand, Mr. Stuart's organization today has 34 condenseries operating in 12 states, with a distribution of nearly 1,000,000 cans daily. Recently the Carnation Milk Products Company purchased a large butter and cheese factory in France, and all its equipment and machinery.

⚜

With the establishment this year of the annual products show of Western Washington dairy products, there will be added a department to the Western Washington Fair at Puyallup that promises to become one of the biggest features in years to come.

The show this year, to be held in the new Electric Building, will be of much interest to the consumer and producer of milk, as it will set forth so that all may understand the standard system of grading and inspecting milk, cream, butter, and cheese, and to add to the novelty and attractiveness of the display will be an artistic feature that in eastern shows has drawn and held crowds for hours. Miss Alice McCookley, in a refrigerated glass studio case, will model all kinds of the daintiest and delicate flowers out of butter.

⚜

Glass lined thermos tanks of 1,500-gallon capacity are being used for the first time in the Northwest by the distributing plant of the Mayflower Dairy of Seattle, Wash. These trucks will be used in transporting milk to outlying districts. The Milk Transportation Co. of Seattle has just taken delivery of five 5-ton Whites, thus equipped. It is possible, by using this method of transportation, to move milk a distance of 300 miles and not lose over two degrees of temperature on the hottest day. In this case, however, the trucks are only covering a radius of 50 miles, so there is practically no loss of temperature between the concentration point and the distributing plant.

The tanks are made of steel, fused with glass on the inside, giving a completely glass lined interior. On the outside of this steel shell is three inches of cork insulating material, and this is held in place by a second steel shell. This construction not only assures the heat insulation that is required, but gives the tank the necessary sturdiness that is required to stand up to the shocks of the road.

The cost of each tank is $2,000, and this, compared to the cost of the $750 for tanks of a similar capacity for the distribution of oil and gasoline, gives an idea of the quality of the material used in the milk trucks.

⚜

Definite action toward construction of the dairy plant of the Yakima Dairymen's Association was brought forward at a recent meeting of the executive board. Plans for financing construction were completed. A holding company will be organized. This company will build the plant and lease it to the association under agreement for its purchase by the association. The building will cost $12,000 to $15,000. G. M. Chase and other local men are interested in the matter.

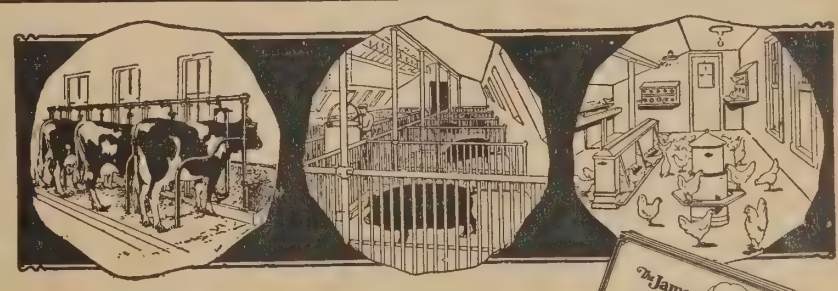
Washington. E. E. PATTERSON.

GMC

Pressure Lubrication Keeps GMC Engines Right

In addition to their many other advantages for dairy farm use, GMC Trucks offer you a better engine—longer lived.

Pressure lubrication, until lately an exclusive feature of fine passenger cars, now safeguards the operation of GMC engine surfaces—eliminates wear—saves engine repairs.



Every GMC engine bearing surface is supplied with oil under constant pressure from a simple gear pump located at the bottom of the oil pan. The bearings get oil if there is any oil at all in the crank case. You know what that means!

Pressure lubrication is a striking instance of the quality of GMC engineering and the care GMC takes to build you the most dependable truck.

You Don't Need A Pile of Money

Every Cow—Hog—Hen Farmer Can Use *JAMESWAY* Plans and Equipment

You'll be surprised at how little it costs to own and enjoy a Jamesway equipped, work-saving dairy barn, a sunny sanitary hog barn, or a comfortable, ventilated poultry house to increase your earnings. Write and get our Jamesway "Pay from Earnings" Plan on stanchions, stalls, carriers, water bowls, etc. As little as $10 to $12 per month will give you the finest dairy barn equipment you could want on this plan. And think of the increased earnings, shortened hours of labor, and a more pleasant place to work in!

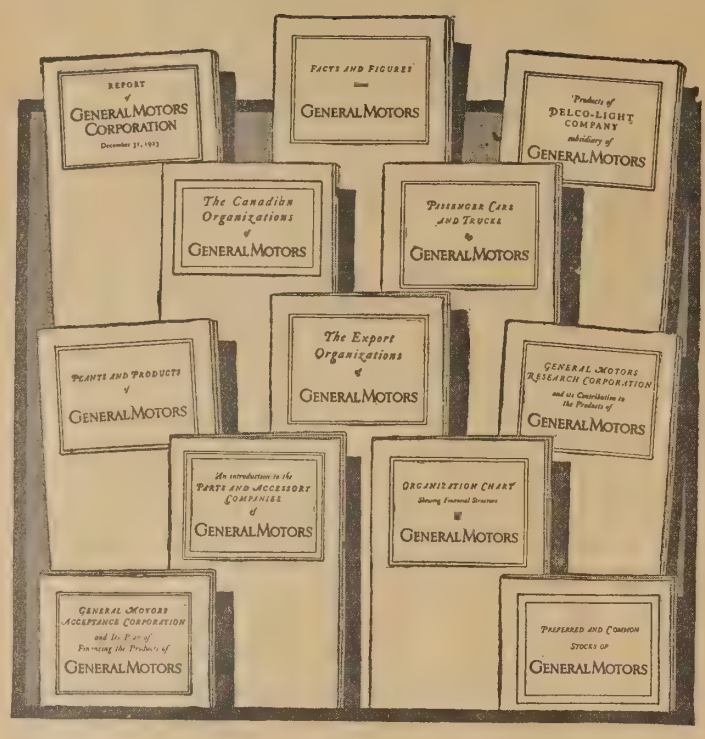
Equip your hog barn and poultry house on same plan. Think of only $6.00 or $8.00 per month and increasing your egg profits with feed saving, metal self-feeders, waterers, self-cleaning metal nests. Also complete ventilation system. Hens can't help but lay more eggs in such a poultry house.

Our New Jamesway Book Sent FREE—

will tell you how you can have these advantages. Also tells how increased earnings soon pay their cost—and yield clear profits afterwards. If building, or remodeling, be sure to get Jamesway plans first. Our local Jamesway man will be glad to call and help you. Write today and mention how many cows, hogs, chickens, etc. you keep.

This New Book Will Tell You—

How to get a good dairy barn.
How to remodel an old barn.
How to get good ventilation.
The Essentials of a Good Cow Stall.
How to give cows pasture comfort in a barn.
How to judge a stanchion.
How to feed cows for profit.
How to insure "safety first" with the bull.
How to make the cleaning job easy.
How to water your cows in the barn.
How to have better hogs and bigger litters.
How to make more money from your hens.
How Jamesway "Pay-from-Earnings" plan pays for your equipment as you use it.
And many other helpful pointers on cow, hog and hen problems.



WE SELL DIRECT TO USER

Wayside Musings — When a Baby Made The Front Page

JOSEPH S. MORRIS, WISCONSIN

AS we pick up our magazines, newspapers, or weeklies our attention is frequently called to the picture of a baby or a little child on the front or cover page. For a long, long time this would not have been considered a good front page feature, but more and more we are coming to consider the baby as the most important factor in human society and there is a reason why this is and should be so.

In the Gospel according to St. Luke, in your Bibles, the eighteenth chapter, fifteenth to seventeenth verses, we are told that the mothers were bringing their children to Jesus that He should touch them. When the disciples of Jesus observed this they rebuked the mothers. But mothers are always seeking blessings for their children and the disciples should have known that it was quite natural for those mothers to want this wonderful Man to bestow a blessing upon them. Of course, Jesus was very busy. The disciples probably felt that the mothers were imposing upon their Master by pressing about Him with their children. In the minds of these good men who were Jesus' close companions, children were of secondary importance. The main business was for Jesus to have opportunity to get his ideas and ideals to grown men so that His kingdom might grow. Jesus used the occasion to teach them a very great lesson, the lesson that children are our most valuable "assets," "for to such belongeth the kingdom of God", and "whosoever shall not receive the kingdom of God as a little child, he shall in no wise enter therein".

If there had been newspapers in those days such as we have today we should have seen on the front pages the next morning pictures showing the Great Teacher with somebody's baby in His arms bestowing His blessing upon it, and in the story it would have gone on to tell how the followers of Jesus resented the mothers pressing for attention to their babies and how the Master had rebuked them and told them that His kingdom could not come until all had learned how to be open to truth and receptive, as is a little child. I am not so sure that we have learned that lesson yet.

It was on that day in the long ago that a baby made the first page. Even though there were no newspapers it came to the attention of men that in building the good babies were of first importance. Today almost every great nation centers its attention upon babies and well they may for those who are to be the men and women of affairs twenty-five or thirty years from now are the babies of today.

Nurses and doctors advise the mother how to care for the baby when it comes. The great dairy interests provide clean and pure milk for food for babies and little children, and for all the rest of us, too, for that matter. And then as the little child grows up in the home it gets its first great lessons in love and kindness and unselfishness. Fathers and mothers plant seeds in the child's mind and heart that will bear fruit in all the years of life. And then there is the school to train and discipline the mind and the church to teach reverence, truthfulness, and brotherliness, and the colleges and universities to help in guiding to effective and efficient life. Oh, there are so many things that go into the process of developing a real man or woman that it may well be considered life's biggest job.

I think we may truthfully say that all progress in business, in agriculture, in industry, in government, in professional life depends upon the wisdom with which the early training of the child is directed. All real, big, permanent development must wait for the fitting, the training of men and women who have the ability to make better conditions prevail. Wonderful as are all the inventions and methods of life that bless our day, we need to remember that all were born in the minds and hearts of men and women. The baby, the human factor, is the greatest.

I do not believe we can think too much of our children unless in our love for them we foolishly fail to correct those faults that lead to bad, weak, or selfish characters. There isn't anything in all the world that gets hold of the human heart as does a baby. I think the great God implanted in us the instinct to love and protect our children because this is His method of improving the world. We find ourselves living again in the lives of our sons and daughters. No other gift of God can bring the thrill that comes to men and women as they hold in their arms their own lives reproduced in this wonderful being, the baby. All the world seems different and better with the coming of children. We want to build a better, happier world because we want our children to live in a better and happier world.

This is an important period in human history—the period in which babies "make the first page".

GUERNSEY COW, LONE PINE MOLLIE COWAN, BOUGHT BY WM. H. WILLIAMS, NEW YORK, FOR $15,100 AT THE RECENT HARRY L. STOUT SALE, ILLINOIS

This book is saving millions of dollars for the American people.

Are you getting your share?

Do you realize the opportunity for Saving Ward's Catalogue brings into your home?

Are you using this book?

THERE is one sure rule for saving — one sure way to make certain that the price you pay is the right price for everything you buy.

Whatever you need to buy, shoes or clothing, hardware or automobile tires, turn to your Ward Catalogue and see the price.

Use this catalogue. It can be to you a means of almost weekly saving.

500,000 more customers won by Ward's last year

We tell you that 500,000 new customers sent their orders to Ward's last year, that several million families buy their household and personal needs from Ward's Catalogue, because there is in this fact food for thought.

These millions of careful buyers find in this book a saving. They find at Ward's a service that *can be just as valuable to you.*

Ward's brings you the services of an international staff of expert buyers

Supposing you are going to buy a pair of shoes — and supposing you knew leather as well as an expert tanner — you knew the fine points of shoe making — and you had the backing of a great company and could go anywhere to get yourself the best pair of shoes the world could produce at the price you wished to pay.

That is exactly what we do for you. That is the value of Ward's service to you.

Our expert buyers search all markets with ready cash—looking for quality merchandise at the world's lowest cash prices.

We sell only goods that stand inspection and use

But we do more than search for low prices. We look for quality. We buy only merchandise that will give you satisfaction. We never sacrifice wearing quality merely to offer you a seemingly low price.

It is part of our service to you to make sure of your satisfaction with everything you buy.

Everything for the farm, the home and the family

This great merchandise book contains 726 pages of interest to men, women and children.

It shows the latest fashions, coats made in Paris by Carha and imported by us. There is everything a woman needs for her personal use, for her family and for her home. This Catalogue fully supplies the man's and the boy's needs: clothing, everything for personal use, everything for the farm and the automobile.

20 Complete
CHRISTMAS STORES
in this Catalogue

Hundreds and hundreds of the best Christmas Gifts are shown in your Ward Catalogue.

There is everything to give to every member of the family — useful gifts as well as toys, games, jewelry, and all the season's novelties.

There are no "Christmas Profits" in Ward's prices. You pay the lowest prices of the year for every gift you buy.

Let Ward's Catalogue be your Christmas shopping guide.

Your orders will be shipped within 24 hours

Your orders are appreciated at Ward's. Your letter is opened immediately, your order filled at once, and your goods are on their way to you within 24 hours.

Look through your catalogue again

You buy something almost every week. This book offers you almost a weekly saving.

So look through your Catalogue before you buy. Compare prices. And remember that in comparing prices, everything we sell is backed by our 52 year old guarantee:

She Fills the MILK PAILS *now*

Dairy cows fed GOLD MEDAL VITAMIN DAIRY RATION are breaking their previous records for milk and butter-fat production.

Because GOLD MEDAL VITAMIN DAIRY RATION is so assimilable the digestible nutrients are nearer on a parity with the guaranteed analysis than in most other dairy rations on the market. The guaranteed analysis is as follows: Crude Protein, not less than 20%; Crude Fat, not under 5%; Crude Fibre, not over 8.5%; Nitrogen Free Extract, not less than 51.5%. (Total Carbohydrates 60.0%.) Note the low fibre content—still this ration is bulky enough to insure complete digestional processes.

For maximum milk production feed GOLD MEDAL VITAMIN DAIRY RATION the year around.

GOLD MEDAL FEEDS are prepared by the millers of GOLD MEDAL FLOUR with the same quality guarantee.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets dull with trading in small volume for week ending Oct. 25th. Buyers see no prospects of advance and have held to immediate requirements. More interest in held cheese although in some markets it was necessary to sell at prices pretty well in line with fresh goods. Production heavy for season.

The average wholesale prices on American cheese, style Twins, for the week ending Oct. 25, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Oct. 25 1924	Oct. 18 1924	Oct. 25 1923
	Cts.	Cts.	Cts.
New York	20.0	20.0	25.7
Chicago	18.1	18.8	23.8
Boston	21.0	21.3	26.7
San Francisco	19.2	19.2	25.7
Wisconsin Boards	17.6	18.6	24.6

The receipts of cheese at these markets were 4,058,158 lbs. for the week as compared with 2,869,947 lbs. last week and 4,501,251 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets opened the week ending October 25 in an unsettled condition, but recovered toward the close with prices practically back to the previous week's level. Weakening factors were heavy production and the lack of demand for heavy holdings of storage butter. Support at close principally due to scarcity of top grades. Some export business although slight.

The average wholesale prices on 92-score butter for the week ending Oct. 25, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Oct. 25 1924	Oct. 18 1924	Oct. 25 1923
	Cts.	Cts.	Cts.
New York	37.7	39.0	48.2
Chicago	36.7	37.5	47.0
Philadelphia	38.2	39.5	49.0
Boston	37.5	38.8	48.0
San Francisco	38.2	39.1	46.2

The receipts of butter at these markets were 10,202,378 lbs. for the week as compared with 9,637,896 lbs. for last week and 9,232,096 lbs. a year ago.

Wisconsin October Condensery Prices

(Wisconsin Department of Markets)

The following table gives the prices paid for milk delivered at the plants listed below. Hauling charges must be deducted from these prices if prices for milk on the farm are desired. Some of the plants in the list are not strictly condenseries as they make a practice of bottling part or nearly all of their milk and prices paid by such plants usually run higher than those paid by straight condenseries. Some plants pay a certain price the first half of the month and different prices the last half. In such cases the prices for the two periods are averaged. If prices for the current month are not available the price for the preceding month is given.

City	Price to producers per 100 lbs.	Test of basis of payment %	Price paid for 3.5% milk
Berlin	$1.75	4.0	$1.53
Bloomer	1.80	4.0	1.57½
Brooklyn	2.00	3.5	2.00
Burlington	1.80	4.0	1.60
Chilton	1.80	4.0	1.57½
Clinton	2.00	3.5	2.00

*denotes prices paid for September.

†Price for Hartford last month should have been $1.60 instead of $1.50 as given.

September Powdered Milk

(Report by U. S. Dept. of Agriculture)

Producers supplying powdered milk plants during September received from $1.58 to $2.45 a hundred for 3.5% milk. These plants pay from 10c to 30c a hundred for skimmilk and from 9c to 18c a hundred for buttermilk.

During September powdered whole milk sold for 56c to 60c per pound as case goods and for 22c to 28c per pound in barrels. Powdered skimmilk sold for 40c to 44c per pound as case goods and for 4½c to 11c a pound in barrels. Dried buttermilk sold for 3½c to 12c a pound in barrels.

San Lac Seals

The "Ideal" Pull Cap That Pulls Business

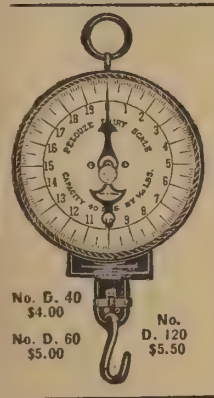
You Who Produce and Distribute Your Own Milk

If you want to hold your present customers in spite of competition—use San Lac Seals. If you want to secure new customers without extending your present route—use San Lac Seals.

The convenience and sanitary features of the San Lac Seal appeal to housewives. They prefer the San Lac Seal. They tell their neighbors about them.

San Lac Seals will hold your present customers and secure new ones. Send for samples and show them to your best feminine adviser. She can tell you what advantage it would be to use them.

Every milkman can afford to use San Lac Seals. 10,000 seals will cost you only $15 F. O. B. factory, including cost of design. This investment is not large and will show you how much they are worth as customer getters and holders.



Cross-section view of bottle top with SAN LAC SEAL in place. Note the straight cap which covers the pouring lip of the bottle.

The use of San Lac Seals in your town is inevitable. Introduce them and gain the benefits.

Write for Sample Cap and Price.

October Condensed Milk

(U. S. Department of Agriculture)

Information regarding prices paid producers for 3.5% milk delivered at factories during October is based on reports made by 119 condensed and evaporated milk firms:

Geographic sections	No. of factories	Price per cwt. Range	Ave.
New England	1	$2.17	$2.17
Middle Atlantic*	19	1.58—2.62	1.84
South Atlantic	1	2.32	2.32
E. No. Central	73	1.47—2.40	1.64
W. No. Central	4	1.57—1.65	1.60
North Western	12	1.57—1.72	1.63
South Western	10	1.60—1.79	1.65
United States	119	1.47—2.62	1.70

*Fifty-eight additional factories reported prices to be based in part on the current month's wholesale butter quotations. Twenty-three factories reported prices not determined, and nine reported plants closed.

The eight factories in the Middle Atlantic Section not included in the previous report averaged $1.86 per cwt. for 3.5% milk in the 201—250-mile freight zone from New York City.

Manufacturers' wholesale selling prices for sweetened condensed and unsweetened evaporated milk were as follows for September:

	Range	Ave.
Condensed, per case	$5.20— 6.35	$5.75
Condensed, per cwt.	6.90—11.00	9.51
Evaporated, per case	3.24— 4.50	3.87
Evaporated, per cwt.	7.23—12.50	9.14
Condensed skim, per cwt.	4.00— 7.50	5.95
Evaporated skim, per cwt.	2.00— 7.60	3.96

FOND DU LAC, Wis., Oct. 31—Average cheese prices (majority of sales), f. o. b. shipping point: Twins, 18c; single Daisies, 18½c; Longhorns, 18½c; square prints, 20c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange, Nov. 1: Single Daisies, 17¾c. On Farmers' Call Board, Oct. 31: Single Daisies, 17¼c; Longhorns, 17¾c; square prints, 19⅝c.

MILWAUKEE, Nov. 3—Creamery, extra, tubs, 38c; standards, 37c; extra firsts, 35@36c; firsts, 31@32c; seconds, 30@32c.

Eggs—Fresh gathered firsts (new cases), including cases candled, 47@47½c; ordinary first standard cases), 45@46c; miscellaneous lots, shippers' cases returned, candled, 42@44c; seconds, dirties, 29@30c; checks, 20@28c.

Cheese—American full cream, Twins, 18@18½c; Young Americas, 18½@19c; Longhorns, 19@19½c; Daisies, single, 19@19½c; squares, 19½@20c; American, 32c; Pimento, 34c; Swiss, 42c; Bricks, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss loaf, 42@47c.

CHICAGO, Nov. 3—The butter market today ruled steady with trading quiet. Buyers showed little interest in spite of the liberal offerings on the part of sellers. Eighty-six and 87-score butter was showing some accumulation as these scores were moving slowly. The centralized car market was steady, with practically no buying interest noted. Some 90-score storage centralized reported sold at 35@35¼c. Fresh butter: 92-score, 38½c; 91-score, 37c; 90-score, 36c; 89-score, 34c; 88-score, 32c; 87-score, 30½c; 86-score, 29½c. Centralized car lots—90-score, 37c; 89-score, 34½c; 88-score, 31½c.

NEW YORK, Nov. 3—Butter—Firm; receipts, 5,392 tubs; creamery, higher than extras, 41@42½c; creamery extras (92-score), 40½c; creamery firsts (88- to 91-score), 34@39½c; packing stock, current make No. 2, 26c.

In doing or saying, think not of the apparent effect, but the actual justice.—ALFRED PALMER.

Dec. 9—Holsteins. Dispersal of J. M. Kelley herd at Baraboo, Wis. Frances Darcey, Sales Manager.

FORWARD WISCONSIN
FARM FACTORY COMMERCE

What Do You Believe?

ARE our factories and the men who try to carry them on, good or bad for our state?

That is a question all citizens of Wisconsin must think about. They should get the facts and answers for themselves. They should not let the hearsay of vote-chasers decide it for them.

Look Around. See for yourself what factories have done for your town or other towns you know about, and what they have meant for the building up of farms and communities.

Shall we let unfair laws hold back Wisconsin industry? Any unsound laws such as:

1. Making it a crime for anyone (except the farmer) to work more than eight hours a day.
2. Wage insurance for idle men.
3. Higher taxes than are paid in other states.

Some of our large industries have already turned their Wisconsin plants into branch factories. When big industries turn their plants into branch factories four things happen that affect every citizen:

1. Wisconsin loses the right to collect income taxes on business not done in the state. On the average ninety per cent of their products are sold in other states.
2. We lose the right to assess taxes on officers and stockholders who go to live in other states.
3. We lose the right to collect inheritance taxes from the estates of those who have moved away.
4. Most of all, we lose the advantage of the presence of men of ability and capital who can help to build our communities and our state.

Farm and Factory Must Prosper Together

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Danny Goes to Club Meeting

Foreword: Another chapter in the "Adventures of Daniel Dare". Although not perfect by any means, the secretary's report may give you some ideas about writing such a report. The facts which Danny gathers at this meeting with regard to the history of club work should interest you. Perhaps you will find some program and business meeting helps here, too. Read on.

"THE meeting will please come to order." President Jimmie Watkins gave three sharp raps with his gavel upon the table top. The buzzing stopped. Twelve pairs of eyes turned toward the president.

"The secretary will please read the minutes of the last meeting." David Baker arose, picked up the book and began.

"The last meeting of the K. K. K. was called to order by the president at 3 o'clock Saturday afternoon, October 18. It was held at the home of Conrad Simms. The secretary's report was read and approved. Roll call was then taken and each member answered by giving a report upon his project. Several reported that they had already selected seed corn and picked out the piece of ground they were going to use the following spring for their project. It was voted that Daniel Dare gave the best project report. As there was no further business to be conducted at this meeting, it was adjourned at three thirty and followed by the program prepared by the committee of which Harold Hopkins and Bill Burns were the two members. There were some very good numbers on the program including readings, songs, and a talk by our club leader, Mr. Matthews. The program committee is to be congratulated upon the fine entertainment they provided for us. The club was then happily surprised by Mrs. Simms who served delicious refreshments consisting of home-made ice cream and cake. A vote of thanks was given to Mrs. Simms for the very splendid hospitality which she extended the club on that day. We then went outside and had a very fine ball game. This ended the day's activities and we left for home about five o'clock."

"If there are no corrections to be made, the minutes will stand approved as read," President Watkins announced. "We will now have roll call. Please answer by reporting on your project."

The secretary then called the roll and each club member stood up and gave a report. Occasionally the leader interrupted with a question or two. When the boy questioned could not answer, the question was given to the whole club.

"Is there any further business to be brought up at this time?"

And so the meeting proceeded until at last—"If there is no further business, the motion is in order for adjournment, following which we will have our regular program."

"I move we adjourn!"

"Second the motion."

"All those in favor of adjournment, please signify by saying 'Aye'."

A unanimous chorus resulted.

No, this is not Teddy Roosevelt, but "Daddy" (R. A.) Moore, head of the Agronomy Department at the Wisconsin College of Agriculture. Professor Moore, among other achievements, is connected with the early history of club work.

"Fellow club members, we have the unusual privilege today of having with us our Assistant State Club Leader, Mr. McCarthy. He has come quite a ways to be with us. I am now going to call upon him to give a short talk. I think he is going to say something on the subject 'The Story of Club Work'."

Mr. McCarthy arose and—"Mr. Chairman, I have been very much impressed with your very fine business meeting. I think it is splendid that you boys and girls have the opportunity of getting together in this family-sort-of-a-way and talking things over, but at the same time injecting business methods into your meeting. I am glad to be with you today and I will try to say something which may be new to you.

"Club work is hardly twenty-five years old. About the first that was done along this line was some time around 1900 when O. A. Benson, a rural school teacher in Iowa, organized a club of rural boys and girls for out-door nature study.

"I think you will be much interested to know that one of the first boys' clubs was a corn club. Perhaps we really couldn't call it a club, as we know it today, but at any rate the principles were just the same then as they are now.

"Soon after Mr. Benson formed his out-door nature study club, Professor R. A. Moore of the Wisconsin College of Agriculture, who had been developing some new strains of corn and wanted them to get out among the farmers of the state, thought the best way he could do it would be through the boys and girls. So he distributed quite a large amount of good seed corn. He then arranged a contest in Richland County. More than $300 were offered in prizes. The boys and girls were furnished with pure-bred seed. The first year about four hundred boys and girls took part. Within five years, fifty-one counties held similar contests. It is estimated that in 1912 approximately 20,000 boys and girls competed in Wisconsin alone.

"About the time 'Daddy' Moore started his corn club work in the North, Dr. Seaman A. Knapp, of the Bureau of Plant Industry in the U. S. Department of Agriculture, started a similar line of work among the boys and girls in the South. In 1905 there was a failure of the cotton crop because of the boll weevil. Dr. Knapp, after an investigation, told them that a variety in rotation of crops was necessary. Dr. Knapp had heard of the work going on up North, so he decided to make the boys in his country demonstrators in the art of corn growing. In this way, the corn clubs in the South were organized. Thousands of boys and girls enrolled.

"As a result of this work, great quantities of corn were thrown onto the southern market and the next problem was that of marketing. The hog seemed to be a profitable means for marketing corn and the pig club idea got started.

"Girls began to show more and more interest in club work and in a short time garden and canning clubs came into existence. By 1912 club work throughout the cotton belt was firmly established.

"In 1914 the government saw fit to nationalize the club movement. The Smith—Lever act was passed in 1914 and gave club work a sound, financial backing. A half million boys and girls are enrolled in club work throughout the United States at the present time. Nearly every state in the Union has boys and girls enrolled.

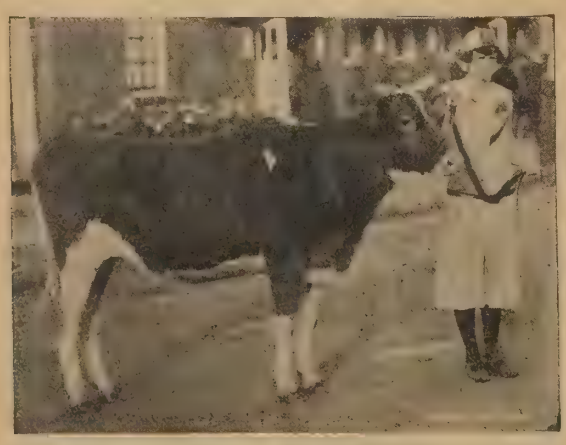
"Now the fundamentals laid down in this early work by Dr. Knapp and Professor Moore have remained unchanged throughout all these years of 4-H Club development. These fundamentals are: (1) that the boy or girl should own a project; (2) should conduct the project according to directions; (3) should keep records on the project; and (4) should make an exhibit.

"I have here a little button in the lapel of my coat and I see that all you boys are wearing the same button. What is it you see on this button? A four-leaf clover, that's right, and what do the four H's stand for? Head, hands, heart, and health. What does the four-leaf clover stand for? Ah, you say good luck. No, and yes. I think the four-leaf clover stands for pluck, but do you know, if you work, work, work, you can work that letter 'p' right off, and what you have left will be 'luck'.

"Now I want to congratulate you boys and girls on your splendid meeting. I want to urge you to keep right on with club work. Your president here, Jimmy Watkins, has made a fine record, and one which the rest of you boys will have hard work to beat, but remember, it can be done.

"I think a good way to close the afternoon session would be first to repeat the 4-H club creed and then sing some good old club songs. All together now on the creed.

"I pledge my head to reason, my heart to loyalty, my hands to service and my health to efficiency for the good of my country, my community, and my home.

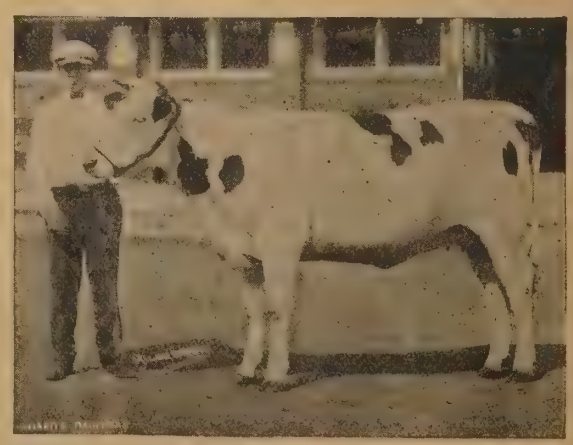


"Now what will we sing? What will it be? Hurry up."

And so the meeting was turned over into a song fest. They sang many club favorites, including "Hail, Hail, the Club's All Here", "I'm Forever Boosting Club Work", and others.

Then came the refreshments and after that a ball game outside, but before the club had dispersed, a big vote of thanks was given to Mr. McCarthy for the message he had brought, and to Mrs. Watkins for her splendid hospitality and most excellent refreshments.

What a jolly time they had at their club meetings! The club met once a month at the home of some member. The first Saturday afternoon in each month was set aside as the regular meeting date.



Daniel Dare went home with a new vision of what club work meant and with a new determination to win out in spite of whatever obstacles he might come up against. The spirit of club work had entered Daniel's soul and made his body fairly tingle with ambition.

MARGARET RUSSELL, A HOARD'S DAIRYMAN JUNIOR, SHOWED AUGUST GUSSE'S YEARLING GUERNSEY IN THE CLUB CLASS AT THE NATIONAL DAIRY SHOW AND WON A BLUE RIBBON

MEET ADOLPH MISTELE AND HIS BLUE RIBBON JERSEY YEARLING HEIFER, NOBLE GYPSY LADY. HANDSOME PAIR, DON'T YOU THINK? THEIR HOME IS IN WISCONSIN

EARL CROWELL, LIKEWISE A HOARD'S DAIRYMAN JUNIOR, WON FIRST AT THE NATIONAL ON HIS YEARLING HOLSTEIN HEIFER SHOWN HERE

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

In the October 31 issue the following articles are discussed: "Gasoline Engine Troubles and Remedies", "Nutrition Dairy Barn Completed", "A High Point at the National Dairy Exposition", "What Cow Testing Will Do for the Dairy Farmer", "Building Success on Quality", and "Keeping up Fertility on Dairy Farms".

How can you tell whether or not the carburetor on your engine is getting gas? By opening the drain cock under the carburetor. If fuel flows out freely it is in good shape. It is a good idea to drain the carburetor occasionally to get rid of water and any foreign matter that may collect.

What is the purpose of the new dairy barn at Beltsville, Maryland? The new $20,000 dairy barn on the Experimental Farm of the Dairy Bureau is two stories in height, 36x118 feet in dimensions and is built of concrete and tile with a gable roof. It will serve the two-fold purpose of containing an experimental laboratory and housing dairy cows for the purpose of studying animal nutrition.

Why was the grade cow exhibit at the National so important? It showed the high value of good purebred bulls. No cow was allowed in the grade cow exhibit with an average of under 350 lbs. of butterfat in one year. Cows under four years of age had to produce 250 lbs. of butterfat.

What will the cow testing association do for the dairy farmer? It will help him to discover the unprofitable cows; help him increase production and profits; teach him the best crops to grow; help him buy feed co-operatively; and develop community spirit.

Give Mr. Ramsay's rule for success. Believe in yourself and your work. Set a fair price and hold to it. Put your hand to the plow and work like blazes with your eye on the goal.

How can soil fertility be kept up on the dairy farm? By liberal application of manure, by proper growing of legumes, by the addition of lime, phosphates, and potash when needed.

Junior Letters

Keep on Trying

Hoard's Dairyman Juniors:—I joined the calf club a year ago last May. The first meeting we had we elected officers for the calf club, then elected a local leader, president, and vice-president and secretary-treasurer. I was elected secretary and treasurer and my work is to keep minutes, call meetings, and keep the treasurer's report. In July we began to go judging and the middle of September we had county fair when our calves were judged. My calf took second place. The county agent picked out the team to go to the state college. We took fifth place, but we weren't disappointed. We are going to keep trying till we make a success of taking first place.

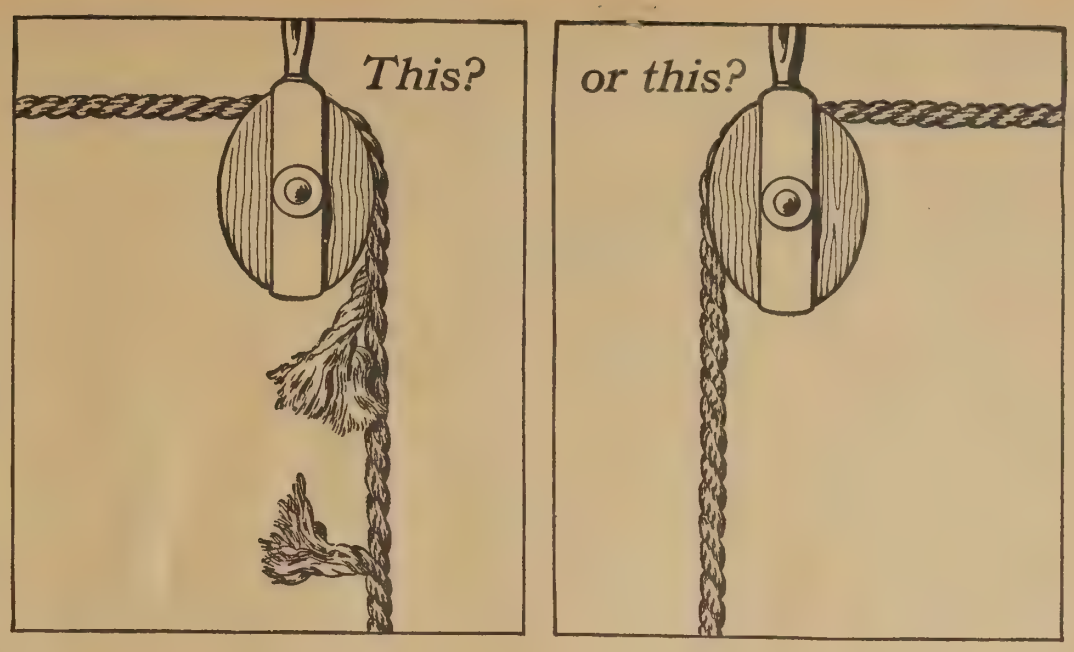
New Mexico. Robert Jones.

Best Jersey Club Members

Hoard's Dairyman Juniors:—We are two girls from Louisiana; both of us belong to the Boys' and Girls' Agricultural Club. One of us belongs to the poultry club and the other to the Jersey Calf Club. Our county agents' names are Miss E. Deshatels and Mr. I. J. Heath. I, Gertrude Sharp, am a member of the best organized club in the state, Seventh Ward. Dorothy's brother, Staples, and I won the first prize for being the best boy and girl Jersey calf club members in the state. The prizes were Panama hats.

I, Dorothy McClendon, am a poultry club member of the ninth ward club. I take great interest in raising Rhode Island Reds. Last spring I had an incubator hatching; it was very interesting to watch them come out of the shell. I won prizes at both the Baton Rouge Poultry Show and at the Boys' and Girls' Short Course last summer (1923).

We would appreciate and answer all letters received. Our addresses are Dorothy McClendon, Harelson, La., and Gertrude Sharp, Baton Rouge, La., R. F. D. No. 2, Box 85.



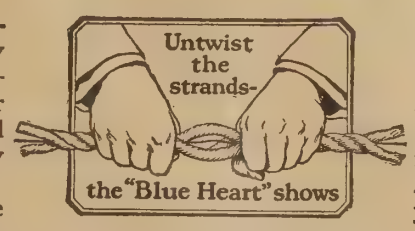
Dorothy McClendon and Gertrude Sharp.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.



You can tell *beforehand* how a rope will wear

TIME and work will eventually prove the value of *any* rope. But that's too late—*after* you've spent your money. Know beforehand and you'll save both money and disappointment.

There *is* a way to tell rope value in advance—a sure way. Not by outward appearance, for ordinary rope may look better than it is. And even in manila ropes there is wide variation. Many grades of manila fibre can be spun into "manila rope".

Untwist the strands of a rope before you buy. If you see a thin, blue thread marker—the "Blue Heart"—running in the center between the strands, then you may be sure of these facts about the rope.

What the "Blue Heart" signifies

The "Blue Heart" marker means that the rope is genuine H. & A. "Blue Heart" Manila Rope spun from high grade, pure selected manila fibre by rope makers with over half a century's accumulated experience.

It means also that in any size, on any job, the rope will wear longer and deliver without fail the strength you have a right to expect. For the selected fibres of H. & A. "Blue Heart" Manila Rope are drawn, spun, laid and properly lubricated so as to insure the smooth working of every fibre, yarn and strand.

Buy rope scientifically. Know what you are getting. Untwist the strands and look for the "Blue Heart"—our registered trade mark that assures you of dependable rope value.

GUARANTEE

H. & A. "Blue Heart" Manila Rope is guaranteed to equal in yardage and exceed in tensile strength the specifications of the U. S. Government Bureau of Standards. Any H. & A. "Blue Heart" Manila Rope found not to be as represented will be replaced.

For sisal rope

For other jobs where a high-grade sisal rope is wanted, use the best—H. & A. "Red Heart" Sisal Rope—spun from selected sisal fibre by the same skilled rope makers.

Whatever may be your use for rope you will find an H. & A. brand of cordage to meet your requirements.

Special offer

The coupon below with 25c will entitle you to our special Halter Lead made from H. & A. "Blue Heart" Manila Rope. It is ½ inch in diameter, 7 feet long, and is fitted with a snap at one end. It is offered to introduce to you the great strength and wonderful wearing qualities of H. & A. "Blue Heart" Manila Rope.

If your dealer does not carry H. & A. "Blue Heart" and cannot supply you with this special Halter Lead, fill out the coupon below and mail it to us with 25c, coin or stamps, and your dealer's name. A Halter Lead will be sent you prepaid at once.

The Hooven & Allison Company
"Spinners of fine cordage since 1869"
Xenia, Ohio

H. & A. "Star Brand" Binder Twine

evenly spun from the best fibres, is of full yardage, ample strength, and is used from coast to coast by farmers who claim it is never cut by insects

Two Good Records for Pinehurst Ayrshires

Pinehurst Farm Ayrshires are bred for production. Recently two more records above 500 lbs. fat were added to the list made by members of this herd.

Flossie's White Beauty, a five-year-old, gave 11,341 lbs. milk, 527.20 lbs. fat in 346 days for the Advanced Registry. In the Roll of Honor, 300-day production, she is credited with 10,662 lbs. milk, 491.90 lbs. fat; carrying a living calf 230 days of this period.

Hazel's White Belle, also a five-year-old, gave 14,077 lbs. milk, 577.67 lbs. fat in 347 days for the Advanced Registry. In the Roll of Honor she becomes the champion for her age with 13,265 lbs. milk, 541.69 lbs. fat; carrying a living calf 222 days of the 300-day period.

Pinehurst Farm is owned by Leonard Tufts, North Carolina.—Ayrshire Breeders' Association.

The Agricultural Experiment Station, University of Wisconsin, has just recently issued a bulletin dealing with "Contagious Abortion in Cattle", that will make a valuable addition to the dairy library especially on those farms where this disease has given trouble.

The subjects discussed are: 1, Prevalence of and losses due to cattle abortion; 2, Causes of abortion in cattle; 3, How abortion starts and spreads; 4, When and where the germs locate; 5, Results of abortion infection; 6, How to detect the disease; 7, What to do and how to do it; 8, Complications and sequels of abortion; 9, Practical suggestions for herd and stable management.

Write to Agricultural Experiment Station, Madison, Wis., for Bulletin No. 368.

Aunt Ada's Axioms: Thrift may be carried too far; it is better to put in a water system now for mother than to give her a fine tombstone a little later.

LARGE DAIRY, GENERAL PURE BRED STOCK, SPECIAL CROP FARM

One of the Best Farms in East Offered FOR SALE at Price that Insures Quick Sale.

Illness in family necessitates sacrifice 450 acres fertile crop land; verdant, well watered pastures; virgin timber; large, well kept buildings at little more than half its value. Home Farm Holstein Sale

One of the oldest and best known Holstein herds in the Middle West was broken up when the Home Farm herd owned by W. B. Barney & Sons, Iowa, was dispersed October 14. It was a herd well known for both good type and production and the sale brought buyers from Ontario, Missouri, Minnesota, Wisconsin, and Iowa.

Fifty-seven head sold for $13,810, an average just short of the $250 mark with $850 the top figure. Hollyhock Farms, Wisconsin, paid this for an 1100-lb. daughter of Sir Sadie Cornucopia.

Mack and Wood did the selling.

The following list includes those animals selling over $250 and buyers' names:

Leslie Ash, Minnesota	
Home Farm Prince Fobes	$350
Fredmar Farms, Missouri	
Sadie Whitebird of Home Farm	$435
Home Farm Sadie Vale Empress	625
Sadie Whitebird of Home Farm 3d	260
W. J. Elgie, Ontario	
Sadie Gerben of Home Farm	$550
Quoque Korndyke Sadie Vale 2d	450
Hollyhock Farms, Wisconsin	
Sadie Cornucopia Whitebird	$850
Sadie Fobes of Home Farm	500
Quoque Korndyke Sadie Vale	685
Chas. Otis, Iowa	
Home Farm Sadie Vale Lorella	$325
Sadie Whitebird of Home Farm 2d	275
State of Iowa	
Home Farm Sadie Vale Ebertje	$305
Home Farm Sadie Vale Clothilde	310
Otho Evans, Iowa	
Home Farm Ormsby Sadie Vale	$265
Peter Lund, Iowa	
Sadie Ormsby of Home Farm 2d	$295
L. W. Kennedy, Iowa	
Home Farm Ormsby	$250
Delos Matt, Iowa	
Home Farm Lorella	$260
Minnesota Holstein Co., Minnesota	
Home Farm Pietje Florence	$460
Harold Winterink, Iowa	
Sadie Cornucopia Gerben Maid	$295

Louisiana Dairymen Organize

HOARD'S DAIRYMAN:—The dairymen in the parishes of East and West Feliciana met at Lindsay, Louisiana, and organized the Feliciana Dairymen's Association.

The objects of forming an association were declared to be, first, to form the dairymen into a co-operative business organization, to facilitate the buying of feed, fertilizer, and equipment at quantity prices; and, secondly, to co-operate with other local dairymen's associations with the view of taking into consideration the predicament of the dairy farmer on account of the drought and to secure a fairer price for milk.

Few people realize that such crops as hay, oats, turnips, mangels, carrots, and clover, and all other crops which furnish winter feed for cattle, are 100 per cent failure, hence the farmer is brought face to face with the great hardship of buying all the feed necessary to produce milk until April, 1925. Such a condition is unprecedented and impossible unless the price of milk to the dairymen is improved.

MALCOLM DOUGHERTY, Sec.

Two California Holsteins Enter 1,000-lb. Class

Recent reports from the office of the Supt. of Advanced Registry of the Holstein-Friesian Association give notice of two more Holstein cows that have entered the ranks of the 1,000-lb. butterfat producers.

Helen Veeman Woodcrest, a 4-year-old bred and owned by F. M. Helm of California, produced 36,217.7 lbs. milk containing 1,003.86 lbs. fat (1,254.82 lbs. butter) in a year.

The next cow to qualify for this honor is Lady Korndyke Canary Johanna, also a 4-year-old, bred by F. S. Kenfield of Michigan, and now owned by L. B. Van Blaricom of California. She produced 27,274.6 lbs. milk containing 1,008.1 lbs. butterfat (1,260.12 lbs. butter) and is the 86th Holstein cow to produce in excess of 1,000 lbs. fat in a year.

Milk Record Sheets

For years Hoard's Dairyman has been preaching the necessity of keeping records of the production of each cow. Only by knowing how much milk each cow actually gives is the dairy farmer able to improve his herd. Our Book Department has various sizes of milk record sheets to make it easy to keep tab on your cows. Complete samples with price list will be sent for 5 cents in stamps. Address Hoard's Dairyman, Fort Atkinson, Wis.

Imported Melotte

with the *self-balancing* bowl. Positively cannot get out of balance therefore cannot vibrate. Can't remix cream with milk. Runs so easily, bowl spins *25 minutes* after you stop cranking unless you apply brake.

$7.50 After 30 Days FREE TRIAL

Catalog tells all—WRITE

Caution! U. S. Bulletin 201 shows that vibration of the bowl causes *cream waste!*

30 days' free trial — then, if satisfied, only $7.50 and a few easy payments — *and* — the wonderful Belgium Melotte Separator is yours.

Catalog FREE

Send today for free separator book containing full description. Don't buy any separator until you have found out all about the Melotte and details of our 15 year guarantee.

BULL BROS.

HOLSTEIN SALE!

Tuesday, Nov. 18

TERMS CASH

Owing to loss of barn by fire we must sell

70 Registered Females 70

Offering will include 50 heifers up to four years, all daughters of K. P. B. A. Fedora King, a proven grandson of King of the Pontiacs from Novelty Fedora Hengerveld, 1022 lbs. butter, 22,000 lbs. milk, 4 years; 800 lbs. at 2 years.

K. P. B. A. has daughters with 900 lbs. as 2-year-olds to 1100 lbs. at maturity.

These heifers have been raised on hay entirely; no ensilage has been fed on farm for past seven years, and they have passed their lives outdoors.

Herd is free from tuberculosis and is absolutely free from abortion, as the number of female offspring will prove—nearly 100 head sired by K. P. B. A. from an original herd of thirty-five head in five years.

Sale held at 10 o'clock, on farm 3 miles west on Yellowstone Trail, **ABERDEEN, S. D.**

The Old Reliable La Crosse County Guernsey Breeders' Association will sell

LUCY THOMPSON

Fur Trimmings

There are quantities of fur going to waste in people's attics just because the pieces are out of style and so badly worn in spots that they are no longer presentable. It is just such pieces as these that are turning otherwise very plain dresses into smart, up-to-the-minute styles.

I was trying on ready-made tailored dresses last week and could not help thinking of the ease with which a medium-priced garment could be made to look expensive and different just by the addition of three or four small pieces of fur.

Many of the dresses this season are severely plain as to line. Some have the round necks that we are now used to, even though they are unbecoming to the "skinnies". Others have the straight, boyish, rolling collar but all have the same straight lines that we have been having. There are just enough exceptions to this rule to make us comfortable in the belted and gathered dresses if we happen to prefer them.

One of the pretty coat dresses I saw had a narrow band of fur across the back of the collar, one at each wrist, and a small square patch of it on either side of the back for the belt to slip through. This was a very expensive garment but it was the sort that could be duplicated again and again without the fur and that could be added at home—provided you have the old piece to make it from.

A lovely harmonious outfit could easily be made by not only trimming the dress but the hat with the same fur. It is being used in all sorts and shapes of little patches and some of the most attractive of these are just small triangular or round pieces sewed to a plain hat and made into the shape of a flower or other design.

Working with fur is no easy thing, neither is it impossible if you use care and remember always to cut the skin from the under side and use a sharp knife; a safety razor blade is good for this.

I saw a pretty neck piece the other day made from a worn-out piece of mink. There was just a straight piece of the fur about twelve inches by three or four. This was lined with brown silk which in turn was covered with brown chiffon. Sewed to either end of the fur was a piece of the chiffon, accordion-plaited, and about a yard long. The lower ends were finished with a small square of the fur.

The Across-the-road Barn

"It is just inviting an accident if there are small children in the family and the farm is on a main highway," said a woman lately. She was speaking of the custom of putting a house on one side of the road and the barns directly across.

"They run on all sorts of errands, dozens of times a day, from house to farm buildings and no one can expect a child to use the caution that an older person does. Traffic in the country knows no speed limit except that of the individual machine and drivers are not on the watch as they are in cities."

This is a point worth considering if you are thinking of building. It is not the only one, though. It has always seemed too bad to me when there is all out of doors to put the barns in that they are so often put right where they have to be looked at whenever the mother has a few minutes to sit on the porch or at the front window.

It is impossible to keep the stables immaculate and such dirt as must be there is right and in its place but just the same its place should be the background and not the front of the picture.

Past Finding Out

Skirts are really shorter. It makes me want to shout for there was no enjoyment in trying to walk in the long ones we have lately had and besides they were ugly on most of us.

There are always those who will say that if short skirts are good, knee length is better. That is the sort that always goes to the ugly extreme on everything and I shudder to think that we may soon be looking at the same bobbed skirts that we had a few years ago. That was war time and they said it was a saving in cloth. I wonder what the reason will be this time.

The whims of our sex with regard to clothing have always been a source of amusement to the men, but James J. Montague mixes his with resignation in this poem:

"I do not know why women choose
To hobble 'round in high-heeled shoes.
And it is none of my affair
If they unbob or bob their hair.
I only know that they will do
What menfolks don't expect 'em to.

I do not know why women change
Their clothes to fashions new and strange,
With curious backs and funny fronts,
And always change them all at once.
I only know a woman can,
Whene'er she likes, outguess a man.

I do not know why turtles sleep
Upon the surface of the deep,
The casual looker-on would think
That heavy brutes like that would sink.
But turtles lead their own sweet lives
And so do widows, maids, and wives.

Cheering Up the Winter Days

In the one-room school I used to attend we debated every so often about whether more enjoyment was derived from looking forward to possessing a thing than from actually possessing it; in other words, "Resolved that the pleasures of anticipation are greater than those of realization."

In the matter of bulbs I think that there is as much to say on one side as on the other, for I have always enjoyed tremendously watching them come on. About the first of November I usually start my old reliables, the paper white narcissus, for Christmas blooming and while this cannot be calculated exactly you can be reasonably certain that seven or eight weeks is long enough to allow.

I once saw some bulbs sending out perfectly glorious blossoms from the cut-out top of an old teakettle which was so ugly that it almost seemed to belittle the flowers though it was better to have them there than not to have them at all. For ten cents you can get glass or pottery bowls or the old fashioned little crocks which, in a plain putty color, are quite artistic.

Fill these three-fourths full of shells or pretty stones, put in enough stones to cover the bulbs loosely and fill the jar with water, being sure not to let it come over the stem end of the bulbs.

Set in a cool, dark place for a couple of weeks, then bring to the light for about two days, and then set in the sun, being sure always to have enough water on them.

Bulbs potted in earth take more time in the blooming but the procedure is about the same as when water is used. They should be left in the dark for from four to eight weeks. After bringing them out the time required for blooming is three to six weeks. This applies to the tulips, jonquils, narcissus, hyacinths, and all similar bulbs.

In Starting the Meeting

Many of our club meetings are a little stiff at the first calling to order. We would like to have them pleasant and sociable yet it is desirable to have enough seriousness to make them dignified and when we get serious we are apt to be formal and not at ease with our fellow members.

It might not fit your particular club at all but there are many meetings that are most suitably called to order with a little prayer. I don't know how you feel about it but I think that the average woman is pretty hard put to it if she has to make a public prayer of even two sentences. That is no reflection on her religion, either, but she is used to saying her prayers privately and her public appearance frightens her.

There is a Miss Mary Stewart of Washington, D. C., who has written a prayer which has been used widely by club women. It has nothing in it to offend the religion of anyone and it breathes a true sincerity of desire that is inspiring on days when, in spite of ourselves, we find we are centering our attention on the mean, small things instead of on the good. It is easy to learn and could be repeated in unison.

"Keep us, oh, God, from pettiness; let us be large in thought, in word, in deed.

"Let us be done with fault-finding and leave off self-seeking.

"May we put off pretense and meet each other face to face—without self-pity and without prejudice.

"May we be never hasty in judgment and always generous.

"Let us take time for all things; make us grow calm, serene, and gentle.

"Teach us to put into action our better impulses, straightforward and unafraid.

"God grant that we may realize that it is the little things that create differences, that in the big things of life we are as one.

"And may we strive to know and touch the great, common woman's heart of us all and oh, Lord God, let us not forget to be kind."

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Mrs. Jones: My husband ran a tank during the war and now he can't even run a vacuum cleaner for me.—Good Hardware.

"Tom, here's a real light—

—you ought to get one. It's the COLEMAN QUICK-LITE. The handiest, best all-round lantern I ever saw or used. Look at the light it gives—300 candle-power strong! That's more light than you get from 20 old-style oil lanterns. Does n't cost much to use, either. And it's right on the job *all* the time."

Use It Everywhere!

Just the light for night chores around the barn, feed lot, dairy and orchard; for night hauling, harvesting, ditching, road grading — any place, any time.

Here's Why You'll Like It!

The QUICK-LITE is safe—can't spill fuel even if tipped over. Can't blow out. Has wind-proof and rain-proof mica globe. Lights with matches! Built of durable brass and steel, heavily nickeled. Inspected, tested and guaranteed. Will last a lifetime.

Price $7.50 (W. of Rockies $8.00). If your dealer can't supply you, write us. Address Dept. H. D. 42.

Friendly Talks for Farm Folks

Yo ho! a bottle of milk and a cheese sandwich! What more can any man, dairyman, or banker desire for Sunday night supper than these?

⚜

Speaking of celebrities and their titles, how many pure-bred calves born this year have been christened the Prince of Wales?

⚜

Aunt Jane Ferkin states that if more young mothers of this generation would use a club on their offspring instead of joining one, the coming generation might not take it into its head to murder and steal and act so utterly outlandish as the papers say they do.

⚜

Walt Whitcomb says that he would be almost willing to make a will and then die if he could be certain that by so doing his relict would find one lawyer in this much-lawed world who would settle up his estate in six months instead of the customary six or sixteen years.

⚜

Farmers are certainly having a lot done for them of recent years and it is to be hoped that they appreciate it. The farm bureau tells them how to farm scientifically; the weather bureau goes out of its way to give them daily forecasts which five times out of ten are nearly accurate; the experiment stations send them lengthy bulletins which are supposed to be read with profit during the long evening hours; the radio carries the advice and assurance of political and otherwise friends who always have a vast concern in the doings of the farmer; the merchants and chambers of commerce have regular dollar days wherein the farmer is permitted to move slow goods at regular prices; and in many other ways too numerous to mention, the kind old world keeps everlastingly seeing to it that the old farmer is not frogotten or left forlorn at its hands. To make a long story short, the world will do everything for the farmer except help him with his dirt farming and agree with him that a dollar honestly earned should be paid him for his produce. Isn't it the truth?

⚜

We have often wished that it would be practicable for provision stores or dairy shops to keep glass churns in their windows for the making of butter before the eyes of city butter-consumers. Perhaps this is already done in the large centers—it would surely be an interesting process to watch for the average person. The coming of butter to us has always seemed one of those strange and wonderful things which weekly repetition never stales.

⚜

Some folks love apples best just as they come juicy and red from the tree; others think that apple cider is about the best natural brew on earth; some, on the other hand, can't see an apple except under the warm cover of a fragrant, spicy pie; while there are those who couldn't sit down to the table in winter without bread spread thick with flavorsome butter boiled down sweet from tree-fruit. But any old way—if the Literary Digest or Hoard's Dairyman or the Ladies' Home Journal, et al should take a straw vote of this country's favorite fruit, the returns would be pretty sure to be overwhelmingly decisive in favor of Friend Apple. As Lincoln once said about the common people, to paraphrase a bit—"The Lord must have known how well His folks were going to love apples, as He made them to grow in every ordinary orchard from Portland to Portland."

New York. HELEN S. K. WILLCOX.

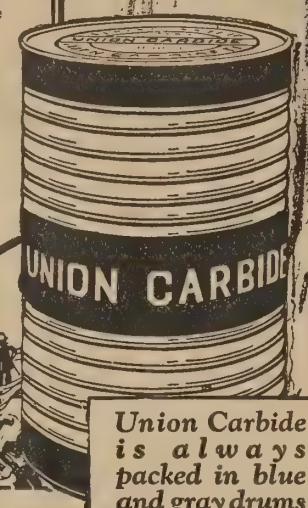
UNION CARBIDE

Niagara lights the farm



AT NIAGARA FALLS, New York, is located one of the immense works in which Union Carbide is made.

From these works Union Carbide is shipped to 175 direct factory warehouses and from them direct to thousands of farms lighted by Union Carbide.

The power of Niagara is used in producing this granite-like material, and the almost unbelievable temperature of 6026° F is required in the furnaces! (Water boils at 212° F, steel melts at about 2500° F.)

Hundreds of thousands of farm homes depend on the continued operation of this and other great Union Carbide works for their "artificial sunlight." And thirty years of service have proved that the Union Carbide supply is as dependable as Niagara herself.

But these thirty years have proved more than Union Carbide's dependability. They have demonstrated that it yields the largest amount of pure, clean gas, with highest illuminating power. They have seen the growth of Carbide-gas lighting and cooking, from its discovery to a place in 409,000 farm homes!

Union Carbide is always packed in blue and gray drums

MILCH COWS IN 1860

L. L. SCRANTON, ILLINOIS

"THE opinions of practical men differ widely as to the comparative merits of this (Jersey) race and its adaptation to our climate and the wants of the farmers. The most common decision prevailing among many even of the best judges of stock appears to be that, however desirable the Jersey cows may be on the lawn or in a gentleman's park, they are wholly unsuited to the general wants of the practical farmer".

In self-defense, I hasten to add that these are not my sentiments, but a paragraph copied from an old book copyrighted in 1860 which, according to the title page, treats of: "Milch Cows and Dairy Farming, comprising the breeds, breeding, and management in health and disease, of dairy and other stock; the selection of milch cows with a full explanation of Guenon's method; the culture of forage plants, and the production of milk, butter, and cheese; embodying the most recent improvements and adapted to farming in the United States and British Provinces, with a treatise upon the Dairy Husbandry of Holland; to which is added Horsfall's System of Dairy Management, with a full statement of the symptoms and prevention of pleura-pneumonia." Quite a comprehensive and inclusive title, it seems, covering the entire field.

What an era of progress and advancement in the dairy industry has passed since the publication of this old book. The breeding of dairy cattle in this country was still mostly in the experimental or "accidental" stage. The breeders were just beginning to distinguish the abilities of the different breeds, which led to the development of the dairy and beef types that are so widely different in anatomy and function today. The Guernsey breed as we know it is not referred to in the book. The Holsteins are referred to briefly as a conglomerate race of Dutch cattle of various colors, while the Jerseys had not yet established themselves as a dairy breed of any practical importance, so the author states.

The only dairy breed that the author considered of sufficient importance to give its merits much space for discussion was the Ayrshires. As early as 1815, he writes, the Ayrshires had been completely changed from what they were in 1770, from a breed of "diminutive size, ill fed, ill shaped, —mostly black in color, with large stripes along the chine and ridge of their backs about the flanks and on their faces—high, crooked horns—and yielding a scanty flow of milk" to a breed "with fixed characteristics, distinguished especially for an abundant flow and a rich quality of milk".

So enthusiastic is the author over the Ayrshires that he unhesitatingly puts them at the head of the class "for the reason that it is preeminently a dairy breed, surpassing all other pure breeds in the production of rich milk and butter on soils of medium fertility, and admirably adapted, in my opinion, to raise the character of our stock to a higher standard of excellence. The best milkers I have ever known in the course of my own observations, were grade Ayrshires, larger in size than the pure bloods, but still sufficiently high grades to give certain signs of their origin." The author quotes another writer to substantiate his remarks, who says that "for purely dairy purposes, the Ayrshire cow deserves first place—all dairy farmers who have any experience on the point agree in stating that an Ayrshire cow gives generally a larger return of milk for the food consumed than a cow of any other breed."

The records of some of the best Ayrshire cows of that time are interesting when compared with Garclaugh May Mischief's record of 25,329 pounds of milk in a year or with Lily of Willowmoor's five-year record of 84,991 pounds, or many of the other high producers of the present day. "One of the four cows originally imported into this country by John P. Cushing Esq. of Massachusetts, gave in one year 3,864 quarts, beer measure, or about 966 gallons at 10 pounds to the gallon. Youatt estimates the average Ayrshire at 600 gallons per cow per ear. Aiton sets the average of the best cows at 1,000 gallons. Mr. Rankin puts it lower, at about 650—700 gallons per cow—and on his own farm of inferior soil his dairy produced an average of 550 gallons only."

The author of the book, however, recognizes the ability of the Jersey cow to produce butterfat by advising, with a great deal of caution, that a few Jerseys be added to the herd if the making of butter is the object of the dairyman. "The place of the Jersey cow is rather in private establishments, where the supply of cream and butter is a sufficient object, or in limited numbers to add richness to the milk of large butter dairies. Even one or two good Jersey cows with a herd of 15 or 20 will make a great difference in the quality of the milk and butter of the whole establishment; and they would probably be profitable for this, if for no other reason."

That the Devons have never been noted as a dairy breed, the author blames upon the breeders themselves in selecting for beauty and symmetry of form instead of emphasizing the mammary development. He answers any claim the Devon breeders may make in this manner: "The fairest test of its fitness for the dairy is to be found in the estimation in which distinguished Devon breeders themselves have held in this respect. A scale of points of excellence in this breed was established, some time ago, by the best judges in England; and it has since been adopted with but slight changes in this country. These judges, naturally prejudiced in favor of the breed, if prejudiced at all, made this scale to embrace one hundred points, no animal to be regarded as perfect unless it excelled in all of them. Each part of the body was assigned its real value to the scale. If the animal was defective in any part, the number of points which represented the value of that part in the scale was to be deducted pro rata from the hundred in determining its merits. But in this scale the cow is so lightly esteemed for the dairy, that the udder, the size and shape of which is of the utmost consequence in determining the capacity of the milch cow, is set down as worth only one point; while, in the same scale, the horns and ears are valued at two points each, and the color of the nose and the expression of the eye are valued at four points each. Supposing, therefore, that each of these points were valued at one dollar each, and a perfect Devon cow was valued at one hundred dollars; then another cow of the same blood, and equal to the other in every respect except in her udder, which is such as to make it certain that she can never be capable of giving milk enough to nourish her calf, must be worth according to the estimates of the best

Devon breeders, ninety-nine dollars!!! It is safe, therefore, to say that an animal whose udder and lacteal glands are regarded, by those who best know her capacities and her merits, as of only one quarter part as much consequence as the color of her nose or half as much as the shape and size of her horns, cannot be recommended for the dairy. The improved North Devon cow may be classed, in this respect, with the Hereford, neither of which has well developed milk vessels —a point of the utmost consequence to the practical dairyman."

Indiana Jersey Sire Proves His Worth

His Daughters Won Three Silver Medals and Two Gold Ones

The daughters of Sophie's Torono are gradually proving their metal through the agency of the official test, and we are now able to report that sixteen of his daughters appear in the Register of Merit, and of this number three have won silver medals and two have won gold medals. Sophie's Torono is therefore a silver medal sire and the first Indiana Jersey bull to qualify for this honor. In addition to this, four of his sons have also proved their ability and are in the Register of Merit together with the large number of their tested daughters.

The three daughters of Sophie's Torono that have met the silver medal requirements, and made him a silver medal sire, acquitted themselves as follows:

Sophie's Torono's Daisy won a silver medal on her second test by producing, with calf, 688.97 pounds fat and 12,413 pounds milk in 365 days as a senior three-year-old. She was also tested at two years, five months of age and yielded 437.55 pounds fat. At four years and eleven months she was tested for the third time and produced 641.42 pounds fat.

Sophie's Torono's Hager was the second daughter to qualify for a silver medal. She was tested at three years, one month of age and produced 679.78 pounds fat in 365 days, carrying calf for 248 days of the test.

Sophie's Torono's Hester is the third daughter that completed the requirements for a silver medal for Sophie's Torono. In her test, commenced at four years, eleven months, she produced 796.20 pounds fat and 14,055 pounds milk in 365 days. On this splendid record she won both a gold and a silver medal which have been awarded by the American Jersey Cattle Club.

All of these young and promising producers are now owned by Randleigh Farm of New York.

Sophie's Torono is over twelve years of age, and is still strong and vigorous and giving good service. He is now owned by Mr. L. McNutt of Idylwilde Stock Farm, Indiana.—American Jersey Cattle Club.

Remedy for Sucking Yearlings

HOARD'S DAIRYMAN:—Page 49 in your issue of July 25 contains a question about sucking yearlings. I have had a lot of trouble of that kind and have been driven to using a halter with a sheet iron roofing about 8"x13" fastened to the strap across the face by means of three loops of soft galvanized wire. After G. T. T. has seen one worn for a week he will know better what size and trim will serve his case best.

Almonte, Ont. A. D.

A Correction

HOARD'S DAIRYMAN:—In your October 17th issue you report that milk price being paid by condenseries at Hartford, Wis., for the month of September was $1.50 for 3.5% test. This is incorrect, as during September we paid $1.60. WESTPHAL & SONS MILK PRODUCTS CO.

Aunt Ada's axioms: The easiest way to learn the rules of the game of life is to obey the rules of play; even a croquet set helps.

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

A cow stanchion made the Kalamazoo way—strong, practical, durable, economical, yet priced remarkably low.

Kalamazoo Cow Stanchions

Strongly built of clear hardwood; well bolted; swings when cow is in stanchion; locked open when cow is entering. **$2.50 each. Send $1** and we will ship as many as wanted. Pay balance after examination. Order today or write for literature.
Kalamazoo Tank & Silo Co., Dept. 633 Kalamazoo, Mich.

4 FORD questions *asked every day*

HERE ARE THE ANSWERS

QUES. How can I minimize carbon deposit in my Ford engine?

ANS. Ford owners who use Gargoyle Mobiloil "E" frequently report running 10,000 and even 20,000 miles without taking off the head. The reason for this is that when Mobiloil "E" reaches the combustion chamber and burns, it leaves only a very light, fluffy soot, most of which is blown out through the exhaust.

QUES. How can I overcome "chattering"?

ANS. Gargoyle Mobiloil "E" gives all the freedom from "chattering" that can be secured from a *high-grade, pure petroleum* lubricating oil. "Chattering" is usually due to incorrectly adjusted bands or worn out linings, and is aggravated by the mixture of unburned fuel with the lubricating oil. When Mobiloil "E" is used from the beginning (when the band linings are new) little trouble from "chattering" will be experienced.

QUES. How can I avoid overheating—particularly when it is necessary to use low speed continuously?

ANS. One most common comment of Ford owners who use Mobiloil "E" is that they enjoy marked freedom from overheating. This is because the scientifically correct body and character of the oil enable it to resist to an unusual degree the heat developed under any condition of operation.

QUES. Isn't it true that I may get better results by using a heavier-bodied oil?

ANS. Serious damage may accompany the use of oil heavier than Mobiloil "E". Your primary need is to adequately protect every moving part. Mobiloil "E" reaches every friction surface and protects your Ford regardless of its age or the mileage which it has covered.

For the differential of your Ford car use Gargoyle Mobiloil "CC" or Mobilubricant as specified by the Chart of Recommendations.

How Good Railway Service is Benefiting the Farmers

STRIKING proof of the great value of **good and adequate** railway service is given by the way this year's grain movement has been handled. The prices of grain began in June to advance rapidly. Between June 2 and October 7 the cash price of wheat in the Chicago market advanced from $1.10 to $1.50 a bushel; corn from 77½ cents to $1.12½; oats from 47½ to 56½ cents; rye from 67½ cents to $1.31½.

The farmers desired to ship their grain rapidly to take advantage of these rising prices. **The railways were all ready to handle the business. They had moved more freight cars to the west last spring for grain handling than ever before.** They have kept on moving cars west as fast as they have been needed. They have given the farmers the best service in handling grain that was ever known.

Record-Breaking Movement of Grain

In the seven weeks ended September 27 the railroads loaded 460,000 cars with grain and grain products. This is 121,500 more than in the corresponding weeks of 1919; 157,000 more than in 1920; 61,000 more than in 1921; 84,000 more than in 1922, and 87,000 more than in 1923.

The United States Department of Agriculture said in a recent bulletin: "Movement of wheat has been heavy and accomplished with no little credit to the railroads." Eugene Meyer, Jr., Managing Director of the War Finance Corporation, said: **"Railroad efficiency in moving the crop has been without precedent."**

Good Service Depends on Fair Rates

When people are disposed to criticise freight rates, should they not stop and think that the kind of service the railways can give depends on the rates they are allowed to charge and the earnings they make?

Freight rates were reduced in 1922. There has been a strong demand since then for additional reductions in the rates on farm products. If these reductions had been made, the railways would have been crippled financially. They would not have been able to raise capital with which to buy many new locomotives and cars. They would not have been able to put and keep the locomotives and cars they already had in good condition. There would have been a "car shortage." Many thousands of farmers would not have been able to ship their grain and take prompt advantage of the higher prices.

Many New Locomotives and Freight Cars

But the reductions in rates sought since 1922 have not been made. In consequence, the railways have been able to buy large numbers of new locomotives and cars. In the year 1923 and in the first seven months of 1924, they bought 5,145 new locomotives and 271,397 new freight cars. They also spent a large amount of money in improving and increasing the capacity of their tracks and terminals.

These are the things that have made it possible for the railways this year to give the farmers better service than ever before in handling the crops. The benefit the farmers are deriving from this good service is worth many millions of dollars more to them than any reductions of rates that were proposed would have been.

How Good Service Can Be Continued

The kind of service the railways will be able to give the farmers will depend in future, as it has in the past, upon the way they are regulated. In order to continue to give good service the railways must be allowed to charge rates which will enable them to earn enough to pay their operating expenses, taxes, and a fair return on the value of their properties as found by the Interstate Commerce Commission in accordance with the law.

In the year 1923 their operating expenses per mile were 110 per cent more than in 1913 and their taxes per mile 162 per cent more. Rates cannot be safely reduced until operating expenses and taxes are reduced. The Railways for some years have paid more taxes than they have paid in return to their owners.

This is one of a series of advertisements published to give the farmer authentic information about railroad matters. Any questions that you would like to ask will be cheerfully answered. Address:

POULTRY On The DAIRY FARM

O. A. HANKE

Artificial Lighting for Poultrymen

The use of artificial lights as a means of stimulating winter egg production has been a great aid to poultrymen toward increasing the profit from poultry keeping. More poultrymen each year are availing themselves of this new method of increasing fall and winter egg production.

The electric light is the best of all for cost of operation, efficiency, and labor involved in caring for it. The benefits of artificial lighting are realized because of the increased amount of feed consumed due to a greater feeding period. In order to attain greater production it will be necessary to feed more whole grain for maintenance, or the body of the fowl will be depleted due to the strain of increased production.

Lighting and Feeding Pullets

Leghorn pullets should receive about 14 lbs. of grain per 100 birds daily and pullets of the heavy breeds, such as Rocks and Reds, slightly more. Pullets should not be placed under lights before Nov. 1st or the heavy early fall production will make it almost impossible to hold the birds in high producing condition through the winter.

Lighting of the hens should not be started before January 1st so that the hens may have time to finish the fall molt and regain their body weight. The regaining of the body weight is essential to satisfactory results in the breeding pen the following spring.

Installing the Lights

It is impossible to have electric lights in the hen houses in some localities, since not all rural communities have electric light lines passing by. There are several good home lighting units on the market which are not so expensive, when the home comforts due to lights are considered besides the extra profits from the layers. Under ordinary conditions a flock of 500 layers should pay for such a light plant in two seasons.

When installing the lights in the house, care must be exercised so that the perches are not in a shadow, otherwise the birds will not all come down on the floor. There must also be sufficient light so that the grain in the litter can be seen. Two 40-Watt lamps should be placed in each 20'x20' house.

Systems of Lighting

Two methods of lighting have proven most popular to date. Morning lights are superior to evening lights or to a combination of morning and evening lights. With morning lights there is less labor involved. This part should appeal to the farmer. With this system a thermos bottle type waterer should be used. Put hot water in it when grain is fed at night. This will not be frozen in the morning and the hens can drink; since an egg is 67% water, water is quite essential. Morning lights should be run from 4:00 a. m. until sunrise. With morning lights, grain should be fed four times daily in a deep litter, viz., 4:00 a. m., 8:00 a. m., 1:00 p. m., and just before dusk. The heaviest feeding must be made at dusk and 4:00 a. m. The morning feed may be thrown into the litter just after dusk.

With the evening lunch method the lights are turned on at 8:00 p. m. with a heavy feed of grain and fresh water available. This method reduces lighting expense and gives the birds more rest.

Birds should not be given more than fourteen and one-half hours of light as more than this will break them down. When operated wisely, lights are very profitable, the cost per hen per season being about five cents—the price of one egg.

The chief value of artificial lighting to the farmer lies in the fact that more eggs are produced during the season of highest prices. Probably no more eggs are laid per year but more of them are laid in the season of highest prices, making the net income per bird greater. If the farmer with a flock of fine chickens uses lights, he will probably be getting a good egg crop when egg prices are highest this winter.

Dairying in Southern California

(Continued from page 500)

er's first thought, but upon examination it appears to meet local conditions, despite admitted evils. In addition to making possible profitable operation upon very high priced land, it enables the fast-working dairyman to choose his requirements with the minimum of effort and in the least possible time creates a cash market for the wanted type of animals and tends to stabilize prices. The largest auction company guarantees the production of every cow sold and allows buyers the privilege of keeping any animal at the sale yard three days, in order to test the milk yield before finally accepting her.

Formerly the undesirable aspects of the system were more prominent than at present. Sellers were less concerned with the welfare of the buyers; dealers frequently turned over to auctioneers questionable cows, many of which were sold to inexperienced or newly-arrived dairymen. These buyers in turn were all too frequently "sold out", through desire or necessity, and the process repeated.

Now the dairy business is upon a more substantial basis and there are less true "disposal sales". The attitude of the auctioneers in respect to both this and the tuberculosis evil has been that they were acting merely as agents for owners or dealers and therefore were not responsible for results.

One factor which has contributed to improvement of conditions is the fact that a large percentage of Southern California dairymen are Americans, with a few Hollanders and Swiss, but nothing like the proportion of foreigners found in northern and central parts of the state. Southern California, therefore, is the only large section of the Golden State where the auction system could have grown to its present proportions. The average Portuguese or Italian dairyman does not readily adapt himself to this speedy business method.

It will readily be seen the auction system is by far the most important factor in the dairy industry of the Los Angeles district. It is not surprising, therefore, to find an auctioneer—"Colonel" Ben A. Rhoades—the outstanding figure in the milk industry of Los Angeles County it not in the entire southern part of the state.

Rhoades is president of the California Milk Producers' Association, said on reliable authority to control 80 per cent of the milk consumed in a district embracing 1,000,000 inhabitants. This concern did a business during the past year of more than $6,000,000. In addition to handling the milk of its members, the association controls a large creamery and distributing company. Its offices are maintained in the same building as those of the auction firm and a subsidiary supply company, while the finance company is equally close in its alliance. The Dairymen's Feed and Supply Company, the subsidiary organization, does an annual business of about $1,500,000.

The power involved in this interlocking plan is quite apparent and has been the cause of much criticism of Colonel Rhoades and the entire system he represents. However, although the veteran auctioneer is said to have amassed a large fortune from his various personal enterprises, he has promoted these organizations along co-operative lines. His popularity and the loyalty of his many friends are unquestioned.

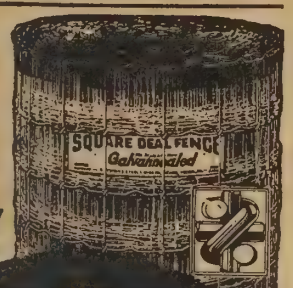
Originally the junior partner in his father's firm and now assisted by his son, Harold, "Colonel Ben" has been active in the ring for more than 25 years, and is still very proud of his ability to cry sales for five or six days at a stretch, as he has done quite recently.

There are some who do not hesitate to denounce the "Los Angeles system", as it has come to be known in Pacific Coast dairy circles. But at any rate, the auction plan is very much in the ascendency, and "Colonel Ben" is its most successful and interesting exponent.

Super Zinc-ed TRADE MARK
WIRE FENCES

"Super-Zinced" Fences are protected against rust by the heaviest armor of zinc that can be successfully applied to wire. We use our own basic open hearth steel, and by our improved process the zinc is so thoroughly bonded to the wire that it will not crack or peel. This gives superior rust resistance, and we guarantee our fences to be unexcelled in quality and durability.

Pittsburgh Perfect & Columbia Fences



are made in the Government approved styles for farm, poultry and garden, and include our superlative attractive Lawn and Flower Fences. Both Columbia and Pittsburgh Perfect Fences are "Super-Zinced", giving greater rust protection at *no increase in price*. They add to the appearance, value and *profit* of your farm more than any other investment you can make.

Good appetite
Good digestion

MORE MILK

GOOD HEALTH, good appetite and good digestion are the essentials of a good milker.

Every cow in your herd can be put in milking trim with a course of

Dr. Hess Stock Tonic

A Cow Tonic and Regulator

Your cow is a machine. To convert your grain, hay, silage and fodder into pails of milk is her function. The more she eats each day, if she is able to digest it, the more milk you get.

Dr. Hess Stock Tonic contains the dairyman's favorite remedy, Nux Vomica—the greatest of all nerve tonics—cow remedy, appetizer and digester. It contains Quassia, a stomach tonic; whets the appetite, promotes digestion. It contains Diuretics, to keep the kidneys active. It contains Laxatives, to keep the bowels regular, so that there is no clogging of the system during heavy feeding.

Just regular milk giving where Dr. Hess Stock Tonic is included in the ration.

Excellent for cows at calving time. No retained afterbirth. Feed it before freshing. Good alike for all cattle.

Buy it by the pail

Costs Little to Use

The price of one gallon of milk tonics a cow for two weeks. 25-lb. pail, $2.25; 100-lb. drum, $8.00
(Except in the far West, South and Canada)

Honest Goods—Honest Price. Why Pay More?

REMEMBER—*When you buy any Dr. Hess product, our responsibility does not end until you are satisfied that your investment is a profitable one. Otherwise, return the empty container to your dealer and get your money back.*

DR. HESS & CLARK, Inc., Ashland, Ohio

Dr. Hess Dip and Disinfectant

Keeps the Dairy and Stables Healthful and Clean Smelling

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Fistula of Teat

I have a cow that has two holes in one teat; one on the end and the other on the side. What should I do to this cow? It is very bad milking her.

I have another cow that gives 8 quarts of milk in the evening and about one-half quart in the morning. What do you think is the matter with her? SUBSCRIBER.

When the cow is dry the fistulous tract can be closed by thorough cauterization with a thermo-cautery or red hot knitting needle; or, better still, by an operation to be performed by a qualified veterinarian. Meanwhile swab the opening with tincture of iodine each other day and at milking time cover it with a wide rubber band.

The cow probably sucks herself or is sucked by another cow or calf. Make that impossible.

Taking a Blood Sample

We read with much interest your articles on contagious abortion. Most veterinarians do not know how to take the blood for a blood test. Please tell us just how to take the sample of blood, how to keep sample, how to mail it or fix for mailing, and where to mail it to for examination; also the probable cost of examining same after it is at experiment station. Could any bacteriologist make the examination? If so, of course, the price would vary?

Bristol, W. Va. O. C. H.

The sample of blood is obtained by thrusting a veterinary hypodermic syringe hollow needle into the jugular vein dilated by tying a rope fairly tight around the neck just in front of the cow's shoulder. The blood is caught in a test tube or small bottle that has been sterilized by boiling. The container is then plugged with sterilized cotton and labeled with the number of the animal and forwarded to the experiment station in the way advised by the officials. The agglutination test is applied by experts of the state agricultural experiment station or by a bacteriologist or pathologist who undertakes such work. Residents of Wisconsin are charged 10 cents per sample for making the blood test. The charge to outsiders is 25 cents per test. Particulars are given in Bulletin 368 of the Wisconsin Station at Madison and that bulletin also gives information relative to vaccination against abortion.

Johne's Disease

In one of your recent issues reference was made to a test for Johne's disease. Please give me the name of the medicine and where it can be purchased.

Evanston, Ill. E. J. B.

Full particulars about Johne's disease and testing with "johnin" are given in Bulletin 343 of the Wisconsin Agricultural Experiment Station at Madison. Johnin has been made and used with success at that station and has been supplied to veterinarians for use in suspected cases.

Garget

About six or seven months ago my cow came in one evening with one side of her udder considerably swollen. I bathed it in hot water and the next day it was reduced. About a month later the same thing happened again, and since then has increased in frequency. She has had at different times swelling in each of the four quarters. The swelling is not as severe as it was a few months ago, but it comes more often. I would like to know what you would call it. I called it garget for the lack of a better name. Now I wonder if there is anything I could do for this cow to prevent her from having this periodical swelling.

El Dorado Springs, Mo. C. E. L.

Such cases of periodic or recurrent garget are extremely common and often end in "spoiled bag". Germ infection is present in all severe attacks. The milder ones may be induced by chill, bruise, irregular or incomplete milking, indigestion, long continued heavy feeding of an excessively protein-rich ration, coming in heat, etc. Try to remove or prevent possible causes. Do not let the cow lie down on a concrete floor or cold, wet, or frozen ground. Cleanse the udder and teats before milking. Milk 3 times daily. Lessen the rich ration. Keep the bowels active. At times of attack milk once an hour and in the evening rub in a mixture of 1 part each of turpentine and fluid extract of poke root and 8 parts of unsalted lard or sweet oil. Also give the cow a dose of Epsom salts.

KOW-KARE INSURES **MORE MILK**

Here's one sign that thousands of dairymen believe in

EXPERIENCE is a great teacher. If you doubt your ability to materially add to your cows' milk production, why not prove it for yourself by an actual trial?

The winter months, with the long period of dry feeding, are a severe strain on the cow's digestion and assimilation. To get from the feed ALL the milk-value these organs must be even more vigorous than when green pasturage is available.

Kow-Kare is a medicinal invigorator that acts directly on the milk-making organs. Even if your cows are, apparently, healthy, a tablespoonful of Kow-Kare twice a day, one week out of each month will surprisingly increase the milk-flow.

For the actual treatment of such cow diseases as Barrenness, Abortion, Retained Afterbirth, Scours, Garget, Milk Fever, Lost Appetite, etc., the value of Kow-Kare is undisputed. Its success lies in its invigorating action on the digestive and genital organs—the seat of nearly all cow disorders

Prove the value of Kow-Kare this winter. Your feed dealer, general store or druggist has it—in $1.25 or 65c packages. Order direct if dealer is not supplied.

Feeding the Dairy Calf

(Continued from page 511)

to ground grain was shown by the small consumption of hominy feed.

Digestion of Starch by the Young Calf

The digestive organs of the calf at birth are fitted to utilize milk. Other feeds cannot be digested to any extent. At this time only the true stomach functions. When several weeks of age small amounts of grain and hay are taken. The beginning of the functioning of rumination undoubtedly begins at this time although this subject has not been thoroughly studied.

A study made by Woodward and Norton of the U. S. Dairy Division to ascertain how early in life the calf can utilize starch or starch-containing feeds, throws light on the subject. Beginning at four days of age each calf received cornstarch mixed with the milk for a period of three days. This feeding was continued at five-day intervals. From 4 to 7 days the calves digested about 21 per cent of the starch consumed. When 12 to 15 days old the percentage of starch digested has more than doubled, at 21 days tripled, and at 28 days was above 90 per cent. They conclude that it is quite probable that a calf but a few hours old cannot digest an appreciable amount of starch. The quantity of starch splitting enzyms must, however, increase very rapidly in the first few days of life, for the calves, when four weeks old, were able to digest a ration nearly ten per cent of the dry matter of which was starch.

Better Bulls in Connecticut

(Continued from page 499)

9,000 lbs. Only bulls from dams having such records of production have been recommended by the Extension Service.

The actual buying of all bulls has been left to the individual farmers themselves, although the representatives of the Extension Service and the county agent have given advice, as requested, and have assisted in finding available bulls. The work has been so satisfactory that it will be continued for another year.

Windham, New Haven, and Tolland Counties have not been worked to any great extent and the campaign will still be carried on in these counties. In addition, Fairfield County will be surveyed and work started there early in November.

Just what this work will mean to the future dairying of Connecticut is hard to say, but it cannot take a great amount of imagination to predict a decided improvement in the dairy industry. Not only should the production per cow be increased but there should be a decided stimulus in all dairy work, since good stock always begets good care and management. There is nothing that is of more value to a dairyman than his pride in good live stock.

Connecticut has started well on the road to successful dairying by the step just inaugurated and it is not hard to believe that 500 pure-bred bulls will have been placed by the end of another year.

Wabeek Farm Holsteins

Foundation Females For Sale

We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

WABEEK FARM, Harry Mather, Mgr.
R. 3, PONTIAC **MICHIGAN**

Bell Farm King Sylvia 297729

Now in service in the Pontiac State Hospital Herd. He combines the blood of two of the great cows of the breed, MAY ECHO SYLVIA and SUSIE ABBEKERK COLANTHA, better known as "WHITE SUSIE".

HIS DAM, "WHITE SUSIE"

Butter	7 days 35.12	Milk	737.1
Butter	365 days 1113.39	Milk	28,361.1

HIS SIRE'S DAM, MAY ECHO SYLVIA

Butter	7 days 41.01	Milk	1,005.8
Butter	30 days 169.72	Milk	3,767.3

Nearly all the females in the famous Pontiac Herd trace directly to Pontiac Korndyke or Hengerveld De Kol.

Volume LXVIII, No. 18 Fort Atkinson, Wisconsin November 14, 1924

MR. FARMER, SPARE THAT TREE

LEWIS C. FRENCH, WISCONSIN

ONE day a country of rare beauty, a section studded with jeweled lakes, hills, and valleys covered with verdure, colored as brokenly and as vividly as the field of a kaleidoscope, and the next day—vast tracts of utter desolation, a barren, unproductive waste. That is the story of the red scourge of the timber country—forest fires.

For weeks the country along the International waterways in Minnesota had been free from smoke. A trip along the historic boundary waters from Lac Le Croix, King William Narrows, Nameukan, and thence to Kabatogama—"Where the Waters Meet"—revealed a country of considerable virgin timber, the great Lake Superior national and state forests, the stretches of pine of private ownership, and here and there state controlled tracts that had been saved from the mills. It is one of a few bits of America left that carry the romantic suggestions of pioneer days.

There were mighty strands of the northern timber masterpieces, pines matchless for their beauty. It was early fall, the start of the hunting season in 1922, with the deciduous trees carrying the brilliant hues, nature's painting running the gamut. It was a country of the "red gods" where blood tingled and the chest expanded from the very fact of being alive to glory in the forests.

For three weeks there had not been a drop of rain, with prevailing south winds that dried up the swamps and woods. The leaves—red, gold, and brown—rustled and crackled under the feet with a foot or more of rich forest humus, bone dry.

Then the change. Some one was careless or negligent. Grey smoke appeared, billowing black clouds, hot and choking with flame that swept swiftly along the dry forest carpet, transforming the forest into a roaring furnace, the majestic pines into giant torches. There was a wall of flame fanned by a brisk wind that sped on across the country faster than a horse can travel, with red flames jetting out licking up every leaf, twig, brush, and tree—every living thing. The black smoke piled high into the sky in mountainous formations. Embers started other fires until the flames were spread over an area thirty miles long. It spelled disaster to the homesteaders and their pitiful small clearings; to any village or town that was in its path.

State forest rangers, husky chaps, thoroughly trained to their job, appeared as the helpless homesteaders gathered at the breaking points, hoping for a miracle to stem the tide of flames. The ranger took one look, noting the stiff wind and remarked: "All hell cannot stop that fire!" Only Heaven could with a torrent of rain or heavy snow.

But nature sent neither and the gale of wind swept the fire across country, destroying millions in timber and farm improvements. There was no stopping the financial losses. Every effort was made to protect lives.

Heroic measures were taken to stem the flames, but luck was not with the forest rangers and their aides—the homesteaders and militia. The meager handful of rangers pitted their nerve and tireless energy in the back-breaking, soul-trying, exhausting work of taming the wild fire. Fighting fires means weary miles of hiking, hours of work with the ax, hoe, or shovel, with lungs aching for air and eyes blinded by acrid smoke. They are great men, these rangers, with an inborn love for the forests that makes them hate fire and rigid in their enforcement of the too few laws to protect the timber. Nothing arouses their anger so much as thoughtless destruction of trees, regardless of ownership. They have an efficient method of detection and suppression, but any army of men could not have stopped the fires that swept over sections of northern Minnesota and southern Canada last fall.

There is a vastly different sight when the fire has passed. A burnt over area is nothing but ashes, down timber, blackened rocks, and fire debris. There is nothing left but a blackened swath of stark dead desolation that cannot grow into a green and living forest naturally within a life span of this generation. For years the twisted arms of fire-killed trees lay there, or bare "ram-pikes" stand upright, killed by the fire scars.

It is a sad monument to American neglect, a black protest against present forestry policies. No sight is more pitiful or distressing than a burned-over forest country. It is utter waste.

After seeing the destruction of fires, the importance of good forestry as it applies to the American farmer and American agriculture becomes evident. There is a lesson for every farmer and those dependent on farming in those Minnesota forest fires and others that each year destroy prospective timber and leave thousands of acres of profitless land. The average American farmer may think he is not concerned with the national forestry problem until he purchases lumber for a new home, a barn, hog or hen house. Excessive lumber prices are a drawback to modern and efficient farming. We are a nation of wood users. Without wood, the American farmer would be up against a hopeless problem.

The bare-faced fact about the timber situation, brought out in the recent report by the Forest Service, U. S. Department of Agriculture, is exactly this, "Three-fifths of the original timber of the United States is gone and we are using timber four times as fast as we are growing it". Here is something more for the farmer to think over. "The largest owner of timberlands, the largest user of timber, is the farmer. Wood means more to him than anyone else."

Here's another angle for the farmer to ponder about when he considers building a new dairy barn. There is no longer any regional competition in supplying the lumber markets. The steady process of "regional exhaustion" has gone on until the farmer in the distant East or far South must pay high freight on timber from the regions where there is but a limited supply. The remaining timber is so localized that its availability to the average farmer is greatly reduced. He must pay the price of both a depleted supply, with a growing demand, and a distant point of production. There has been a marked suspension in new construction on American farms and even in farm improvements that require lumber. It is estimated by the government that the average utilization per farm unit of lumber is about 2,000 board feet a year. There is no question but that the live stock and dairying sections

(Continued on page 544)

GUERNSEYS OF ALFRED MORAWETZ, WISCONSIN, ON PASTURE

Iowa Exhibit Compares Cows

BURTON ODERKIRK, IOWA

"USE the Axe and Avoid Financial Suicide" was stated on a placard attached to an axe suspended over a forlorn looking bovine labeled "Not a Bull—A Cow Freshener."

This was to introduce the cow testing association exhibit shown at the Dairy Cattle Congress at Waterloo by the Iowa State College Extension Service. An effigy of a financially distressed dairyman hung from the ceiling indicated that financial suicide is the ultimate fate of men who keep scrub cattle. The exhibit was impressive because the six cows, a pure-bred bull, and a plain "cow freshener" were not selected to show extremes but because they could be found on so many farms.

The purpose of the exhibit was to show the value of cow testing associations as an aid in culling unprofitable cows, to teach that, as a rule, increased production means increased net income, and to show the value of a pure-bred sire in building up a herd of high producing cows.

Next to the "cow freshener" was a plain red cow designated, "A Scrub—no record of production or reproduction."

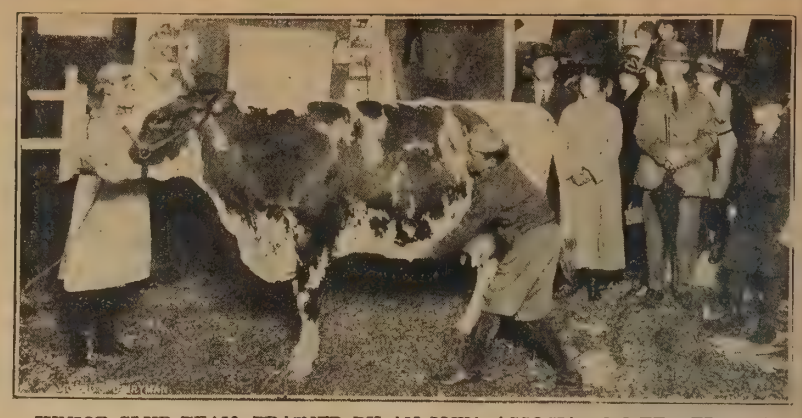
The other cows in the exhibit were grade Holsteins, the first being "Whiteface" whose color hints of a possibility of some beef breeding. She was culled when the Babcock tester and the milk scales found her unprofitable. She was purchased at an auction sale because she was fat, sleek, and carried a large udder. She calved, milked six months, and went dry regardless of good care and a well balanced ration. She produced 102 pounds of fat which sold for $54.06. Her feed cost was $59.71. Her owner lost $5.65 plus one year of labor on her and interest on $78.00.

Another cow listed in the same sale with "Whiteface" did not receive a bid in the sale ring. She was sold privately to an association member who realized that she was out of condition after a hard year of work. After two months' rest with good feed and care she calved and produced enough to pay for herself the first month besides being high cow in the testing association for the month. She was "built for business" and the tester proved her worth.

"Callie", the next cow, had appearances of being a profitable producer but she also loafed half the year. She calved March 27th and was dry September 20th. "Callie" produced 135 pounds fat, approximately the Iowa state average. It sold for $71.55 and her feed cost was $63.43. Her owner kept her one year for $8.12 or 2⅓ cents per day for his trouble. Can anyone afford to do this?

"Fern", owned by B. Ferneaux of the Pioneer Association, each year milks about ten months, rests two, and drops a valuable calf. A herd averaging the production of Fern is always profitable. She produced 318 pounds fat which sold for $90.16. Her owner made $78.38 above the cost of her feed.

"Esther", the next cow, not only has size and good type but is in the aristocratic class as a producer. She also has systematized her efforts by milking ten months and resting two. Her calves are coupons worth keeping. She produced 410 pounds fat which sold for $217.30. Her feed cost was $98.83, and her profit was $118.47.



"Jenny", a sister of "Esther", owned by Hanson and Merner of the Pioneer Association, was the highest producing cow in the association last year with 508 pounds fat, which sold for $269.24. Her feed cost was $99.15. Her owner made $170.09 above feed cost.

A pure-bred bull was shown as a contrast to the "cow freshener".

A panel exhibit gave the fact that there are now 61 test associations in operation in Iowa. Another showed a map of Iowa with the exact location of each association, most of them being in the northeast quarter of the state.

A concrete example showed one good cow to be better than a whole herd. A cow in one herd produced 400 pounds fat and netted $134.69 above feed cost for the year. In a neighbor's herd ten cows only produced an average of 118 lbs. fat and netted an average of $10.30 per cow for the year or a total of $103 for the ten cows. When one cow can net one and one-third times as much as an entire herd of ten cows it pays to test rather than guess.

Daily demonstrations on cow testing association work were given by the Black Hawk County demonstration team coached by R. C. Munkwitz, tester of the Pioneer Testing Association. This team won over all teams competing at Waterloo and placed third in competition with winning teams from other states at the National.

JUNIOR CLUB TEAM, TRAINED BY AN IOWA ASSOCIATION TESTER, GIVING A COW DEMONSTRATION AT THE DAIRY CATTLE CONGRESS

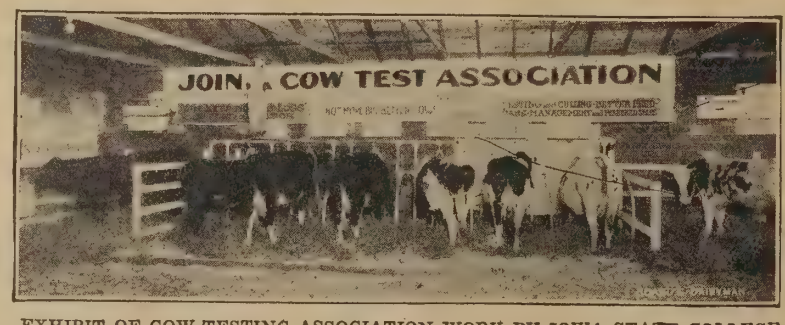


EXHIBIT OF COW TESTING ASSOCIATION WORK BY IOWA STATE COLLEGE EXTENSION SERVICE AT THE DAIRY CATTLE CONGRESS, WATERLOO, IA.

Co-operation and Co-operative Creameries in Denmark

PETER ASMUSSEN, MINNESOTA

DENMARK'S dairy industry is well organized through local, district, provincial, and national organizations. Their dairy associations, of which there are about 1335, are organized on strictly co-operative basis. Each of these operates a creamery which has a membership of from 100 to 200, and number of cows from 800 to 1,600. They are signed up under a binding contract from ten to twenty years to deliver all of their milk except that used in their homes. All members are jointly and severally liable, and must abide by the rules laid down by their board of directors and operator. They must deliver their milk clean and sweet each morning.

The first of these associations was organized in 1882, and since that time has built up their dairy industry to its foremost place in the world. Realizing that a change of experiences would be a great help in promoting their industry, they organized district associations, of which there are 23, with a membership of all of their local creameries. Their purpose is to organize butter scoring contests and meetings to discuss matters in furthering their dairy industry. Their district units are organized into provincial associations with their yearly exhibitions and meetings. Their three provincial associations form their national dairy association which represents their industry in legislation and other important matters. It also operates a statistical department and collects from each creamery information as to number of cows, amount of milk received, butter produced, expenses, etc.

For a number of years, the creameries marketed their butter through the commission merchants, but they finally awoke to the realization of establishing their own marketing organizations and organized eleven co-operative butter export associations, which again are amalgamated in a national association. In 1906 a law was passed making the "Lur" brand compulsory for all Danish butter for export. The government was given power to control the trade-mark and quality. A creamery wishing to export butter has to secure a license from the Department of Agriculture. When issued, the Department will furnish the creamery with the necessary "Lur" brand staves and printed tub circles. Each creamery is given a number. The "Lur" brand mark and number is burned into the staves of both sides of the cask, and on the printed labels. The government with the aid of the experiment stations in Copenhagen controls the quality and scoring of butter.

Managers Must Be Good Men

The Danish creamery managers and buttermakers have taken a prominent part in the development of the Danish dairy industry. Their butter exhibits, contests, and meetings are generally held jointly with their creamery associations. To secure a creamery operator's position in Denmark, the creamery operator must have at least five years of practical experience and a dairy school course, and if he is selected for the position, he must sign a contract with his creamery to make a certain score of butter the year round. If he gets more score than his contract calls for, he receives one-half of the receipts of the over-score, and if his butter does not score up to his contract, it will be deducted from his salary. Some creameries apply a similar contract, when hiring, on their fuel consumption and running expense. They give him a certain allowance and it is up to him to make or lose.

Have 861 Cow Testing Associations

Better than one-half of the cows are under cow testing association records and T. B. tested. They have 861 cow testing associations. The cow tester also supervises the farmers' barns and cows and milking utensils as to sanitation, and also gives instructions in milking and feeding of the cows. He also keeps records and supervises their sire associations and exchange of sires.

The Danish farmer has on the average one cow for every two acres of soil, and the farms average in size from 30 to 50 acres. They do not raise enough feed themselves, but import a lot of oil cake, bran, corn, and other feed from the U. S. A. and Germany.

The creameries range in size from 800 to 1,600 cows, and are all whole milk creameries. The milk is collected by a large bodied wagon and delivered every morning, every day in the week. The creameries are built very substantially of brick with plenty of light and ventilation. The floors are all of white tile and the walls and ceiling are white enamel painted with about four feet of white tile wall facing.

Butter is Main Product

The co-operative creameries in Denmark engage mostly in the manufacturing of butter and use about 95 per cent of the sweet milk received; 2.6 per cent of the whole milk is retailed, and in about 900 creameries nine per cent of the skimmilk and 2.5 per cent of the sweet milk is made into cheese, mostly for home consumption. Their payment system is practiced to make payments every two or four weeks, which is based upon their weekly Copenhagen butter quotations. The milk payment is based on fat content and weight. Normally, about 80 to 90 per cent of the skimmilk is returned to the farmers.

Rational Adjustment of Production

The economies brought about by co-operative marketing in Denmark have been affected in the functions of assembling, processing, grading, and packing. Co-operative marketing has also resulted in a rational adjustment in the agricultural production, so as

Does Not Tramp Silage

HOARD'S DAIRYMAN:—You were speaking of some one who did not spread the ensilage while filling silo. I have not had any one in silo while filling for three years. The ensilage keeps just as well. The fact is, I am afraid the man in silo would not keep on top of the corn and get buried.

Bristol, Conn. S. D. N.

Twin Calves

One of my pure-bred Guernsey cows calved today and had twin calves. Do you know whether or not they would be likely to reproduce so that it would be worth while to raise them? I have heard that twins are generally barren.

Manitowoc, Wis. G. S. G.

Twins, where both are female, will breed and twin bulls will breed; also a male twinned with a female will breed. It is so unusual that a heifer twinned with a bull will breed that we consider it unwise to raise such an animal for the small chance that she will reproduce.

Pile Spuds Shallow

"Pile the potatoes that have signs of brown rot in shallow layers and allow a free circulation of dry air. This will prevent the soft rot from taking possession of the tubers," so declares R. E. Vaughan, potato disease specialist, Wisconsin College of Agriculture.

Vaughan has just returned from a trip out into the potato fields of one section of the state and found the brown rot in every field that he visited. He is also receiving reports from other counties showing brown rot infection. It is possible that the rot infection has also spread over the south and eastern areas of the state, for it was in these localities that heavy rainfall prevailed, which coupled with late frosts helped to produce conditions that foster the brown rot growth on the tubers.

"Brown rot is a disease that invariably follows the late blight of the vines," says Vaughan. "When conditions are such that the vines continue to harbor the blight, brown rot settles under the skin of the tubers. It gives the potatoes a shriveled up appearance with a brownish coloration under the skin. A secondary condition that follows the brown rot is the soft rot. This comes about when the potatoes are dug wet and piled in deep piles. Such conditions start the potatoes to heating, and with brown rot present there will soon be a mess of soft rot that continues to spread to every potato in the pile.

"Sort out every potato that has any signs of brown rot, and then pile the remainder of the tubers into a shallow pile where there is a free circulation of dry air and there will be very little danger of the wet rot."

Use and Abuse of the Separator

HOARD'S DAIRYMAN:—There are few farm machines that are as universally used and abused as the cream separator. It is by far the most delicate and needs different care and attention than the average farmer gives it if he would get the years of service that the manufacturers build into it.

Will the separator skim clean? It will providing you operate it according to the directions. How long it will continue to skim clean depends upon the care you take of it and the material and workmanship that has been put into it. As soon as the bowl begins to vibrate the separator will begin to lose cream. It may be but a small per cent but it won't take long to run the price of a good machine into the skimmilk. Thousands of cream separators now in use are losing enough cream every few months to pay for a good machine, and the owner is ignorant of the fact.

How long will a cream separator last? That depends upon two things, the machine itself and the care you give it. If you buy a good machine it should last twenty years or more. The bowl is the heart of the machine and the part that usually gives trouble first. If the bowl becomes worn until it does not run smooth you can exchange it for a new bowl at a small cost. When this is replaced, the bowl spindle and the upper and lower spindle bearings should be examined by your dealer or a company representative. If they are found to be worn they should be replaced with new parts and then you will have practically a new machine. The other parts seldom give trouble and will last practically a lifetime if kept clean and well oiled. A good separator with proper care will run approximately ten years without giving any trouble, but in a majority of cases it would save money for the user to have the above mentioned parts renewed every five years.

What size machine should I buy? Get one large enough. There is very little difference in price between a large and a small capacity; but ten minutes saved twice a day for 365 days means over twelve ten-hour days. A large machine will last longer on account of the fewer number of hours it will have to run to do the separating. One big objection to the big machine in the past was the hard turning, but today you can buy a large capacity machine that will turn as easily as the small machines did some few years ago.

After you have bought your cream separator, study the instruction book until you know it by heart and then follow the instructions that it gives. Here are a few simple rules that if followed will save a lot of trouble:

If your machine turns hard, nine times out of ten it is the oil. Drain out the old oil, clean the bearings, and clean all the sediment out of the oil case; then refill with the best oil you can buy. Don't go to your dealer and call for just separator oil and let him dump some out of a barrel into a dirty can. Insist on getting the best oil he has in stock, even if it does cost more. It will be cheaper in the long run. Be as careful of the oil you use in your cream separator as you are of the oil used in your automobile or tractor.

Keep your machine level at all times. More machines are ruined by setting them on an unlevel foundation than by all other causes put together. Almost any machine will run good setting on an unlevel foundation for a short time, but the weight of the bowl will soon wear the spindle and bearings on the one side until the machine is ruined or cause costly repairs to be necessary. As a rule, very little attention is paid to leveling the machine, but no machine made will last as long or run as good on an unlevel foundation as it will where it is set perfectly level.

Start your machine slow. Take plenty of time starting, as jerking and heaving on the crank is hard on the machine and liable to spring some of the working parts. Run the machine at the speed recommended by the manufacturer. Always use the milk or cream screw to regulate the density of the cream. Never try to regulate the density of the cream by turning slowly or fast or by partly shutting off the flow of milk into the bowl.

Idaho. C. E. SPRADLING.

Milking Machines

HOARD'S DAIRYMAN:—The men who really enjoy milking a bunch of cows at the beginning and end of a hard day's work just for the pleasure that there is in it are few and far between. Probably it is chiefly for this reason that the minds of farm people have so long dwelt upon the hope that some day all the work of milking might be done by machinery.

The Texas Agricultural Experiment Station has just issued Circular No. 30, entitled "The Practicability of the Milking Machine", which summarizes the results which that station has obtained with the use of a milking machine and gives also the opinions of other investigators. Some of the most important facts printed in that circular are repeated here.

Mechanical milkers were invented more than fifty years ago but the early machines were crude and imperfect and it is only within the last twenty years that they have come into practical use to any considerable extent in this country. They are in more common use today in Australia and New Zealand than in the United States. There are quite a number of different makes of modern milking machines but they nearly all operate upon very much the same principles and differ from each other only in location, shape, and arrangement of the different parts.

Whether milking by machine has any influence upon the amount of milk which a cow gives has been much debated but the general consensus of opinion is that it has no influence either way, provided the cows are stripped by hand after the machine is through. In the Texas experiment there was a slightly greater decrease where the machine was used but the difference was so small that it might have been due to something else. It is probably possible to omit the stripping by hand on special occasions but it is not a good general policy because the small amount of milk left in the udder is the richest and also causes the cows to go dry quickly.

At first thought one would be inclined to expect that the milking machines would produce cleaner milk than milking by hand, but actual counts of the number of bacteria present show that it is the other way around. It is possible to produce a very clean milk with a low bacterial count using the milking machine, but it will require a higher degree of care and watchfulness in cleaning than would be required to produce the same grade of milk by hand. However, the difference is not so very great and other things have much more to do with the cleanliness of milk than the question of the use of the milking machine. Users of the milking machine cannot be too careful in the care and cleaning of the rubber parts of the machine. The number of bacteria is not nearly so important as their kind and of course the use of the machine will neither create nor eliminate disease germs like those of tuberculosis. Very likely the machines would produce cleaner milk than hand milking in dairies where the cows' udders were not washed or cleaned before milking.

The question of how long it takes to milk a cow by machine as compared with milking her by hand is of special interest, because this is the real economic reason for the existence of the milking machine. In the Texas experiment it required 7.3 minutes to milk a cow by hand and 4.6 minutes to milk a cow by machine including the time required for stripping. In other words, a man with a two-unit machine could milk a little more than three cows while a man by hand was milking two. The machine saved 2.7 minutes per cow but it required 23.7 minutes per day just for the extra washing and care of the milking machine parts. Thus a man would have to milk at least five head of cows twice per day by machine before the time saved in milking would equal that loss in caring for the machine. However, it takes almost no more time to care for the machine for thirty cows than for five and so the time saved on all cows after the first five would be a clear gain. This is the fundamental reason why machines are more successful and more practical in larger herds than in small ones. The machine saves so much time per cow milked and not a given amount of time for each machine used. Therefore a man must milk a fairly large number of cows before his saving of time can possibly equal the cost of the machine.

There are some other benefits to be obtained by the use of the machine. One or two men with a machine could milk a larger number of cows than they could possibly milk by hand, and this adaptability of the machine to times of sudden labor shortage, such as epidemic sickness, harvest time, etc., may be very valuable. On the other hand, a sudden breakdown in the milking machine in a dairy which was depending entirely on it would be very inconvenient.

During the first three years of its use, the machine cost the experiment station each year as follows:

Interest and depreciation	$ 41.45
Repairs	47.87
Power (electric)	100.00
Oil, soap, salt, and other chemicals	5.00
Total per year	$194.32

Twice as many cows could have been milked with very little increase in expense, whereas the net amount of time saved would have been more than twice as great. This makes clearer than ever why the economic success or failure of the milking machine is so dependent upon the size of the herd.

There is much variation among individual cows, some being easier to milk by machine than others, just as some others are better suited to hand milking. Probably more time will be saved with cows which are high producers than with those which are low producers because the machine is more efficient on a full or nearly full udder than the one which is nearly milked out.

In summary it may be said that the principal advantages of the milking machines are the time or labor which it saves, the pleasure of using it, and its availability in time of emergency. Its chief disadvantages are the cost of its services and the extra time and care necessary in cleaning it. Its disadvantages are very nearly constant in amount, no matter whether the herd is large or small. Its advantages increase very much with the size of the herd and with the price of labor and with the unreliability of the labor. The statement is frequently made that no one with less than fifteen cows can afford to use a milking machine and nearly anyone with more than thirty cows can afford one. This is a good general statement but may not apply to all individual cases. The cost and character of the labor supply is the biggest consideration, after the size of the herd.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Another Holstein Record Broken

There is a new Holstein champion in the junior three-year-old class of the 305-day division. Canary Snowball Gettie, bred by R. E. Ammeter, Washington, and now owned by the Western State Hospital of that state, produced 22,132 lbs. milk containing 767.78 lbs. butterfat (959.72 lbs. butter) and carried a calf for 195 days of the test.

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, D. C., Nov. 5—This industry of dairying, the largest single factor of the great industry of agriculture, and producing annually a product and a turnover which places it among the leading half dozen industries in the United States, has very large interests in almost every detail of policy and leadership which may come into effect in the establishment of the Coolidge-Conservative government which will take full charge on March 4, 1925, and which will take a preliminary test of handling the reins when Congress resumes work in December. One thing to be kept in mind is that the Congress which sits from December to March will be the same old Congress, not the new one elected Nov. 4th.

When the next Congress meets there will be complete reorganization in both Senate and House. In two key places in the House, the dairy industry becomes vitally interested, the choice of a speaker and the choice of a chairman of the Committee on Agriculture. Congressman Nicholas Longworth of Cincinnati is the most talked of candidate for the speakership. Speaker Gillette has been elected as U. S. Senator from Massachusetts, making a vacancy in the speakership which the Republicans will undoubtedly fill. Hon. Gilbert Haugen, old, tried, and effective friend of the dairy industry and all other agricultural industries, is the present Agricultural Committee chairman. He will retain this position unless entirely unforeseen conditions arise.

In the Senate there are also two key places and some additional interest in the selection of new members of some of the committees, especially the Senate Committee on Agriculture and on Appropriations. The key places are the chairmanship of the Committee on Agriculture and of the Agricultural Sub-committee of the Appropriations Committee. These places are now held by Senators Norris of Nebraska and McNary of Oregon, both re-elected. Both are likely to be continued, unless the possibility of grouping Senator Norris with the "Radical Bloc" in the Senate arises which might, in some extreme interpretations of party rules, make him ineligible for the Agricultural Committee chairmanship. Dairy representatives would view this change with some alarm, it is believed, as he has been very friendly to dairy and general agricultural interests.

Visitors to the Dairy Bureau are pleased with the new offices now occupied by the Bureau in the East Wing, ground floor, main department building.

One of the last official acts of Secretary Wallace before his death was the appointment of E. W. Sheets to be chief of the Animal Husbandry Division of the Bureau of Animal Industry. This division of the B. A. I. was co-ordinate with the Dairy Division before the latter was raised to full Bureau rank, and is the division of the B. A. I. which works most closely in connection with the Dairy Bureau. In many ways the basic work of animal husbandry and of the Dairy Bureau, in so far as they relate to animal husbandry research and the improvement of the live stock industry, are closely related. Mr. Sheets' work, of course, covers in a general way the sheep, swine, horse, and poultry industries as well as beef cattle. It is only when the research enters the special phase of milk secretion, that the real work of the Dairy Bureau is found to be separate and distinct from the general work of the Bureau of Animal Husbandry.

Mr. Sheets is a West Virginian, former head of the Department of Animal Husbandry in the State College of Agriculture at Morgantown, in which position he succeeded Dr. T. C. Atkeson, who was head of that department of college work in addition to being dean of the college for a long period.

Two paragraphs of the current summary of agricultural conditions from the November "Agricultural Situation", issued by the Department of Agriculture, will be read with interest by every dairyman who is looking ahead for information as to his side issue prospects:

"There are apparently fewer hogs in sight for next year than at any time since 1920. The corn situation indicates light weight hogs, and the trend of hog production in Europe is almost the same as here. All the factors in the hog situation seem to mean more than an even chance of higher hog prices.

"A drop in hog production might play some part in the beef cattle situation. The country is apparently still 'long' on cattle. The run of beef stock to market is heavier than last fall, and it is going to slaughter rather than to the feed lots. Cattle raisers probably are now in the most distressed position of any major group of producers."

Commenting on this a dairy expert says it is fortunate that the beef cattle market is not any too good at this time for the future of the dairy industry. If beef prices were up there would be a rush to sell dairy cows under the present low prices of butter, which would precipitate a period of violent fluctuation in butter production and butter prices for the coming year would be unhealthy, to say the least. Butter production is heavy, but this authority advises careful weeding out of poor, marginal cows, rather than any wholesale reduction of producing animals.

Strong endorsement of many dairy organizations is being received here directed to President Coolidge, asking the appointment of Hon. Charles H. March of Litchfield, Minn., to be Secretary of Agriculture. Others now receiving favorable commendation are Dr. Raymond A. Pearson of Iowa; former Assistant Secretary C. G. Pugsley of South Dakota; E. E. Faville, editor of the Western Farmer, Washington; and Howard M. Gore, assistant Secretary of Agriculture.

HOLSTEIN COW, HELM VEEMAN WOODCREST

The new world's record milk producer among 4-year-olds. In 365 days she produced 36,217.7 lbs. milk and 1,003.86 lbs. butterfat (1,254.8 lbs. butter). This is the second largest milk record for a cow of any age, being exceeded only by that of Segis Pietertje Prospect. It is interesting to note that three other cows by the same sire, Sir Veeman Korndyke Pontiac, have records above 29,000 lbs. milk and we are informed that 14 sisters of the new champion, all in the same herd, have milked over 100 lbs. a day. Helm Veeman Woodcrest is owned by F. M. Helm of Kings County, California.

League Buys More Certificates

The Board of Directors of the New York Dairymen's League has authorized Treasurer Chester Young to buy the fourth lot of the association's certificates of indebtedness, series "A", maturing in 1927. Certificates with serial numbers ending in the digit "5" will be purchased at the association's office, 120 West 42nd St., New York City, up to November 21, 1924, at 95 per cent of the face value and accrued interest at 6 per cent to November 1st. All certificates offered to the association must be endorsed across the back with the name of the holder.

The certificates which the association has previously offered to purchase were valued approximately at $1,500,000. The association was able to buy actually less than one-third of that amount.

Treasurer Young said: "Although the association is anxious in the interest of good business to buy these certificates for its sinking fund, the officers are highly gratified over the fact that the members show a reluctance to part with their securities.

"A great many certificates were turned in by persons who bought them from members who needed cash badly and parted with them at a sacrifice before the association started to make purchases. Those persons have realized a handsome profit. League members, who are refusing to sell their certificates, know that the League's finances are sound and that the interest and principle will be paid when due. They have confidence in their association's business and in their own ability to run it. They wish to cash in to the fullest extent on their own investment."—Dairymen's League.

California Dairy Show

The Pacific Slope Dairy Show, which will be held at Oakland, Calif., December 10—16, promises to be better and larger than any of its previous shows. Larger exhibits, more dairy associations, more breed organizations, more of every phase of the dairy industry will take part in the dairy show this year. When the first annual show was held at Stockton, Calif., four years ago, 9,000 square feet of floor space was used. At Oakland, this year, 35,000 square feet will be needed to care for the reservations already made. It is no small undertaking to put on a state dairy show and the leaders of the California dairy industry are to be commended for the good work they are doing and are entitled to support from all branches of the dairy industry.

Opinions, Brickbats, and Bouquets

These two columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you: It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Bureaucracy or Freedom

HOARD'S DAIRYMAN:—For a long time I was not in sympathy with your editorial position in reference to fixing prices for farm products and your position that the federal government can do but little to assist the farmers directly in securing better prices. It seems to me something could be done when the prices of farm products fall far below the prices of other commodities. Everyone seems to agree that agriculture is a fundamental industry and that the prosperity of the nation as a whole depends upon the prosperity of the farmer. I have been doing considerable thinking about price fixing, about the government assisting agriculture, and have about come to the conclusion, after reading what you have stated in your paper and from other sound and reliable sources, that this would be the greatest mistake that could possibly come to agriculture.

About one-third of the people of this country are engaged in farming and the other two-thirds are our customers. It is but natural that they want to purchase food and clothing as cheap as possible. This is the natural tendency of all people. It is also the desire of farmers to sell their products at as high a price as possible.

When I first favored the government rendering direct assistance to the farmer, it didn't occur to me that the time might come when it would be a political issue and that there would be a candidate representing the farmers' interest urging to put the price of wheat at $1.50 or $2.00 a bushel and there would be a candidate from the consumers stating he would reduce the price of wheat to $1.00 a bushel. This would make a very interesting campaign. Since customers desire to purchase cheap food, the candidate urging the fixing of lower prices would undoubtedly be elected.

I can see now that the quickest way to enslave agriculture would be to start a scheme to fix the prices of agricultural products. Your method of selling poor, unprofitable cows, efficient methods of farming, and a better system of marketing are really the solution of the farmers' problem as it is the solution of the problems of all other industries.

Then, too, there is another side to this. If the prices of farm products are fixed, then the prices of wages must be fixed, and this would mean establishing another bureau or department of government.

I am confident now that it would be a most serious mistake for the government to interfere in price fixing or attempt to regulate, in any way, the work of farmers. Let's have equal opportunity for all and special privilege to none. I can see now by attempting to regulate everything and fix prices would ultimately lead to a bureaucracy and our freedom would be gone.

Minnesota. JACK BRADLEY.

Who Is Right?

HOARD'S DAIRYMAN:—I have been very much interested in the discussions appearing in Hoard's Dairyman concerning the eradication of tuberculosis from cattle. There must be something wrong somewhere. One man boldly gives several reasons against testing while another man just as vigorously gives as many reasons in favor of testing. Apparently both men are sincere and base their ideas on personal experience, at least to some extent.

All of this tends to leave us hard working dairy farmers more or less up in the air about the whole matter. Isn't there some way in which we can find out who is right and wrong? Do cattle have tuberculosis? Is there a practical, accurate test? Can tuberculosis in cattle be spread to hogs and poultry? Can anyone tell by looking at a cow whether she has tuberculosis or not? Is there any danger of the test used infecting cattle with tuberculosis? Farmers ought to find out a little more about this testing before they go in for it.

Missouri. N. H. R.

Railroads and Six Per Cent

HOARD'S DAIRYMAN:—Some time ago I noted in your paper that the railroads are not guaranteed a 6% return on their investments. This was news to me, for I had been led to believe that the railroads were guaranteed a return on their investments. I couldn't just understand how some railroad stock could be selling so low if the owners were guaranteed a 6% return. It seemed unfair that any corporation or individual, for that matter, should be guaranteed a return on any business undertaking. It would be a snap to enter business and be assured of a profit. A man would not have to exert much energy, would be relieved of all worry; in fact, he would not have to do much thinking if the government or any other agency would come forward with money at the end of the year to pay for losses and provide a sufficient amount to guarantee a profit. This is what we are all looking for, but, after all, if any such thing were developed in this country, how long would we continue our advancement and development?

What every industry needs, farming, railroading, manufacturing, or what-not, is fair laws enacted, both by the state and federal government, permitting each group of citizens to carry on their business and give no special advantages to any group. It is unfortunate that so many people turn to the government, hoping that it can pass laws, fix prices, or that it can do this or that to increase their incomes. The function of the government should be rather to preserve order, to protect lives and property, and to permit each person to pursue his course in the securing of wealth.

I feel better satisfied with our railroad laws now, since I have learned that they do not guarantee a return to those who have money invested in them. The sooner all individuals and industry quit looking to the government for help, the better it will be for the welfare of this nation.

Illinois. R. M. P.

Never Again

HOARD'S DAIRYMAN:—You may consider me a lost son. When you tried to have me renew I took no heed, but being without your paper, I found out what a great help it really was to me. I shall never be without it again. I will subscribe for five years on that account.

Kansas. J. D. KLEIN.

Why Do They Do It?

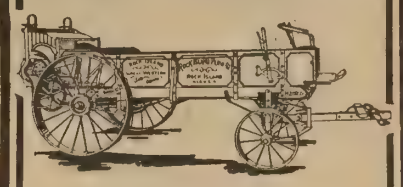
In special bulletin No. 89, of the Minnesota Agricultural Extension Division, there is found a statement relative to the causes for the variation in costs of producing pork on different farms, that we think is worth repeating.

"Cost records show that occasional farmers can sell hogs at $6 per hundred and get the market price out of 60-cent corn. Those who succeed in doing this use rations that include an adequate amount of skimmilk, tankage, or other protein feed and good clover, alfalfa, or rape pasture. In addition, they gave free access to clean drinking water, kept their herds relatively free from disease and intestinal round worms, and have convenient arrangements for feeding and watering. On the other hand, there are occasional individuals who find there is no profit in feeding 60-cent corn to $9-hogs. These farmers usually have rations that lack an adequate supply of protein found in skimmilk and tankage, inadequate pastures, and their hogs are heavily infested with intestinal worms and other parasites and diseases."

The farmer who produces pork at a loss because of his failure to give attention to crop production and feeding management, when there is a better way, is not only doing himself and family an injustice but also he is helping to depress the price of hogs to other producers because of putting a surplus on the market that was actually produced at a loss.

If the cause of this were beyond the control of these men it would not be so bad. To have successful methods within one's reach and then ignore them is bad business.

Chicory



HOARD'S DAIRYMAN:—Perhaps chicory is an acquired taste like that for sweet clover. It is one of the seeds included in the Scotch Clifton Park mixture of deep rooted plants for deepening soils and withstanding drouth I have grazed it here in Colorado. In France it is used as a soiling crop Americans think small British pastures funny, yet it is the only way to correct grazing except on land of uniform quality. So sure as a pasture contains both delicate and coarse grazing the former will be neglected and get to coarse before the cattle graze them. Even in uniform pasture land there will be such a surplus of feed at the height of the growing season that coarse patches will develop which cattle will only eat when the finer pasturage fails. Where pastures are in rotation, subsequent cropping ability from the subsoiling ability of a plant is very important. Sweet clover certainly meets the case better than any single plan and relieves us of many of the old time problems of pasture that very few ever had the patience to work out.

Mr. Farmer, Spare That Tree

(Continued from first page)

have been hard hit by the high and increasing lumber costs and that our farmers are curtailing needed farm construction. Disregarding even the serious situation of the present—what is the American farmer going to do for a timber supply ten years from now? He will either share in a sane reforestation policy, grow his own timber, or pay export prices for nearly every stick of wood he buys.

Summed up, national prosperity is endangered by the depletion of American forests and the man most concerned is the farmer.

Turning attention away from the actual needs of the American farmer for timber on his own farm, consider the amount of wood that is needed to market his products. Wisconsin cheese makers need wood, as do the California and Florida fruit growers. There is hardly a thing marketed that is produced on the farm that does not require wood somewhere along the line from the farm to the consumer.

Take merchandise that the farmer buys, furniture, farm implements, and down to newspapers and magazines. Competition has become so keen among buyers of wood and pulp supplies that they are now placing orders to secure timber "regardless of cost". The vehicle and handle industries compete with the furniture maker for the hardwoods. Implement manufacturers are now drawing upon every conceivable source—farmers' wood lots, small mills, and even specialized operations designed to secure hickory alone. The farmer pays the bill.

When the Minnesota fires were sweeping parts of the northern section, a forest ranger made this explanation,—"Here are the results of trying to make non-agricultural lands into farms ahead of the economic needs. The reason we could not stop these fires in time to prevent a loss of $3,000,000 is partly due to the policy of draining the swamps for "blue print" farms. Swamps are the natural protection of the forests against fires."

It is not my purpose to review big figures and cumbersome statistics. Suffice to say that the American farmer knows lumber is high when he flivvers down to the village lumber yard to buy a plank or order lumber for a new barn. And what is more, there is no relief in sight under present policies.

For a ten-year period, 1910 to 1920, the total area of improved farm land increased six per cent due to agricultural expansion in the South and West and the stimulus of war time demands for crop production. But in 18 of the eastern and central states the improved land shrunk at the rate of 800,000 acres per year. New England lost 32,000 farms, with a net decrease during the ten-year period of more than 1,000,000 acres. Evidently America is not land hungry, certainly not enough to rob her natural forest lands ahead of the economic time.

The forestry problem today consists of keeping fires out of the areas which will be reforested naturally and in planting other areas which are now unproductive. In the latter class much of the abandoned farm land would come.

There are 326 million acres of cut-over timber land in the United States. The condition of this land ranges from complete devastation to relatively limited areas which are producing timber at or near their full capacity. Government reports show that there were nearly 20,000,000 acres of timber land burned during 1918 and 1919. Each year the loss mounts up and it must be remembered that three-fifths of the original timber supply is exhausted. Cut-over timber land pays no taxes and produces nothing for the world.

Certainly, in view of the ravages of the fires, the reduced supply, and the mounting prices, the American farmer is interested in forestry policies. Also, the little farm wood-lot becomes a more important part of the farm. Carefully guarded, it will be a cash producer for the farmer.

A remedy for this appalling waste must be found in a concerted effort to stop the devastation of our remaining forests and put idle lands to work growing timber. It is inconceivable that the American farmer will be so blind as to forfeit the economic advantage in enormous timber growing districts and that we should go on using our once glorious forests with no provision for growing more until wood products are priced on a basis of imported luxuries.

Education in forestry is one of the crying needs. The farmer is not only concerned from a purely price and business standpoint, but forests have an immense value as watershed protection and for their ameliorating effects on climate. Timber is a regulator of water flowage. There is no wild rush of water, severe floods in a forest section to strip the top-soils. Rather, woods conserve the water for the land.

The soldier of the A. E. F. was surprised at the number of forests and wood-lots there were in France and Germany, nations starving for land. He noted that these forests were kept up with only "selective cutting" permitted. Over-mature trees were culled out but the thrifty Frenchmen never touched a tree without replacing it. The French forests were clean, for "madam" used the twigs, fallen branches, and dead limbs for the good old fagots that warmed the hearts of many an American soldier in his training area billet. The French considered their forests and wood-lots not in the terms of lumber—but in terms of soil fertility and water protection. Timberless lands in a rolling section mean a district of badly gullied farms. It does no good to put on lime, high-tension fertilizer, if the first torrent comes along and washes the top soil to the low places. Soil erosion has become a serious problem in timberless sections.

There is not much chance under present laws of lumber companies doing any amount of reforesting work. Taxes eat up any possible chance of profit except in states where timber land that is replanted is taxed only for land values until the timber is ready to cut.

"The farmers of the United States are at one and the same time the largest consumers of forest products and the largest owners of forest lands. They have the permanent interest in a systematic national plan of reforestation. They will find profit in taking their own wood-lots out of the slacker class and they may well take a hand in bringing about a common-sense plan of reforestation based upon necessary and equitable public control," states W. B. Greeley, forester.

Next time the farmer buys a "two by four" piece of pine and has to fork down deep in his jeans for the price, let him think the above statement over.

Aunt Ada's Axioms: The trouble with most education is that it aims to teach folks what to think instead of how to think.

Red Strand
(top wire)
identifies this copper-bearing, longer lasting
Galvannealed
Square Deal Fence

So that you may always know this good fence, we've marked it with a Red Strand. If the fence you buy hasn't the Red Strand then you are not getting "Galvannealed" Square Deal.

Our patented "Galvannealed" process welds an extra heavy coating *of zinc into and around the copper-bearing steel wire*. The ordinary, galvanized method used by others puts on only ¼ or ⅓ as much zinc. Because "Galvannealed" Square Deal has 2 to 3 times more zinc than the galvanized kind, it lasts 2 to 3 times longer.

This longer lasting fence is sold at *no extra price*

A postal brings official Proof of Tests from Indiana State University, Burgess Laboratories and Hunt Laboratories. They show you that "Galvannealed" Square Deal *must* outlast all other farm fences. We'll also send Ropp's Calculator, figures interest, grain, and answers thousands of farm questions — and — the Square Deal Catalog. *Write today, all three sent free to landowners.*

Co-operation and Co-operative Creameries in Denmark

(Continued from page 536)

to comply better with the consumers' demands and requirements of the market, and it also aided the producers' attention on the value and dependability in quality and regularity of supply.

Has Export Associations

Denmark has eleven co-operative export associations which are doing a successful business. The largest of these is the Danish Dairies' Export Association, Copenhagen, with 227 member creameries, and its members are scattered all over the kingdom, while the other associations restrict their membership to creameries in a limited territory. The eleven export associations are federated into one national organization, "The Danish Federated Co-operative Butter Export Association". These associations work together in carrying out certain trade policies and standards.

No Butter is Stored

The association remits to its member creamery every week the actual price received for the butter, minus the cost of operation. The creameries agree by contract to deliver its total butter production to the association for one or two years, except what is used for home consumption. The association is a non-stock association and capital needed is supplied by loans. The members are also jointly liable for any financial obligations incurred by the association. No butter is kept in storage, but clean sales are made every week. The butter from each creamery is shipped each week, usually on Monday afternoon or Tuesday morning, to the association warehouse where it is scored by government inspectors, pooled and sold by the association.

The Heifer's Udder

HOARD'S DAIRYMAN:—Well bred dairy heifers that have been well fed while carrying their first calf should freshen in good condition, but some may have caked udders. The whole udder may be caked, or one quarter or one side. Still others may have a round, hard place on the bottom or in the rear. Where large seven-day records are desired it is sometimes the practice to make no attempt to remove this swelling, trusting it will milk down and increase the per cent of fat. Where high protein feed is started too soon after calving with this kind of an udder, these hard places never disappear.

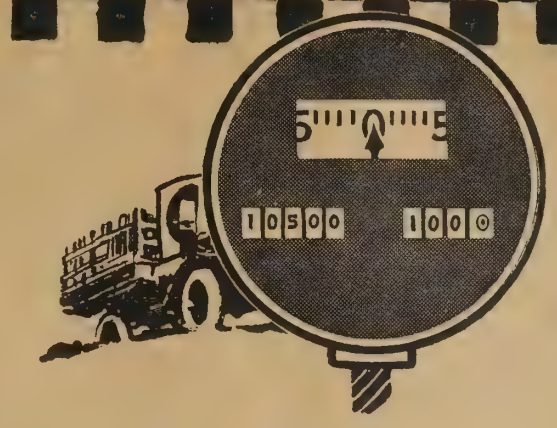
If one side is large or the swelling is low down in the rear, a tilted udder is the result.

If it is bulging on the bottom, a broken down udder is bound to follow going a little lower with each succeeding calving.

In some cases it may go so low that it is not possible to milk the cow from one side. The result is no one wants such an animal to milk or for a breeder.

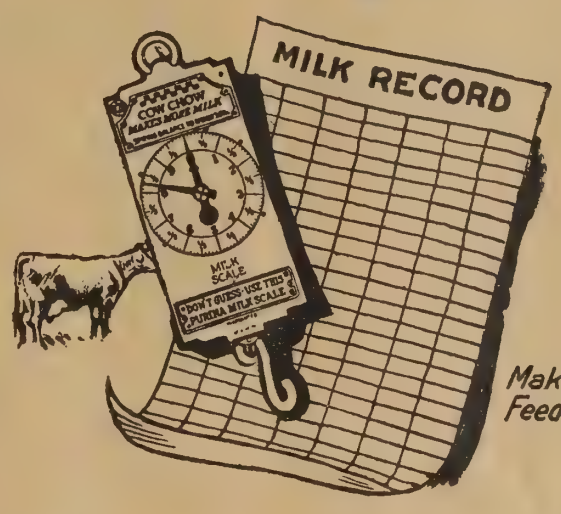
After studying the conditions that cause udders to lose their natural shape and get more deformed with each calving, we are interested to know how to check these conditions before the udder is ruined.

When a heifer's udder is badly swollen before calving, feed only light, laxative feeds for a few days before and after freshening, such as bran, ground oats, oil meal, beet pulp, or fresh beets with good legume hay and silage.



Having provided the right feeds, reduce the swelling in the udder as soon after freshening as possible. Plenty of good, hard rubbing and kneading with pressure enough so you can feel the tissue give way, will do wonders. Showering with cold water and painting the hard places once daily with iodine will help most cases.

Next in importance is to get all the milk at all times. Good milkers always massage each quarter with one hand and milk with the other to bring down the last drop of milk. This is a quicker and more thorough way than thumb and finger stripping. Get the inflammation out soon after calving and always get all the milk if you want good udders that will stand crowding for any kind of records.



If you expect a heifer to do her best as a full age cow, feed her liberally during this first lactation and as soon as her udder seems normal. If possible, milk her three times a day for at least a part of her lactation.

WHEN GAS ENGINE OVERHEATS

R. U. BLASINGAME, PENNSYLVANIA

WHEN the engine overheats the trouble may not be due to lack of water in the radiator but may be due to one or more other things which follow.

How to Clean Out Cooling System

By adding a pound of washing soda to each gallon of water required to fill the radiator and allow to remain in cooling system one day, when engine is in use, will clean out the scale, rust, and sediment. Drain the soda water and flush the cooling system thoroughly with fresh water. When draining out system, if the drain cocks are removed, there will be a larger hole, through which foreign matter can escape, than in case the pet cocks are just opened. The pet cocks have rather small holes.

Most of the water which comes from springs, streams, and wells contains some lime or other salt in solution. When the engine is run a certain amount of the cooling water is vaporized. This tends to leave a crust or layer of scale on the walls of the cooling jacket around the engine. Rain water is best to use.

This crust insulates the cooling water from the combustion chamber, in which case the heat from the engine is not carried away rapidly. Consequently, the engine may overheat and knock without showing evidence in the cooling water. Avoid boiling of cooling water to prevent scale formation.

Hose Connections

Hose connections, between the radiator and engine, are made up of layers of fabric and rubber. It often happens that the fabric will come loose and hang down in the water stream, from the engine to the radiator. Again, they tend to become flat, obstructing the free circulation of the cooling water.

The use of alcohol, glycerine, kerosene, and other anti-freezing mixtures may cause hose connections to deteriorate. Good plan to renew them each spring. Freezing of water may damage hose connections also.

Broken Water Pump

Water pumps may be broken when they are frozen up, by cranking the engine. The impeller blades run close to the pump housing. A small cake of ice will sometimes cause them to hold fast and the rod which runs the pump may twist off.

Thermo-Syphon cooling systems, such as used in the Ford engine, do not use a pump. The heated water around the engine rises and flows through the radiator by becoming hot. If the water is below the top hose connection it will not circulate, causing overheating.

Fan Belt Slipping

If the fan belt slips, because of being too loose or covered with grease, the engine will overheat. Too often the fan spindle is not lubricated often enough. It usually runs at high speed and the grease may run out and leave a dry bearing. This will cause overheating on account of belt slippage.

Thin Lubricating Oil

With the use of the heavy grade of fuel, now being sold, and especially with the use of kerosene in most tractor engines, there is considerable "crank case dilution"; that is, unvaporized fuel slipping by the pistons into the lubricating oil. The fuel destroys the lubricating value of the oil. Thus pistons rub against cylinder walls and bearings against crank shaft. This *metal* to *metal* contact causes excess heat and consequently causes rapid wear in the engine parts.

Renew the oil about 800 to 1,000 miles in summer, 300 to 500 miles in winter for automobiles; for kerosene tractors about every 12 to 18 hours. To keep down excessive dilution of the oil in cold weather, by choking the carburetor to start, pour a tea-kettle of hot water over the carburetor and manifolds. The engine will start readily. This also saves the storage batteries.

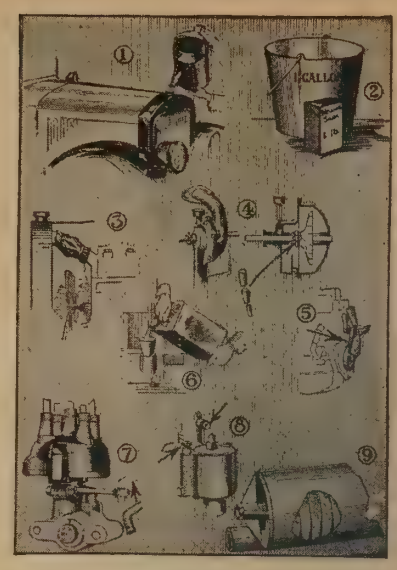
Spark Retarded

If the spark lever is retarded the engine will heat when in operation. The reason for this is that when the gas is set on fire at the time of greatest compression, advanced spark, it burns quickly. When the spark is retarded the pressure on the gas is slightly released. This causes slow burning. Advance the spark.

Incorrect Carburetor Adjustment

In case the carburetor is adjusted for too lean or too rich a mixture the burning of the gas is not rapid, when the spark occurs. This slow burning tends to heat the engine. Too rich mixtures also tend to form carbon in the combustion space of the cylinders because there is not sufficient air to combine with all the carbon of the fuel. The remaining carbon which is unburned tends to settle in the engine and on top of the piston.

Clogged Muffler



If carbon collects in the muffler and clogs it up, the free passage of the exhaust gases away from the engine is retarded. In other words, the pistons have to push the hot gases out. This back pressure on the engine causes it to heat.

Choking the carburetor when starting causes too rich mixture at carburetor. Also, running down hill with ignition off tends to clog the muffler with carbon. There is no saving of gasoline by running down hill with ignition off. The pistons are drawing in gas just the same as if ignition was on. The engine becomes too cool, fuel condenses and runs down into crank case oil, oil is forced into cylinders, and the muffler is likely to be blown off at the bottom of the hill when the ignition switch is turned on.

Clogged muffler can be cleaned to some extent by removing it and lightly tapping it with a stick and shaking out the carbon.

Carbon Deposits

Wool is one of the best insulators known. Carbon, in finely divided

WHERE TO LOOK WHEN ENGINE OVERHEATS

form, possibly comes next. When the top of the piston and the cylinder head become coated with carbon, the excess heat which is generated within the engine cylinder, at the time of explosion, can not escape readily into the cooling water. Nor it can not escape down the skirt of the piston. It is insulated by the carbon. This causes excessive heat in the cylinder and pounding is the result. This pounding causes excess pressures at the bearings and on the crank shaft. Consequently, the oil film is squeezed out of the bearings and metal to metal contact results.

Clean the carbon out by removing the cylinder head or burn it out. Cleaning is best, then one is sure that all of the carbon is removed and at the same time the valves can be ground and inspected for burning and warping.

Oil in Radiator

If oil gets into the radiator a thin film will form over the inside surface of the radiator. This oil film will tend to keep the heat in and cause the engine to heat. Don't use a greasy bucket to fill the radiator. The washing soda mentioned above will remove the oil film.

The radiator full of water does not always insure proper cooling.

Observe Golden Rule Sunday

Golden Rule Sunday, December seventh, the day set aside for furthering the spirit of good will and providing funds for Near East Relief orphans, is serving as an occasion for extensively advertising American canned milk. On this Sunday we are asked to eat a simple meal such as is served every day to Near East Relief orphans and make as large a contribution for their support as we would like to have made for us if conditions were reversed. In other words, to carry out the spirit of the Golden Rule:

"Whatsoever ye would that others should do unto you (or unto your children if left destitute) do ye even so unto them."

Near East orphan, restored to health by American condensed milk, holding in her hand a milk tin converted into a cup in an orphanage tin shop.

Golden Rule dinners bring to mind the important part American canned milk has played in saving the lives of thousands of destitute children. As a matter of fact American canned milk was an unknown product in the Near East until introduced by American relief workers.

These dinners are now being held in all the large cities throughout the country to familiarize people with the significance of Golden Rule Sunday. Orphanage ware is used on these occasions, including tin cups made from American condensed milk cans. The brims have been smoothed and handles attached by the orphans as a part of their work in industrial training classes. (Every child under the care of the Near East Relief is taught a trade.) A simple menu is served including macaroni with cheese, stewed fruit, and cocoa. On such rations costing less than five cents a day, the homeless little kiddies thrive so well that the death rate in a Near East Relief orphanage is less than the death rate in the average American city.

At one time the Near East Relief was one of the heaviest purchasers of canned milk in the country, and probably will continue to be a heavy purchaser until the orphans have become sufficiently skilled in dairying to provide for their own needs. Experts have been sent from America to teach the children scientific farming on land given over to the Near East Relief for that purpose by the Armenian and the Greek governments. American relief however has paved the way for American canned milk and it is now a successful rival of the Swiss and French brand in Asia Minor and Greece.

American condensed milk is largely responsible for saving the lives of 100,000 children. At the present time 40,000 orphans are enjoying the protection of the Near East Relief. Sixty per cent of these are less than twelve years of age. In addition to the children now being supported by American philanthropy, there are close to 100,000 children, mostly orpans, living in refugee camps without either a home or a country, a condition brought about by the expulsion of Christians from Turkey. It is to aid these pitiful little waifs as well as to continue the care of Near East Relief orphans that a general observance of Golden Rule Sunday is being advocated by President Coolidge and leaders in practically every line of endeavor.—Near East Relief.

West Virginia Dairymen Meet

The West Virginia College of Agriculture has announced the program for the third annual meeting of the West Virginia Dairymen's Association to be held at Wheeling, November 20-21.

Following the business session will be talks by J. H. McClain of Washington, D. C., and A. A. Borland of Pennsylvania State College. At 6:30, evening of the 20th, the "Dairyman's Banquet" will be held with Dr. Eugene Hardy as toastmaster. The Hon. Frank O. Lowden, of Illinois, Professor Erf, Ohio State University, and Professor E. L. Anthony, West Virginia, are on the evening program.

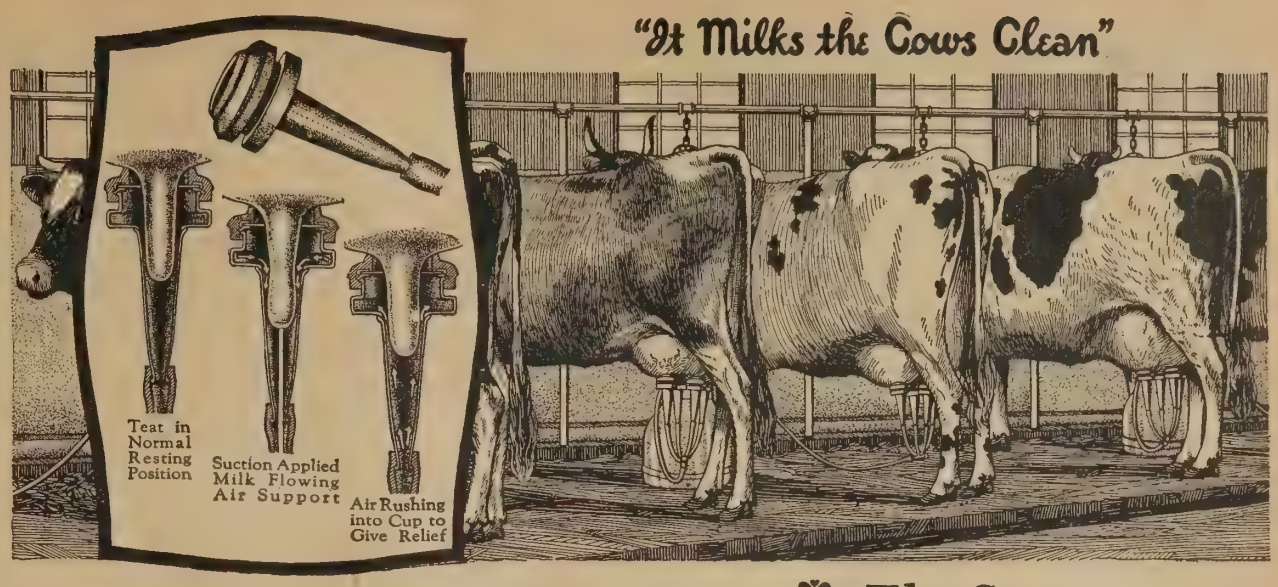
The program for the 21st is in the nature of a tour. Six stops are to be made and a number of very important subjects including equipment, crops, dairy cattle, and systems of management make up the program.

Says Sam: The best leaders in a community are usually those who don't know they're leaders.

Dairymen's League Notes

HOARD'S DAIRYMAN:—One gets letters if he writes about things that concern the farmer very considerably. Some of these letters are evidently from a sincere motive although others are doubtful. One of the former sort is just at hand and refers to my comments in Hoard's Dairyman relative to the Dairymen's League. The writer wonders whether I am really ignorant of facts or "like some others would prefer that they (facts) be kept out of sight".

It is not my purpose to plead guilty of either offense. I may not know all about the League affairs but may have given them some study. It is not my intention to keep facts out of sight. On the other hand, I do not like the attitude of some, as I see it, who would place all the blame possible for all results that may be up for criticism, rightly or otherwise, on the Dairymen's League. It does not follow that one can approve of every move made even when upholding the organization. Mistakes there have undoubtedly been and such there always will be no matter who manages.



My critic refers to what he calls the ruinous price cutting of last winter. He shields the Sheffields and blames the League. He says that in his opinion it was the League policy of dumping the greatest possible amount of fluid milk "on the platform" that did most to break prices. Here we differ. All the information that I can get that seems at all reliable goes to show that the League did not reduce the fluid price until others flooded the markets. It is true, I think, that had the League withheld all milk from the market except that which the regular fluid buyers through the pool would take, the non-poolers might have obtained higher fluid prices. Probably that is what they desired of the League and so did their patrons but League patrons also desired to sell some milk in the fluid market and some of it was offered at prices nearer those that the non-pool buyers made than had been the custom. It is my understanding that the League still held its fluid price somewhat above that at which others offered to take. In my opinion the League attempted to hold the price too high at one time. It pleased the non-poolers but a lower price was necessary. Had not others lowered very much below the League price, then the organization would not have been obliged to drop as it did. It held its fluid price the highest of any, if the information that I get is correct.

It is all a great mistake that we have these factions each trying to down the other and especially to down the Dairymen's League. This organization had done wonders considering the heavy and deadly opposition that it has had to meet. Could it have had the sympathetic attitude of other elements it would in my opinion have been able to benefit all the dairymen in the territory much more. I support it because it is the only real plan of organization that any one has put into operation. Give us a better plan that can be worked and I would be anxious that dairymen adopt it.

Then my correspondent adds: "Don't you know that there are thousands who are getting better prices at creameries and cheese factories?" I confess that I have looked anxiously and diligently for such returns. I know that such statements have been made but I do not know where they can be verified. I admit that League prices are not generally satisfactory but for the most part these prices cannot be bettered while this disastrous war goes on in its attempts to destroy all that dairymen have been fighting for these years. These prices it seems to me are better than we could have had but for the organization, but a united effort of some sort on an honest basis might have given us somewhat more. Not the prices that some demand but fairly decent prices.

What is the hardest to understand is the position of many outside the League that the League gets its members low prices and enables some few outsiders to realize more, therefore destroy the League and let everybody go into the slough together. There are some League members who feel that they would almost be willing to go in themselves in order to let these high-riders get a full share of the bumps as they would before long, if not immediately, after this sustaining power had been removed. Is it best to try it?

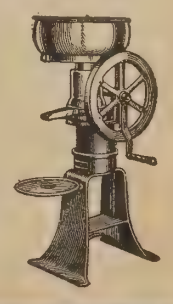
New York. H. H. LYON.

The *Perfect* Teat Cup

THE *perfect* teat cup—that's a pretty strong claim. But, practically, you cannot say less of the Burrell Air-Cushion Teat Cup. It was perfected in 1910, and, after 14 years, it still stands unequalled in satisfactory performance. Its perfection is generally recognized.

First, it is almost *universal* in its adaptability to different sizes and shapes of teats. Second, it is free from dangerous rubber linings. Third, it is made of nickel silver—simple, sanitary, light, strong. Fourth—and extremely important—it is *comfortable* to the teat. The sum of which means that the Burrell Air-Cushion Teat Cup is *the perfect Teat Cup.* Your own opinion will confirm this.

Observe the illustration above. In the upper part of the cup you will see an air space, or reservoir. When the vacuum suck is applied, the air is pulled down and forms a pad, or cushion, between the teat and cup. Then between the periods of suction, air rushes back into the air space, or reservoir, and gives complete relief to the teat.



The Burrell Air-Cushion Teat Cup is one of four features which should determine your purchase of a Burrell Milker. Send for catalog and study the others. Address Dep't. 10.

D. H. BURRELL & CO. INC. LITTLE FALLS, NEW YORK

The Separator You've Wanted

It Skims the Milk Clean

Thousands of dairymen feel they are missing the benefits of the best dairy equipment unless they are Burrell-equipped throughout. That is why they are buying this new Burrell Cream Separator—as good as the best separator Burrell ever built but selling at a much lower price. It is equipped with Burrell-Simplex Link Blades, which have never been excelled for close skimming. The Bowl Bottom is bronze. Such parts as the spindle, bearings, high speed gears, are heavier and of higher quality than is usually found in separators of corresponding capacities. The frame is simplified. The tinware is also simplified and of the high quality you are accustomed to find in Burrell products. Sizes: 350, 500, 750 and 1000-lb.-hand or power driven. *Send for catalog.*

MILKING MACHINES AND CREAM SEPARATORS

Agricultural Exports Heavy

Exports of agricultural products from the United States were greater in volume during September than in any preceding month since September, 1921, says the United States Department of Agriculture. The index number of volume of all agricultural exports in September was 158 as compared with 100 which is used as the average for the period July, 1909, to June, 1914.

The index number in July was 67, which represented the smallest volume of exports in ten years, and in August the index was 92. The rapid increase since July is due to the beginning of shipments from the new crops of wheat and cotton, and is to a very large extent seasonal, although this year the seasonal increase is greater than usual because the exportable surplus of both cotton and wheat is expected to be larger than last year.

Wheat exports in September were 32,662,000 bushels compared with 15,408,000 bushels in September last year. Exports of wheat flour in terms of grain were 7,000,000 bushels compared with 14,400,000 bushels in September 1923. Rye exports were 11,560,000 bushels compared with 2,560,000 bushels the same month last year. The increased exports of bread grains appear even more important, says the department, when it is considered that the export price of wheat in September was $1.36 as compared with $1.12 a year ago, and the export price of rye $1.23 compared with 95c last year.

Cotton exports during September were 774,000 bales of 500 pounds, being the largest September exports since 1913. Dairy products and tobacco increased over the preceding two months, but exports of pork products decreased, the exports of hams and bacon being smaller than in any month since December, 1921.

The September index of volume of all agricultural products, excluding cotton, was 229; grains and grain products, 409; cattle and meat products, 138; dairy products, 470; cotton, cake, and oil, 100; fruits and vegetables, 181.

Peter J. Shields of California is the owner of Riga of Marion Farm, a mature Jersey that recently completed a very good 365-day record.

Riga produced 760.94 pounds fat and 15,632 pounds milk in this test, and demonstrated her ability to maintain production at a uniformly high rate to the end of the twelfth month. —American Jersey Cattle Club.

How We Farm Women Make Money

A year ago last spring our home demonstration agent asked our club if we would like to try for the state prize as a Standard Home Demonstration Club. One of the requirements in the contest was that each member of the club must carry on some remunerative home project. One lady asked if our butter and eggs would be counted and she said yes, so we passed that point for without exception we all were doing something to make money at home.

When I read the request in "Can You Help?" in our page of the Dairyman, I thought surely in the varied activities of our club women there might be an inspiration and encouragement for some other home women who long to make money at home.

Several years ago, just before Christmas, we were having a little spread at the club. As an additional treat one lady brought a tray of the prettiest and most delicious homemade candy. She told us her children were selling it to make their Christmas money. She solicited our trade for our candies for the holidays. Since then her candy kitchen has grown and some of the stores in town have handled her product. She also keeps a flock of pure-bred chickens and sells lots of eggs for hatching as well as mature stock for breeders.

One day a milliner asked one of our ladies to sell her a hen for Sunday. She, knowing how busy the milliner was, running her store and house, too, delivered the hen all dressed ready for the pot. Of course the milliner was delighted and willing to pay a few cents a pound more than the hen was worth on foot. A few days later she received a telephone call saying, "Are you the lady who sells dressed chickens?" Thus through a little thoughtfulness she established a means of disposing of all her surplus poultry at a good profit.

One lady makes artificial flowers; another raises gladiolas, and these she sells to hotels and restaurants at fifty cents a dozen; the bulbs also bring in their share of the cash. She also does embroidery work for sale, specializing in bedroom sets and lunch sets in the easy new embroidery in colors on unbleached cotton. These are easily and quickly made and command a good price.

When Mrs A.'s husband grew ill she decided to help keep down the mounting expenses by taking orders for some household articles. She was handicapped by the sickness at home also because she had no way to go but to walk. She had the faith and grit to try and she won. She walked wherever she could; a neighbor loaned her a horse and buggy and soon she had a good list of customers who bought her goods regularly.

Two of our members were dressmakers. One reported the purchase of a home knitting machine; she said she found quite a little time that she could give to the work, a few minutes now and then, throughout the day. She moved away and I do not know how proficient she became, or how profitable the investment was.

The members who reported butter and eggs as their work all had secured private customers and furnished a high quality product. One lady packed her butter in the standard creamery cartons. She was able to sell it at the same price at which the creamery was selling theirs.

Another friend told me not long ago that she had gone into business. I thought that with a big house and five children to care for she had been in business for quite a while but this is what she did. Some friends told her they thought she could sell some of her home-made cakes, pies, and bread if she would only advertise them. She didn't want to put an advertisement in the paper for she said then everyone that knew her would know what she was doing, so she had some little cards printed, advertising the things she would sell. These cards she mailed to those she thought would buy. She has filled a good many orders since then and she also makes jellies and preserves to order.

Boarders furnished the money for some of the others; this work really brought in quite a bit of money for so much used on the table was raised in the farm garden.

Some women I know make it an annual endeavor to enter a large variety of home work at the fair in their county. One fall one said she had won enough money in premiums to buy all her winter clothing and the school books as well.

One fall we had a great many apples. After canning all we could we decided to dry them rather than let them go to waste. Mother had never liked the old, dark dried apples so she fixed a flour barrel on the back porch. In this barrel she put a pan with some coals and when we finished one pan of apples she would add a little sulphur to the coals and put the apples in a flour bag and hang it over the stick in the top of the barrel. Then the barrel was covered and left until we had prepared another batch. Then the first ones were spread to dry. When the apples were dry they were nice and white and cooked as white as fresh apples. We sold all our surplus to a grocer for the same price he had been selling the ordinary apples for in the store.

I believe no form of gardening pays so well and so quickly as a hotbed. One year I wanted one but could not afford to buy the sash. We took thin muslin and tacked it on a frame the size of our bed. Then we made another cover by sewing heavy burlap bags together; this we fastened to the back of the bed and tied the other corners. We started our bed about ten days sooner than usual. During the day we would throw back the heavy cover; at night it was replaced. We raised better, sturdier plants than ever before and sold far more than enough to pay for the trouble of making, besides having all we and the neighbors wanted.

Those that make a business of selling truck from their gardens try to anticipate the market, they find out what people want, and they try to have their gardens very early or very late and thus put their produce on the market when the market is not glutted and the price is high. Some of them specialize in some line, such as strawberries, pickles, tomatoes, or salad plants as their leading line. Often housewives in the town will refuse to buy from some people saying, "I always buy from Mrs. X. and I will wait for her."

There are a few things we women have learned. Big oaks from little acorns grow but they do not grow all in one night. We must be content to start small, especially if we have but little capital to invest, and be content to grow bigger. We must not despise the homely things that are around us every day. It has been said every woman can do some one thing better than she can anything else although she may feel she is not especially trained. We must each try to make the thing we like best to do be our project. We must strive to give quality—value for money received and endeavor to make people "once a customer always a customer", and last but not least we must have faith in ourselves and courage to try and try again.

Virginia. (MRS.) GRACE GORDON.

Orange Jelly

If the children came down with whooping cough just at the time when you should have been making your jelly you can at any time of year make up some from this recipe since oranges are always available Acknowledgement is made to the extension service of the South Dakota Agricultural College.

Take six oranges and three lemons, thick-skinned if possible. Peel off the yellow rind and discard but peel off the white rind and put through the food chopper. Cut up the pulp, add to the white rind, cook for one hour with 12 cups of water. Strain through a jelly bag, let stand for 24 hours and then pour off the clear liquid.

To every cup of this liquid add one cup and two tablespoons of sugar. Boil the juice eight minutes, add the sugar hot and continue to boil vigorously from five to seven minutes. If you cut bits of the yellow rind into the jelly it will have a more decided flavor.—LUCY THOMPSON.

Primrose Itch

I don't know whether or not that is the right name for it but will identify it well enough for those who have had it.

I once knew a woman who suffered all winter from a dreadful itching that at times kept her from sleeping and at all times made her desperately uncomfortable. It showed itself mostly in reddish blotches on her hands but often spread to her face and at times went to other parts of her body. I saw her a few times with her eyes nearly swelled shut with it.

Of course she tried every remedy under the sun and went to the best skin specialist in the town where she lived. He said at first that it was her nerves and then gave it other causes and finally admitted that he was entirely in the dark and advised her to see a famous skin doctor who was to visit their town the next week.

She made an appointment. The great man took one searching look at the sore spots.

"Have you any primroses in your house?" was all he asked her.

"Yes, I keep two in my dining room all the time," she replied, in amazement.

"Go home and throw them out and if I am not mistaken you will throw your itch out with them," he told her.

It was as near magic as anything I ever saw. The places began to lose their angry look the next day

(Continued on next page)

Miscellaneous Fashions

No. 1923—Attractive Design, easy to make. Cut in sizes 36, 38, 40, 42, 44, and 46 inches bust measure. Size 36 requires 3½ yards 40-inch material with ¾ yard 24-inch contrasting.

No. 1255—Child's Pajamas. Cut in sizes 2, 4, 6, 8, 10, and 12 years. Size 8 requires 2⅝ yards of 36-inch material.

No. 2183—One-Piece, Slip-On Dress. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3½ yards 36-inch material with 3¼ yards binding. The embroidery design is included in our hot-iron transfer pattern No. 720 which comes in blue and yellow and which costs 15c extra.

No. 2229—One-Piece, Tiered Dress. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 4⅝ yards 40-inch material with 7¼ yards binding.

No. 2199—Attractive Style, can be made with or without the cape back. Cut pattern off as shown in small diagram if cape back is not desired. Cut in sizes 16 years, 36, 38, 40, and 42 inches bust measure. Size 36 requires 3⅝ yards 40-inch material.

No. 2034—Costume Slip, to be made with built-up shoulders or with straight upper edge and shoulder straps. Cut in sizes 16 years, 36, 38, 40, 42 44, and 46 inches bust measure. Size 36 requires 2⅝ yards 36-inch for the slip with straight upper edge

No. 1941—Attractive Apron Style. Cut in sizes 36, 40, and 44 inches bust measure. Size 36 requires 2⅜ yards 36-inch material.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

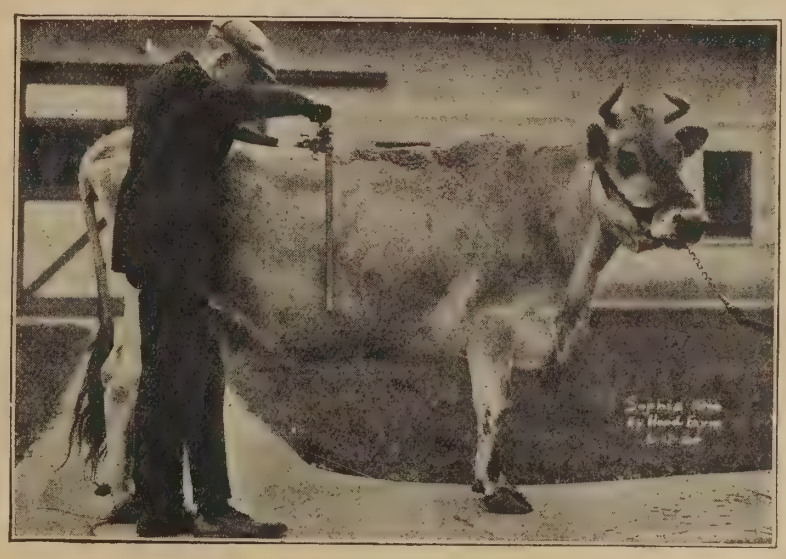
STUDY OF SOPHIE 19TH

S. R. WINTERS, Washington, D. C.

WILL the owners of dairy cows of the future be enabled to apply measuring instruments to animals and determine their relative capacity for yielding milk and butter? That is, by taking outside measurements of cows and defining these in terms of the size of their internal organs, can dairymen find out approximately the number of gallons of milk and pounds of butter that a certain cow is capable of producing?

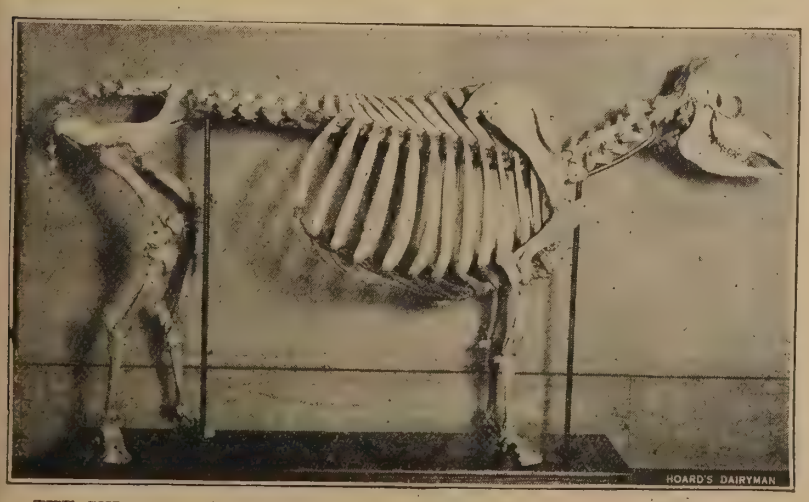
While experiments undertaken by the Bureau of Dairying of the United States Department of Agriculture do not reduce the proposition to these concrete terms, they do contemplate a relationship between the conformation of a cow and her milk and butterfat producing ability. This relation has been picturesquely referred to as that of "form to function".

The science of dairy husbandry has already determined that the ability to produce milk and butter is controlled by inheritance, but that the inheritance of our dairy cows is not pure for the factors determining high production. A method for the selection and mating of pure-bred dairy cattle in such a way as to secure cattle that will be pure-bred for these factors determining high production has not been definitely found, though we believe we have found the method whereby this can be accomplished in the use for generation after generation of sires that have proven their ability to transmit uniformly high production to their daughters. We believe we can determine the heredity of a sire in so far as milk and butterfat are concerned, if that sire has a number of daughters whose producing capacities are known more surely than we can tell the hereditary make-up of a cow from her own production record.



Now, however, cows belonging to the same family—sisters, if you will—may evidence a disparity in production of from 4,000 to 6,000 pounds of milk. This irregularity in the failure of high producing animals to unfailingly transmit their capacities for yielding relatively large amounts of milk and butter to their offspring prompts the Bureau of Dairying to study the problem from its several angles. The desired objective, of course, is to develop breeds of dairy animals that will transmit their milk and butterfat producing capacities to their offspring with the same regularity that they now impart their breed characteristics. That is, the Guernsey, Jersey, Holstein-Friesian, and other breeds of dairy cattle have perpetuated their color scheme and other characteristics by which they are unmistakably identified.

R. R. Graves, in charge of the dairy cattle breeding investigations of the Bureau of Dairying, United States Department of Agriculture, even doubts whether we really know the fundamental relationship between the conformation of certain parts of the body to the functions of the body of a cow. The skeleton of Sophie 19th, recently slaughtered and dedicated to the cause of science, has been placed in the office of Mr. Graves as the basis for studying the relation of "form to function". The carcass of this animal, once proclaimed the world's greatest butterfat producing cow, is to be installed permanently in the halls of the Bureau of Dairying.



The skeleton of Sophie 19th is probably the most perfectly preserved form of any cow in the history of dairy husbandry. Formerly, the meat of cows, whose skeletons were subject to preservation, was removed by boiling. This is likely to soften or impair the bones of the dead animal. In this instance, the flesh was taken off by a chemical process administered by an expert of the Smithsonian Institution. The removal of the flesh and the mounting of the skeleton were so skillfully executed that the body of this celebrated animal is spliced in only three places—that is, there are only three parts to the main skeleton. Even the tip end of the cow's tail-bone is intact, and the delicate bones of the organs of nose and ears were not impaired by the chemical process of removing the flesh. The truth is, the skeleton information is faithful in likeness to that great milk producing animal when clothed in the living flesh.

SOPHIE 19TH, PHOTOGRAPH TAKEN JUST BEFORE SHE WAS KILLED AND HER SKELETON DEDICATED TO SCIENCE

TAKING MEASUREMENTS OF SOPHIE 19TH

THE SKELETON OF SOPHIE 19TH, THE WORLD FAMOUS JERSEY COW RECENTLY DEDICATED TO SCIENCE, HAS BEEN INSTALLED PERMANENTLY IN THE BUREAU OF DAIRYING

Sophie 19th successfully defended the title of "World's Champion Jersey Cow" for several years. She yielded 91,869 lbs. milk and 5,280.64 lbs. butterfat during a period of seven years. Outward measurements of this remarkable milk producer were taken before she was slaughtered at the Beltsville dairy experiment farm and after being killed her internal organs were measured. In this respect, she will figure in a series of studies that are a departure. That is, under the active direction of W. W. Swett, of the Bureau of Dairying, the relation between the internal organs of a cow and her producing ability will be correlated.

"Already we have demonstrated that animals with small milk veins and wells do not necessarily have a limited flow of blood to the udder," states R. R. Graves, in charge of dairy cattle breeding investigations of the Bureau of Dairying, "that a part of the flow may be taken care of in the interior veins that are not visible outwardly.

"Even if it is found that there is a relationship between conformation and producing capacity," continues Mr. Graves, "a favorable conformation will only indicate that it will be possible for a certain animal to produce well, provided that animal has the inheritance that will stimulate large production. Since we know that inheritance governing all characteristics is transmitted through the germ plasm, it does not seem possible that we will ever be able to tell by the appearance of an animal what its inheritance for production is.

"But it does seem possible that we may be able to determine the limitations of an animal to produce by its conformation. For example, if it is found that a large heart girth is correlated with a large heart and lungs and that a large heart and lungs are essential for heavy production and an animal is found with a small heart girth, its producing capacity will be limited regardless of how good an inheritance for great production it may possess.

"Does a large heart girth really indicate a large heart and lungs; and, if so, do large heart and lungs really mean that the dairy cow having them is more capable of heavy production of milk and butterfat than a cow with much smaller heart and lungs? Also, do large stomach and intestinal capacity mean greater ability to digest and assimilate large amounts of feeds?

"When the actual relation between outward conformation of the body and corresponding organs is definitely known, and when the relationship of the size or development of certain organs and the producing capacity of the cow is known, and if these relationships are positive, then our knowledge of conformation will assist us in eliminating the animals that have a weakness that would inhibit the full development of an inheritance for great producing capacity."

A study of the outward measurements of the body and the internal organs of Sophie 19th, reinforced by observations of hundreds of other dairy cows, will enable the Bureau of Dairying to attack this problem with a definite assurance of solution. Specially designed instruments are now being built in the scientific laboratories of this bureau for determining the correlation between the outward measurements of the body and the size of the corresponding organs of a cow. This analysis, in turn, will throw light on the fundamental problem of whether there is a relationship between the dimensions of the internal organs and the relative producing ability of animals. Then, if this relationship is established with a certainty, breeders of dairy animals of the future may succeed in transmitting from one generation to another the quality of yielding great quantities of milk and butter, just as breed characteristics are now unfailingly inherited by the bovine offspring. This would be accomplished by selecting pure-bred breeding animals whose measurements of the body organs conformed to the standards prescribed by the results of the studies outlined in this article.

By producing 636.34 pounds fat and 12,765 pounds milk in 365 days, Fontaine's Golden Florence shattered the senior two-year-old Jersey record for South Carolina, and established a new, higher standard for production in this age class.

Florence is owned by Fred H. Young of South Carolina.—American Jersey Cattle Club.

Calf Clubs in Addison County

S. G. JUDD, VERMONT

ONE of the brightest spots in the field of agricultural endeavor is the encouraging growth over the entire country of boys' and girls' club work. In this movement Vermont is proud of her progress, and the writer feels that the results achieved in calf club work in Addison County are worthy of recognition, not only throughout Vermont but in the other states of the nation. While credit is due to all who have co-operated with the Addison County Farm Bureau and the State Extension Service in fostering this project, it is only fair to give especial honor to those who have carried the burden of direct responsibility: Miss Mildred B. Everts, county club agent, and F. R. Churchill, the county agricultural agent.

EXHIBIT OF THE MOOSLAMOO CALF CLUB

Starting in 1922 three clubs were organized in the towns of Addison, Weybridge, and Waltham with a membership of 21 farm boys. In 1923 the enrollment grew to 24 with the organization of a calf club in the town of Salisbury.

In selecting names for their clubs, the members largely featured points or factors of local geography or history. The club in Addison is known as Grand View; in Weybridge as Otter Creek; in Salisbury as Mooslamoo, and in Waltham as the Ethan Allen Calf Club.

These clubs have the conventional form of organization and hold regular meetings. Each member owns and raises a calf each year, taking the entire care of the animal. The boys who started in club work the first year now own three animals that they have reared, a few of their heifers being in milk.

At some of the club meetings during the year instruction in judging dairy cattle and in feeding, fitting, and exhibiting calves has been given by County Agent F. R. Churchill and S. G. Judd, the extension dairy specialist. The careful supervision of the work by Miss Everts and the inspiration of her personality kept the club members and their leaders up to their best efforts.

The Addison County Fair, during the last week of August each year, affords an opportunity for the clubs to publicly demonstrate their progress. The management provides a tent for housing the calves and offers good premiums for calves of all dairy breeds.

In 1922 the Addison County calf clubs exhibited at their county fair 18 pure-bred and 9 grade calves. This increased to 22 pure-bred and 6 grade calves in 1923. The exhibit this fall totalled 44 calves of which 38 were pure-bred animals. The above records show steady growth which has been accompanied by steady improvement in the quality of the calves.

Worthy of special commendation is the high average condition of the animals, showing the results of the careful fitting and training received from their youthful owners. In the exhibition tent the calves have been kept in a clean and attractive condition, affording a striking object lesson to some of the older exhibitors at the fair.

THE CLASS OF CALVES, OWNED BY CLUB MEMBERS, THAT COMPETED FOR THE SPECIAL PRIZES OFFERED BY THE VERMONT HOLSTEIN-FRIESIAN CLUB

Back of the boys are (left) F. R. Churchill, county agent, and (right) E. L. Ingalls, state club leader.

When the classes are called for judging, every boy has been keenly alert to show his animal to its best advantage. An observer feels that here are some expert showmen in the making.

The Holstein-Friesian breed has always predominated in these Addison County club exhibits. Special premiums are offered by the Vermont Holstein-Friesian Club. This year seventeen young pure-bred Holsteins, owned by club members, competed for these special prizes. The pictures accompanying this article will show more plainly than further words the merit of the club exhibits.

At the fair, a team selected from each club is required to compete with the other clubs in a cattle judging contest, and also to give a public demonstration on some subject related to animal husbandry. As a result of good work, at the recent fair the team from the Mooslamoo Club was selected to represent Vermont at the National Dairy Exposition in Milwaukee.

One of the finest things coming out of this work is the interest and the pride developed in the parents of the club members. No judging of the open classes at the fair has a ringside that will compare in genuine interest to that group of friends and parents of the boys that is always present when the judge places the ribbons on the club calves. In Addison County a group of interested parents has offered for next year a premium to be awarded to the club having the best balanced exhibit.

For three seasons the writer has judged the calves at the Addison County Fair, and at most of the other fairs where there are calf club exhibits. Never yet has he known a club member to protest a decision. This spirit of true sportsmanship being developed in these youngsters is a promise of better co-operation when in a short time these club boys become the farmers of Vermont and of the nation.

EXHIBIT OF THE ETHAN ALLEN CALF CLUB

The three boys to the right are brothers, sons of John Clark.

PUTTING UP WITH THE DAIRY COW

Why She Eats Instead of Being Eaten

C. F. CHRISTIAN, OHIO

"WHY, Henry! you wouldn't sell Spot," exclaimed Mrs. Henry Jones, wife of a dairy farmer. "Pa gave her to us when we were married. I don't care if she is twelve years old and hasn't paid for her feed, so the tester says, you're not going to sell old Spot."

Henry scratched his head, looked dejectedly at Spot's record of 80 pounds of butterfat and $50 worth of feed in the past six months, and muttered to the cow tester, "I guess we will have to keep old Spot. She's been a good cow in her day."

The tester turned several pages in Henry's herd record and stopped as the light from the lamp on the table fell on the telltale story of the failure of another cow to pay for board and lodging in Henry's stable.

He begins hopefully, "Here's Blackie. She is a young cow, but even figuring what she will give as a five-year-old, she will lose money for you every year. The longer you—"

"Darn it," exclaimed Henry. "I paid $80 for her at Smith's sale. She was just fresh and the best looking cow in the bunch. Here she is about dry six months after freshening. If I sell her she won't bring $30 for beef, and I hate to pass her on to somebody else."

"That's one trouble with testing. Every one of your neighbors knows that if you have a cow to sell she is no account; either she milks hard, kicks like a mule, or don't pay at the pail," says Henry, as the tester closes the records with a sigh.

"But I wouldn't mind that so much," continues Henry, "if the creamery paid a decent price for fat I wouldn't kick. It's just like everything else on the farm, the fellow that handles it makes all the money. As soon as some of us fellows that's been milking cows ever since we were big enough to sit on a stool began to make a little money, farmers that kept one cow on the place, provided their wives did the milking, got into the business. Now look where we are, flooded with milk too cheap to feed to the hogs."

Misplaced sentiment, the difference between the beef value and the mythical dairy value of poor cows, and the fear that an empty stall in the cow stable will convict the dairy farmer of being too lazy in the eyes of his neighbors to keep a lot of boarders eating at the manger which should be eaten at the lunch counter.

Sentiment has a place in the dairy business. Every city dweller upon whose doorstep a bottle of milk appears each morning as if by magic, should reverence the ground upon which the dairy cow treads, especially the lush green pastures of June, for then comes his cheap milk and butter.

In no other spot is the old saying, "A soft answer turneth away wrath, and a soft pat saves many a spilt pail of milk", more true than in the dairy barn. But, sentiment in dealing with boarder cows is as out of place as sediment in the finished product.

"Fresh cow and calf for sale, price $80," so an advertisement in the paper states. In the market report is the cheerful news: Canners and cutters—3¢ per pound.

Which would you prefer, a blow-out or a slow leak when you and the Ford are 20 miles from home and it is one hour till milking time? The blow-out is dramatic, sensational. A sharp report, followed by the shriek of brakes jammed on suddenly, heads turned your way to catch sight of a possible smashup, and a ruined tire that must be replaced before the journey is resumed.

The slow leak is a devilish thing. Your temper boils, your collar wilts. Milking time arrives, then passes into history and you are still 10 miles from home after pumping the tire for the third time.

Selling the cow that just fails to pay for her feed is put off time after time with the hope that, "maybe she will do better when she comes fresh the next time." It is cheaper to have a blow-out and turn her over to the butcher than to try to limp into good credit standing at the bank with boarder cows.

With what shame and chagrin Henry admits to his neighbor that he is only milking nine. This cringing regard for the neighbors' opinion is doubly manifest if the inquirer happens to know that Henry has room for 15 cows.

Henry Ford, perhaps the greatest organizer for production in the country, told his office force recently

Association Notes by Testers

Douglas Co., Neb.: Out of 457 cows in the association, 390 were tested during September. Three barns were painted and six were whitewashed. Eight members attended the National Dairy Show in Milwaukee. In September, market milk sold for $2.10 per cwt. and retailed at 11c a quart. —J. T. Pierson.

Gaston Co.—Mecklenburg Co., N. C.: Four herds are on official test. Seventeen members have silos, two being pit silos. Three members use milking machines. One new barn was built. One member purchased a bottling machine. Two herds were tested for tuberculosis. The cost per 100 lbs. milk ranged from $1.35 to $3.39 last month. Milk retailed for 12½—18c per quart. This association was started last June.—C. G. Midyette, Jr.

North Gratiot, Mich.: Two members installed drinking cups. One barn was remodeled with up-to-date equipment and one new milking machine was installed. The condensery paid $1.75 per cwt. for milk in September.—C. H. Blivin.

South Eaton, Mich.: L. P. Smith purchased a fine young Guernsey bull from Minnesota, whose sire's dam has a record of 952 lbs. fat. This young bull was exhibited at the recent National, where Mr. Smith made the purchase.—H. Kardel.

Alto—Kent, Mich.: One dairy barn was remodeled and whitewashed. An association tour into an adjoining county was held for the Jersey breeders. The best herds were visited by four auto loads of interested breeders. One pure-bred Jersey bull and a pure-bred Jersey cow were purchased while on this tour. The creamery paid 39c per lb. for fat in October.—D. E. Bliss.

Rudyard, Mich.: Four poor separators were discovered. Of the 188 cows tested, 11 produced over 40 lbs. fat last month. Two silos were filled with sunflowers. One modern dairy barn was built for 30 cows. Water systems, such as drinking cups, running water in front of cows, supplied by artesian wells, were installed in four barns and King System of ventilation in two barns. The creamery paid 38c per lb. for fat in October.—H. Adams.

Coleman Union, Mich.: Of the 244 cows in this association, 69 were dry, 12 produced over 40 lbs. fat., three over 50 lbs., and 12 over 1,000 lbs. milk, and four above 1,250 lbs. Twenty-six separators were tested in the last two months, only two being found in serious condition. The average production per cow is 427 lbs. milk, 17.5 lbs. fat. Thirteen members feed grain. Two milking machines were used in September. One member is remodeling his barn, putting in a concrete floor and stanchions and stalls. In September the condensery paid $1.70 per cwt. for milk.—E. G. Witkowsky.

Withee, Wis.: Wm. Gautsch has two fine three-year-old heifers which were very near the high cow for October, producing 52.8 lbs. fat and 52.3 lbs. fat. Last month the cheese factory paid from 44—52c per lb. for fat, the creamery 41—43c. Milk retailed at 8c per quart.—V. G. Loucks.

Huron—Ubly, Mich.: The high cow for September was purchased last July on the basis of her record in cow testing work in 1923. Silo filling is about completed. Fairly good yields of beets, chickory, and potatoes are reported, but beans are not turning out very well. Quite a few have cut a third crop of alfalfa which yielded well. The tester attended the National Dairy Show. One new silo was erected and filled and one barn is being remodeled. In September market milk sold for $1.60 per cwt., no charge for hauling. The condensery also paid $1.60, minus 25c for hauling.—C. M. Wagner.

Hancock Co. No. 1, Iowa: Last month one separator was purchased and several others were found to need attention. One herd reacted and was sold. Twelve members feed grain and two feed hay. Soil tests taken from fields of alfalfa and sweet clover which were making poor progress show from medium to strong acidity. Many other soil tests were taken in order to prepare the fields for this crop. The creamery paid 38—42c per lb. for fat last month.—H. W. Tiggeman.

Orange Co., Virginia, Report

HOARD'S DAIRYMAN:—The last association year of Orange Co. Virginia, closed March 31, with an average for the year of 6,418 lbs. milk and 291.5 lbs. fat. This was the highest average the association has ever had since its organization in 1914. Thirty-six cows produced over 400 pounds fat and 131 cows over 300 lbs. for the year.

The high cow for the year was a 14-year-old pure-bred Jersey cow, Marigold of Andrewsia, owned by Dr. J. S. Andrews. This wonderful old cow produced 632.1 lbs. fat and 10,193 lbs. milk on twice-a-day milking.

The high herd in butterfat production also belonged to Dr. Andrews whose herd of 24 pure-bred Jerseys showed an average of 7,548 lbs. milk and 415.4 lbs. fat.

The high herd in milk production belonged to Mr. A. C. Wamhersie with an average of 8,609 lbs. milk. This herd showed an average increase of 53.4 lbs. fat over the past year. Six hundred forty-nine animals were tested without any reactors.

It may be of interest to note that every member mixed his own feed with an average cost per cow of $71.09.—J. B. FINK, Tester.

A Cow Testing Plan

HOARD'S DAIRYMAN:—I wrote you last spring about a plan for testing cows without a regular cow testing association. You expressed the wish to learn how this work resulted at the end of the year. I furnished each owner a monthly report and yearly report on each cow. The farmers kept the milk and feed records and sent them to the Farm Bureau office monthly. They got the milk tested at the cream stations.

This was done as a free service this last year. This year we are sending out the sample bottles in corrugated pasteboard boxes to each co-operator and they are returning a sample of each cow's milk once a month to the Farm Bureau office. We will hire extra office help to do the testing and keep the records this coming year. Each co-operator will

EDITORIAL COMMENT

"ALL successful agriculture of the world has been developed around legumes."—ALFRED VIVIAN, Dean of the Ohio College of Agriculture.

What a wonderful combination is the dairy cow and legumes! Legumes build the fertility of the soil and help insure a permanent system of agriculture and the cow takes a portion of the legumes and transforms them into the most refined food for human beings.

DR. H. L. RUSSELL, Dean of the Wisconsin College of Agriculture, and Dr. Theodore Macklin of the Agricultural Economics Department of this college have gone to New Zealand for the purpose of studying dairying and the marketing of dairy products in that country. We have made arrangements with them to write us a series of articles relating the dairy practices and the plans of co-operative marketing in that country. Both of these men are thorough students of dairying, of marketing dairy products, and all factors pertaining to successful dairy husbandry. We know the articles they will prepare for our columns will be most interesting and valuable to our readers.

MUCH thought has been given to co-operation the past few years. Too many people have a nebulous conception regarding co-operation, what it can and cannot accomplish. President Bradfute, of the American Farm Bureau Federation, in a recent address said: "If I were to ask 100 men in this audience each to write on a sheet of paper his idea of co-operation, I dare say I would get 100 different ideas." He is right in this contention, unless he were associated with a group of farmers who have been engaged in co-operative effort for several years. Mr. Bradfute also said, "Let me tell you of my measuring stick of co-operation. It can be boiled down to this: He who would co-operate must first adjust himself so other men can co-operate with him." It was Pat who said, "Bridget and I are one, and I'm that one". This does not express co-operative sentiment. To make a success of co-operative effort, each person must yield in his views and then be ready to support the composite idea of all people in both fair and bad weather. Co-operation is not a ready-made coat that can be put on and worn, it is something that must be made and developed.

MINNESOTA CREAMERIES REVOLVING FUND

To create a revolving fund, the Minnesota Co-operative Creameries' Association reserves one-half cent per pound on all butter it sells. It then issues certificates to each creamery bearing 6 per cent interest. The reason for this revolving fund is to pay member creameries promptly and this necessitates capital, for the purchasers of butter do not pay for all butter soon enough to permit prompt payment. The association started with small means, but it has been able to borrow from banks that it might pay the creameries promptly for their butter.

It is not a good practice for any co-operative organization to run constantly on borrowed capital. Every sound and well managed business institution builds a reserve, for it would be rather an unusual institution that did not find itself passing through lean years.

According to A. J. McGuire, general manager of the Minnesota Co-operative Creameries' Association, some creameries wonder whether these certificates are worth their face value. He refers any creamery manager who doubts the value of these certificates to the Northwestern National Bank, of Minneapolis, and the Merchants' National Bank, of St. Paul. We consider it wise for managers of co-operative enterprises to keep their members constantly informed upon what is being done and we like the way Mr. McGuire presents to the creameries who are members of the association what is being done and the reasons for doing it. Silence regarding an organization may be a fruitful source of extravagant stories and create in the minds of the members a distrust which has in more than one instance proved fatal. Providing the members with full information and a sufficient revolving fund to carry on the business of any co-operative enterprise are highly essential to its success.

GOVERNMENT CONTROL OF CHILDREN

The proposed child labor amendment is as follows:

"Section 1. The Congress shall have power to limit, regulate, and prohibit the labor of persons under eighteen years of age.

"Section 2. The power of the several states is unimpaired by this article except that the operation of state laws shall be suspended to the extent necessary to give effect to legislation enacted by the Congress."

It seems clear to us that if this amendment is ratified by the several states, Congress will be given more power than simply regulating child labor. It is given the power to prohibit the labor of persons under eighteen years of age. It is also clear that any law enacted by Congress will impair the state laws if they in any way conflict with the national law; in other words, the national labor law will take precedence over the state law.

Some believe that this amendment, if ratified, will not apply to farm children. It must be remembered that when the resolution was being considered in the House of Representatives, an amendment was offered which is as follows: "Provided that no law shall control the labor of any child in the house, or business, or on the premises connected therewith, of the parent or parents." This amendment was rejected and another was offered, as follows: "But no law enacted under this article shall affect in any way the labor of any child or children on the farm of the parent or parents." This amendment was defeated. We see no reason for anyone drawing the conclusion that if the proposed child labor law is ratified, it will not apply to farm children.

Miss Julia Lathrop, when chief of the Children's Bureau at Washington, said: "I do not think any English authority can possibly realize the eagerness with which we have watched the progress of the Fisher Bill through Parliament, because we saw at once that somebody in England had had the courage to do a thing which nobody in America has been bold enough to do, which was to try to cut, by an indirect attack, the root of rural child labor. The great advantage to us in a discussion of this English measure is that it shows us a way to standardize education in the interest of the future and at the same time to get rid of the one thing we have never dared to attack—rural child labor."

Here again we have evidence that the people who would prohibit children from working until eighteen years of age would have it apply to rural communities as well as to factories. We do not believe in extending any such power to Congress. We do believe that states should have reasonable child labor laws, and the most of them have. It is a crime to us to work children long hours in factories and mines and at many other occupations, but it is a greater crime to enact a law preventing a person from working until they are eighteen years of age. It would be rank injustice to the child and would be conducive to producing weak and incapable men and women. The Ohio Farm Bureau has stated: "Idleness by law is as repulsive as enforced servitude."

The National Grange is opposed to any exploitation of child labor, but it is opposed to the child labor amendment now before the states for ratification. We should have enacted by all states a reasonable child labor law and it is better for the states than it is for the federal government to have such laws. There is a tendency everywhere to take responsibility away from the people and lodge it in some department of government. This is not only leading to conditions that will weaken our people, but it is inflicting heavy expenses upon them. Every time a new department of govenment is established, it is not long before millions are required to sustain it. If the proponents of this amendment simply had in mind regulating labor of persons under eighteen years of age, why would they bring into the amendment the word "prohibit"?

It is plain to see that the real motive for this amendment intends to prohibit the labor of all persons under eighteen years of age. We are opposed to it, for the evils it would correct are far less than the evils it would create.

DAIRY PRODUCTION

"Dairy production has been increasing in recent years in virtually all countries the world over," states the United States Department of Agriculture, "due to the general profitableness of dairying as compared with other farm enterprises. The general depression in the European margarine industry gives added evidence of heavy world production of butter, it is pointed out.

"The most recent growth in dairying has taken place in the comparatively new and unexploited countries, including New Zealand, Australia, and Argentina, and there is every reason to believe," says the Department, "that this expansion is of a substantial and permanent nature.

"Dairymen feel that production will continue to increase throughout the world and that more consideration will have to be given the demand side of the situation."

We shall not only be required to give more attention to the demand for butter, but more attention to the character of the cows we keep and the kind of crops we raise for them. The 300-lb. fat cow will have to replace the 150-lb. fat cow. Alfalfa, sweet clover, or red clover will have to replace timothy. Our tariff on dairy products helps to protect our home markets but it is of no advantage when butter is exported to other countries. At present we are exporting butter to foreign lands and this is bringing us in direct competition with all the nations of the world that are exporting butter. The only way we can compete with such conditions in the world's market is through the use of better cows given better care and better rations.

GOOD SALESMANSHIP ESSENTIAL

A short article has just been received from a correspondent which discusses a vitally important problem in the development of the dairy industry. The question raised is: Why do not more dairy farmers make use of the services rendered through cow testing association work?

Cow testing association work is sufficiently sound in principle that Danish dairymen after 40 years of dairy development have recognized its importance to the extent that it has become a permanent factor contributing its services to the owners of more than half of all the dairy cattle in that country.

The author of this article suggests that an analysis of the reasons why more dairymen in the United States are not members of cow testing associations indicates a possible weakness in salesmanship methods or material in convincing dairy farmers of the value of the work. The farmer may agree that the work is all right but this does not help him to actually eliminate the cows from his herd that are losing money. He wants definite, concrete, understandable information on what the work may actually mean to him in net cash. The only source for the basis of a selling argument to meet this attitude is from the many experiences in the work. There certainly is no lack of information of this kind.

Men who are engaged in promoting cow testing association work have a great opportunity and no less a responsibility. They have a fundamentally sound piece of goods to sell. They have plenty of evidence to draw from in developing their selling arguments.

The use of the best possible salesmanship methods in selling cow testing work to farmers is worthy of careful consideration by every one who is charged with more or less responsibility in developing this great work.

A Cow Testing Plan

(Continued from page 539)

part of the expense. The Farm Bureau will pay the expense for equipment of the tester.

Sixty-three cows in nine herds were tested the first month under the plan in operation last year. Of these, 35 cows in six herds finished a year's work with an average of 292 days on test. The average production was 5,158 lbs. milk containing 205.6 lbs. fat. A grade Jersey owned by F. J. Armstrong took first place with a production of 6,042 lbs. milk containing 304 lbs. fat. The ten best cows produced an average of 268 lbs. fat, giving an income of $82.33 above cost of feed. A herd of the ten best cows would pay their owner $68 a month for his labor, while a herd of the ten poorest cows would pay only $20. Why take a thirty-cent dollar for wages with poor cows?

Last year an average Accredited Poultry Flock of 131 hens brought a total return of $487.22, or a net return above feed of $368.50. Four cows brought a total return of $408.92 and a net return of $199.92. Eighteen hens were equal to one cow in net returns.

L. C. CHRISTIE, County Agent.
Nebraska.

Annual Report of Flathead Shows Progress

The first annual report of the Flathead, Mont., Cow Testing Association, organized July 1, 1923, made by E. R. Ford, tester, shows that a total of 36 herds, containing 586 cows, were tested with an average production of 7,443 pounds milk and 284.7 pounds fat for 247 cows tested for ten months or more.

While the average cost of producing fat was 22½ cents per pound, it is worth while to note that the lowest average cost of production for herds made is 15½ cents and the highest is 30 cents per pound. The most economical cow produced fat at a cost of 10 cents per pound and the most expensive cow produced at a cost of 46 cents per pound.

The highest herd, consisting of two pure-bred Holsteins, averaged 17,103 pounds milk and 522.7 pounds fat.

The highest cow for the association for the year was Johanna Aggie Homestead, the registered Holstein owned by O. K. Iverson. She produced 25,018 pounds milk and 673.2 pounds fat in 11 months. Fifteen cows produced over four hundred pounds fat in the year.

Alfalfa formed the bulk of the hay ration for most members of the association, 25 of them in fact feeding only alfalfa for hay. Twelve members fed either corn or sunflower silage. E. R. FORD, Tester.

Wisconsin Taxes Are Too High

EVERY citizen, whether a property owner or not, is a stockholder in Wisconsin. As such, he should learn the facts about taxes, because part of the cost of government comes out of his pocket. We all know that taxes are high for everybody. Tax burdens can be reduced if we adopt a program of:

1. **Economy in Government, State, County, Local.**
2. **Spread the tax load by increasing property values through the promotion of agriculture and industry.**
3. **Solve tax problems by economic facts and not politics.**

What Wisconsin needs is not higher taxes on any person or class, but lower taxes for all.

The way to solve our tax problem is to cut the burden and not shift it onto industry.

Wisconsin industry now pays higher taxes than in any other industrial state. Special taxes on corporations in Wisconsin are twice as high as in Michigan, four times as high as in Ohio and twelve times as high as in Illinois.

Indiana, Iowa and Minnesota do not levy any special corporation tax. These are nearby competitive states.

All Wisconsin industry asks of our people is a square deal so that it can hold its own in competition with 47 other states of the Union.

Wisconsin Manufacturers are placing these facts before the people so that we can all work together in promoting better conditions in agriculture and industry. This will mean prosperity for every citizen.

FARM AND FACTORY MUST PROSPER TOGETHER

Pure-bred Sire Proves Worth

The surest, quickest, and cheapest method of increasing the production of a dairy herd for the average farmer is by the use of a good pure-bred sire. This fact is clearly brought out by the records of a herd in the Fairfax County, Virginia, Cow Testing Association No. 1.

Several years ago a pure-bred Holstein bull of very good breeding was placed at the head of the herd belonging to Mr. Retzer. At the present time Mr. Retzer has a yearly cow testing association record on five of the daughters of this bull, as well as the cow test records of the dams. To make these records comparable, records of daughters were brought up to maturity by the method used by the U. S. Dairy Division. The five dams showed a total production of 31,998 lbs. milk and 1,245 lbs. fat or an average production of 6,400 lbs. milk and 249 lbs. butterfat with an average test of 3.89 per cent. The five daughters showed a total production of 51,857 lbs. milk and 2,086.1 lbs. fat or an average production of 10,371 lbs. milk and 417.2 lbs. fat with an average test of 4.02 per cent; the average increase in production of daughters over dams being 3,971 lbs. milk and 168.2 lbs. fat, or 62 per cent increase in milk and 67.5 per cent increase in fat production. This past year Mr. Retzer has received a farm price of slightly over $3 per cwt. for his milk which is sold as fluid milk. At this rate the gain in production of these five daughters of almost 20,000 lbs. brought a return of about $600 in excess of their dams or an average of $120 per cow for one year.

In addition to greatly increasing the production and raising the butterfat test, there was also a very marked improvement in type and characteristics which are indicative of good dairy animals, as well as breed characteristics. As a matter of fact this bull was so prepotent that even when bred to common red cows, as was the case in two of the instances, his daughters gave every indication from color type, markings, and conformation of being pure-bred Holsteins. His daughters are also very uniform, especially considering the very uniformity of their dams. He has also given especially fine udders to all of his daughters. Of course, as so often is the case, he passed into the hands of the butcher long before his real worth was known.

In light of such instances as this it is hard to understand why so many farmers still persist in keeping scrub bulls. The 1920 census shows that we have in the United States about 752,371 males of which 187,299 or about 25 per cent of them are pure-breds. The Virginia census showed that there were 8,207 dairy bulls in use, of which 2,251 or only about 27 per cent of them being pure-breds. Why not butcher the grade or scrub bull and replace with good pure-bred?—L. P. EMERICK.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

A Word on Fistula

The term "fistula" means an abnormal pipe, sinus, or tube-like canal or duct discharging pus or some other secretion. The most familiar fistula is that of the withers in the horse and that is usually caused by bruising. "Poll evil", of the horse, is of similar nature.

Some owners may also have seen a fistula of the large salivary duct that crosses the lower jaw of the horse and is known as Steno's duct. That discharges saliva and is a good illustration of a fistula of a secreting gland. To the owner of dairy cows fistula of the teat wall is the most common condition of the kind in question. Through it milk leaks or runs at milking time or before milking is done. That, too, is a fistula of a secreting gland or its duct and fistula of the mammary secreting gland, or udder, is also occasionally met with. In at least one case that came to our notice there was a fistulous opening connecting the front and rear quarters of one side of a cow's udder. One teat was "blind". The other emptied the blind quarter.

There are two other kinds of fistula to which we wish to draw attention at this time. The first of these is that which habitually discharges pus and fails to dry up and heal despite injection of caustics and astringent disinfectants. Fistula of that nature may occur at any point on the body. The most commonly met with are located at the point of the hip, the pin bone of the rump, the muscular part of the shoulder, and the upper flank on the left side of the body or on the leg, below the knee or hock. A less common fistula is that between the rectum and vagina, or connecting with the rectum from an outside orifice.

When pus constantly oozes or discharges from a fistulous sinus or tract, some irritative cause usually is present. Often we find that a foreign body keeps up the flow of pus. It may be a sliver, snag, bit of broken bone, diseased bone, hair, dirt, grit, or dead or diseased cartilage. Beards of barley or foxtail or the sharp needles of needle grass, or spiral ones of alfileria may also give rise to formation and discharge of pus. A diseased or split molar tooth may also have a fistulous pipe running out of the jaw and discharging pus.

In view of these facts the first step in attempting remedial treatment of a fistula should be to probe for the cause. In a long-standing case of fistula of a teat wall we found on probing that a milking tube had been "lost" in the teat, had crumpled up and become corroded. Had it been promptly discovered and removed, a fistulous tract would not have formed. Probing of fistula of the face, jaws, point of the hip, or ischium, of the rump, often discloses the presence of diseased bone. The offending body, whatever it may be, must at once be removed by enlargement of the opening, scraping, elevation of bone or use of forceps, as the condition may require. Healing should then proceed rapidly, provided the wound is well disinfected and then kept clean, with free drainage for pus or other fluid. A fistula of the upper left flank sometimes follows tapping with a dirty trocar and canula or a knife-blade to relieve bloat. To prevent that the seat of the operation and the instruments should be sterilized at the time of operation. The trocar should also be returned to the canula and both slowly pulled out together, when the gas has escaped, to avoid feed being deposited in the wound by capillary action of the tube.

Hard Milker

I have a cow that gives a big flow of milk but milks very hard. I am writing you to see if you have any remedy for such cows.
Taylorville, Ill. H. S.

The exact cause of hard milking has to be determined by examination that appropriate treatment may be prescribed or applied. If all of the teats are equally affected, the ducts being abnormally small, dilators persistently used may improve the condition. If but one teat is affected, growths or a stricture may be the cause. When just inside the opening growths may be removed by operation but when located higher in the teat it is best to let a calf nurse or to dry off the secretion in that quarter. When a stricture does not respond satisfactorily to use of a dilator or teat plug, it may be slit down through in four different directions with a teat bistoury. Instruments used must be carefully sterilized before insertion. Better have a veterinarian decide what treatment is necessary in this particular case.

SPOHN'S DISTEMPER COMPOUND

Don't take chances of your horses or mules being laid up with Distemper, Influenza, Pink Eye, Laryngitis, Heaves, Coughs or Colds. Give "SPOHN'S" to both the sick and the well ones. The standard remedy for 30 years. Give "SPOHN'S" for Dog Distemper. 60 cents and $1.20 at drug stores.
SPOHN MEDICAL CO. GOSHEN, IND.

It Pays To Dehorn

He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.
THE GOLDEN GLOW JERSEY FARM KENSINGTON, MD.

The Difference

Mother was very careful indeed about the upbringing of her little son, Tommy. Particularly careful was she to make him say grace before each meal.

Recently in a restaurant, after the waitress had served the tea, mother said to Tommy:

"Now, say grace, please, Tommy."

Tommy looked up in surprise.

"But, mamma," objected the small boy, "we're paying for this, aren't we?"—The Progressive Grocer.

GUERNSEYS

The TYPE *Plus* PRODUCTION SIRE

ARE OFFERED FOR SALE. Both are serviceable, born in September, 1923, and are out of granddaughters of Beda's May King. One with a record of 590 lbs. fat in FF. The other died shortly after being started on test. Excellent individuals, nicely marked. PRICED AT $1,000 AND $500 respectively.

That most coveted place, 1st get of sire at the National, has been won 4 times in the last 6 years by the get of Ladysmith Cherub.

BUY LADYSMITH CHERUB BLOOD.

SHOREWOOD FARMS, CRYSTAL BAY, MINNESOTA.

This Blood Sells Fast!

Our bull calves are either sons of Anton's King Confidence or out of his daughters. They sell so rapidly that only in rare instances are we able to keep them until they are old enough for service. If you want a bull possessing this blood to head your herd, buy a calf six months' old, raise it yourself and save money. A. K. C. has gained a reputation for siring mighty good udders along with the other desirable characteristics. A bull of our breeding will make money for you and improve your herd.

Saved $5.00 A Month On Butter Alone
With My RENFREW Scales

"The RENFREW Truck Scales has saved me $5.00 every month I have used it on butter products alone. It surely is worth the price you ask for it. It's a bargain and if a farmer uses it a month, he will never part with it."
—Henry Van De Slunt

The RENFREW Portable
Weighs Anything from a Pound to a Ton

The RENFREW is a portable weighing machine, as easily handled as a wheelbarrow which weighs anything from a pound to a ton, with absolute accuracy. You can weigh a steer, or a hen—a pound of butter, or a horse—a sack of oats, or a load of loose hay. Instead of carrying the things to the scales, you wheel the scales to them. That's why the RENFREW has proved such a popular money-maker and money-saver for thousands of farmers, as well as a time and labor saver.

Only $7.50 After 30 Days' FREE TRIAL

You don't have to send us a cent until you have used the RENFREW as your own for 30 days. If you decide that you want to keep it you send us only $7.50 and pay the balance in small monthly payments.

Write Today for Free Catalog

Our new catalog—just off the press—tells about this wonderful scales. It is FREE. Ask for it TODAY!

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

and in a week they were gone for good. That is more than six months ago which is long enough to prove that the doctor knew what he was talking about. You may be able to have primroses in your house with perfect safety as it is only certain types of skin that they affect. Even if your skin is sensitive to them they will probably not do you any harm unless you handle them with bare hands. If you are bound to have them, rubber gloves will probably make them harmless.—LUCY THOMPSON.

Cottage Cheese With Pineapple

"Oh, yes, I like cottage cheese," is what almost anyone will say on being asked but they don't honestly mean it. They only mean that they do not really dislike it.

It is such an easy food to have and so very valuable from a health standpoint that it is worth while having now and then anyway even if people do not exactly shout when they see it. It can be dressed up in certain ways that make it really delicious though it would not do to serve it every day.

Someone told me about using it with pineapple and we liked it better than usual. Take grated pineapple and mix it with the cheese instead of putting in cream. It will want a little salt, too. The juice that clings to the pineapple will provide all the softening necessary. That is best served as a salad on lettuce leaves with a dressing that is slightly sweetened.—LUCY THOMPSON.

A Handy Wife

Jack: Can you cook and sew and sweep and keep house?

Mary (expectantly): Yes, indeed!

"Well, when we're married you oughtn't to have any trouble finding a job!"—*The Progressive Grocer.*

For Christmas Gifts You Could Make

Every man gets plenty of ties for Xmas, but the fact that he needs a shirt more than a tie seems always to be overlooked.

Cuddly rag toys are easy and inexpensive to make. Small children are crazy about them.

A pretty pillow is a gift that every woman would be greatly pleased to receive. These are easy and cost little to make.

These gifts are not at all hard to make, and in addition to being less expensive, there is greater sentimental value attached to a home-made gift. In our Fall and Winter Fashion Magazine, the above gifts, in addition to others, are shown; also about 300 styles of dresses, aprons, coats, children's clothes, etc., and, of course, patterns are obtainable of all. This book is offered to readers in order that they may have an opportunity to choose from a large variety of styles and save money in making the clothes and gifts. To obtain one of these books, just send 10 cents, in stamps or coin, to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis.

Save the Surface of Your Teeth

It pays to save the enamel of your teeth just as it pays to save the surface of farm buildings and machinery. Tooth enamel protects the surface of the tooth. It is the one substance that nature can't replace.

Dentists recommend a dentifrice which "washes" the teeth. They tell you to avoid using one which contains harsh grit.

Colgate's Ribbon Dental Cream "saves the surface" of your teeth. *It removes causes of tooth decay.* It is a safe, common sense dentifrice. More dentists recommend Colgate's than any other dentifrice.

DAIRY MARKET NEWS

Cheese Market

(Report by U. S. Dept. of Agr.)

Primary cheese markets developed a firmer trend during the week, responding to the influence of somewhat lighter receipts at country markets. Firmer tone of butter markets also appeared of some support. Wholesale distributing markets remained generally quiet.

The average wholesale prices on American cheese, style Twins, for the week ending Nov. 1, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Nov. 1 1924	Oct. 25 1924	Nov. 1 1923
	Cts.	Cts.	Cts.
New York	20.0	20.0	25.0
Chicago	18.1	18.1	23.4
Boston	21.3	21.0	26.5
San Francisco	19.2	19.2	26.4
Wisconsin Boards	17.8	17.6	23.0

The receipts of cheese at these markets were 4,000,295 lbs. for the week as compared with 4,058,158 lbs. last week and 4,790,488 lbs. a year ago.

Butter Market

(Report by U. S. Dept. of Agr.)

Lighter supplies and better demand lent strength to butter markets during the week ending November 1. Production showed some decrease. Storage butter is still moving slowly. Exports continue on small scale.

The average wholesale prices on 92-score butter for the week ending Nov. 1, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Nov. 1 1924	Oct. 25 1924	Nov. 1 1923
	Cts.	Cts.	Cts.
New York	40.0	37.7	50.1
Chicago	38.0	36.7	50.0
Philadelphia	40.2	38.2	50.8
Boston	39.0	37.5	50.0
San Francisco	36.5	36.5	47.2

The receipts of butter at these markets were 9,882,877 lbs. for the week as compared with 10,202,378 lbs. for last week and 9,872,930 lbs. a year ago.

November Non-pool Prices

On Monday, October 27th, at a meeting of the New York Milk Conference Board and the Executive Committee of the Non-pooling Dairymen's Co-operative Association, Inc., held in New York City, the following schedule of prices was set for the month of November, 1924:

Class 1. All milk for city consumption $2.80 per 100 lbs. in the 201—210-mile zone, subject to published freight differentials and an addition of 4c per point of butterfat above 3%.

Class 2. All milk used for cream, plain condensed, and ice cream, $2.00 per 100 lbs. in the 201—210-mile zone, subject to freight differentials up and down of 1c per each 25 miles and an addition of 4c per point of butterfat above 3%.

Class 3A. All milk used for sterilized evaporated whole milk, sweetened condensed whole milk, whole milk powder, and milk chocolate in the 201—210-mile zone subject to freight differentials of 1c per each 50 miles and an addition of 4c per point of butterfat above 3%, price $1.60 per 100 lbs.

Class 4A. Prices for surplus milk made into butter shall be determined by the official New York City average outside quotation for 92-score butter.—Non-pooling Dairymen's Ass'n.

Wisconsin September Butter

(Wisconsin Department of Markets)

The following is an average report of the operations of 134 co-operative creameries in Wisconsin for the month of September, 1924:

No. of creameries	Price paid for fat	Ave. price rec'd for butter	Ave. overrun	Ave. fat rec'd
	Cts.	Cts.	%	Lbs.
1	45	40.5	24.0	10,756
2	44	38.5	24.7	45,074
16	43	37.2	24.6	27,627
25	42	36.6	24.0	43,004
33	41	34.7	23.3	28,326
27	40	36.2	22.1	28,850
14	39	35.8	22.9	20,542
7	38	35.8	21.3	12,619
4	37	34.7	23.3	10,623
3	36	35.0	21.7	9,947
1	35	35.5	20.4	5,220
1	27	26.0	21.5	5,265
134				20,652

Butter Prices for October

The following table is compiled from daily quotations by the U. S. Department of Agriculture and covers the average wholesale prices during October on 92-score butter (extras) at four of the principal markets, together with the receipts and storage holdings at these markets:

	Ave. price Oct. 1924	Oct. 1923	Receipts Oct. 1924	Oct. 1923
	Cts.	Cts.	Tubs	Tubs
Chicago	37.5	46.8	229,957	202,253
New York	38.7	47.6	275,581	230,291
Boston	38.4	47.7	73,395	75,581
Philadelphia	39.4	48.5	72,906	69,948
Total receipts for October			651,837	578,073
Total receipts since Jan. 1			8,144,292	7,434,615
Storage holdings			1,208,052	612,122

Ninety-score butter averaged 35 cents for October in Chicago, with centralized butter at this market selling for 34.8 cents. Jobbers' prices on extras sold to retailers averaged 39.8 cents in Chicago and 42.2 cents in New York.

League's November Milk Prices

The producers' November price for Class 1 milk for city distribution is $3.07 per 100 pounds (3 per cent butterfat) at the 201—210-mile freight zone. This is an increase of 1 cent per quart over the October price. The schedule of prices for November milk in the remaining classes follows: Class 2-A (milk for cream) $1.90, plus skimmilk value; Class 2-B (plain condensed and ice cream) $2.05; Class 2-C (soft cheeses) $2.05; Class 3-A (evaporated, sweetened condensed) $1.60; Class 3-B (milk powder and hard cheeses, other than American) $1.55; Class 4-A (butter) and Class 4-B (American cheese) determined by average wholesale price during November of butter and cheese respectively. —Dairymen's League.

October Milk Prices

(From Report by U. S. Dept. of Agriculture)

Table I represents a comparison of the net prices received by producers in 111 local markets, for fluid milk (test 3.5%) f. o. b. local shipping point or distributor's plant:

Table I—October Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparisons of average prices 1924 Sept.	1924 Sept.	1923 Oct.

*—First half. ‡—Second half.

b—Ave. 92-score Chicago butter plus 40c.

d—Ave. 92-score Chicago butter plus 30c.

c—10 times Longhorn cheese quotation plus ten cents.

FOND DU LAC, Wis., Nov. 7—Average cheese prices (majority of sales), f. o. b. shipping point: Twins, 18¼c; single Daisies, 19¼c; double Daisies, 19c; Longhorns, 19c; square prints, 21c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Nov. 8: Single Daisies, 18¼c. On Farmers' Call Board, Nov. 7: Single Daisies, 17¾c; Longhorns, 17¾c; square prints, 19¼c.

NEW YORK, Nov. 10—Butter—Steady; receipts, 4,348 tubs; fresh supply, 63,214 tubs; creamery extras, 40c; specials, 40½@41c.

Eggs—Quiet; receipts, 4,722 cases; fresh supply, 85,696 cases; white, fancy, 81@84c; fresh firsts, 44@59c; western whites, 37@80c.

MILWAUKEE, Nov. 10—Creamery, extra tubs, 38½c; standards, 37c; extra firsts, 35@36c; firsts, 31@32c; seconds, 30@32c.

Eggs—Fresh gathered, firsts (new cases), including cases, candled, 48@49c; miscellaneous lots, shippers' cases returned, candled, 44@46c; seconds, dirties, 29@30c; checks, 20@28c.

Cheese—American full cream, Twins, 18@18½c; Young Americans, 18½@19c; Longhorns, 19@19½c; Daisies, single, 19@19½c; squares, 19½@20c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

CHICAGO, Nov. 10—With a fair amount of trading reported, especially on the medium and lower scores, the butter market today ruled steady. Stocks of butter on the streets were not large, and dealers in some quarters found it possible to obtain slight premiums on full 89- and 90-score lots. The centralized car was steady, with trading quiet. Ninety-score centralized storage cars moving at a wide range of prices from 33½ to 35 cents. Fresh butter—92-score, 38½c; 91-score, 36c; 90-score, 34c; 89-score, 33c; 88-score, 30c; 86-score, 28c. Centralized carlots—90-score, 37c; 89-score, 33c; 88-score, 30½c.

Uncle Ab says the man who can do the most generally gets farthest.

Putting Up With the Dairy Cow

(Continued from page 538)

that he believed they could do as much work in five days as they had been doing in five and a half. At any rate he said they were to go home Friday evening and stay there till Monday morning. If the work didn't suffer they would be paid for five days' work and given a Saturday vacation without pay.

Evidently Henry Ford has no qualms of conscience about having his immense offices idle for one-sixth of the time, if that is the profitable thing to do.

We hear about factories being operated at a loss. Usually that means that the business is returning no dividends on capital. It is reasonably certain, however, that operating expenses are being met or the factory shuts down in short order or goes on part time production.

Praise be! The farmers still want to do an honest day's work for a fair return. Perhaps their example will influence some city laborers to do likewise. However, with a dozen jobs demanding attention at the same time, the dairy farmer can spend his time more profitably than sitting under boarder cows twice a day and cussing his luck once a month because the feed bill equals the milk check.

Friendly Talks For Farm Folks

Aunt Mary Martin makes a bang-up salad out of everything, she says, but the kitchen stove. Even Solomon Pease, the hired man, who is so everlastingly fussy about his eating, has to admit that Aunt Mary's salad is just about the kitten's cream, but even he can't get the mixer to tell what the ingredients are which makes it so awfully good. When hard pressed for her recipe, Aunt Mary protests, "Why, there ain't no receipe for that salad. Sometimes I put in a dash of cold ham with the vegetables left from yesterday's meals, and again I may use a few apples and a lick of this and a bit of that—but mark this—it always tastes good!"

⚜

Mrs. Durlan Butts happened out to the barn one day and there beheld her seven-year-old energetically scrubbing the old black cow's remaining teeth. When the youngster was pulled off the amazed milker and was asked what in the name of common sense was she doing, little Ruth yelled wrathfully, "Old Bos can't clean her teeth and everybu'dy should clean their teeth and Teacher says so and so I was fixing Old Bos' teeth so they wouldn't decay." Who says the proper health gymnastics aren't taught in the little red school house?

⚜

After all this autumn's political mud-slinging has ceased, may we expect the national flower of contentment to bloom thriftily therefrom for the next four years?

⚜

Elizur Fuller says he has heard somewhere that Opportunity never knocks but once, which is some different policy from that shown by unlucky folks who are forever knocking Opportunity.

⚜

If the predicted styles are going to advocate ears again on a woman's head, we know a few hundred of our sex who are going to have 'em bobbed, come what may. Pretty ears are simply born, not beauty-parlor made.

⚜

Ten green apples a day will keep the doctor away just an hour too long from the standpoint of the unfortunate kid who has ate 'em.

⚜

It's certainly true that one-half of the world doesn't know how the other half lives, as here in Brown's Corners one-half of the farmers who work hard for a living and daily scrimp and save, just can't understand how the other half of their neighbors who don't, can make a bare living these days and stick it out a while longer.

⚜

Al Whitney has a new roll-top desk which he says is the best one he ever owned. It's exactly right in height, says Al, for his feet to rest on without getting tired.

⚜

Annie Jewett has bobbed her hair and Bob Jewett is cultivating a beard. What in the world will there be left for little Nancy and Junior Jewett to do when they grow up, in order to assert their personalities?

⚜

In spite of the publicity in which Babe Ruth is surrounded year after year, we hope that no parents have become so over-enthusiastic as to name their latest male baby "Ruth".

⚜

Ma Morton refuses to buy a new kitchen cabinet until they contain a complete radio set with ear doo-dings which you can wear to interesting purpose while making pies and beating up biscuits.

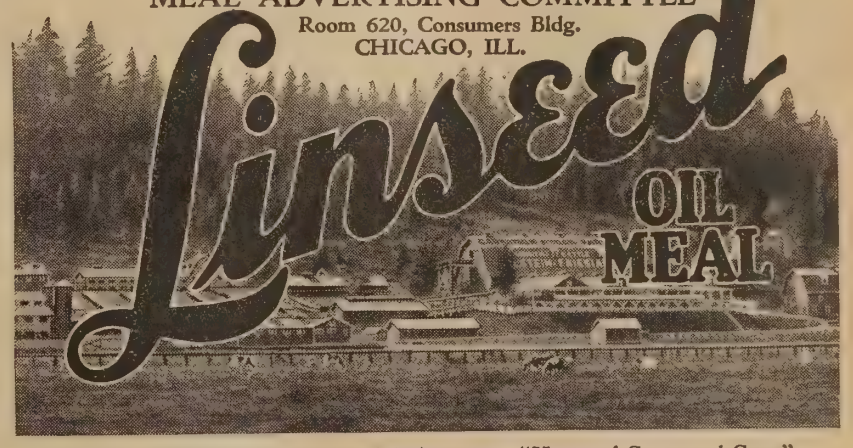
Dec. 9—Holsteins. Dispersal of J. M. Kelley herd at Baraboo, Wis. Frances Darcey, Sales Manager.

Segis Pieterje Prospect
Produced 37,381 pounds of milk in one year, 72,931 pounds in two years

World's Record Milk Producer



THE outstanding feature at the recent National Dairy Show at Milwaukee, Wis., was the world's greatest milk producer, Segis Pieterje Prospect. Visitors of all occupations and ages, crowded around her stall and read with admiration and wonder of her wonderful record. Her picture was in the daily papers, and was displayed in all the prominent stores of that city. Prospect is owned by

Carnation Milk Farms — Located Near Seattle, Wash.

Linseed Oil Meal constitutes one-fourth of Prospect's grain ration before freshening and one-fifth after freshening. Mr. Carl Gockerell, Herdsman of the Carnation Farms, gives due credit to this great proteid and laxative by stating that without Linseed Oil Meal his maintenance and production grain rations are totally upset. He would not be without it.

Record-breakers the country over, not alone in the dairy breed, but among animals of all kinds, have their rations balanced with Linseed Oil Meal. It pays—as explained fully in our booklet, "How to Make Money with Linseed Oil Meal," written by Prof. F. B. Morrison, Asst. Director of the Wisconsin Experiment Station. Send for your copy now. Ask for Booklet T-11.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Danny Applies Business Methods to Club Work

Foreword: In this installment of the "Adventures of Daniel Dare" we find our young hero and his father absorbing a few principles of farm management as explained by an expert along these lines. Later Danny applies business methods to his club work by working on his record book. You will notice that Mr. Dare, Jimmie Watkins, and Jimmie's father all get a few new ideas. It's record book time for club members. Have you completed yours yet? This chapter will be concluded in an early issue of Hoard's Dairyman.

"Farming is a business," the speaker was saying, "and we can't expect to get very far if we don't treat it in a businesslike way."

Danny and his father were attending an evening meeting in the schoolhouse, called by the county agent. Mr. Donald, a farm management expert from the College of Agriculture was the speaker. The schoolroom was crowded with farmers and farm boys. Both Danny and his father appeared very much interested in the words of the speaker.

"There are certain methods that good business men use. You farmers aren't farming just for your health. You farm to earn your daily bread and butter. You can use the business men's methods just as well as they can. For instance, let me illustrate what I mean.

"A friend of mine is in the hardware business. I don't hesitate to say he is making a comfortable living. If I were to ask him what his net income was last year, he could tell me exactly. He could also tell me pretty correctly the value of the stock in his stores. If I were to ask that question of you men tonight, I'm afraid not very many could give me even an approximate figure offhand.

"How does my hardware friend know where he stands? Because he keeps books for one thing. There are other aids to his business. His store is known as The Ajax Hardware Company. He would no more think of doing business without a name than he would think of cutting off his right hand. He might call his firm the John Smith Hardware Company but perhaps some day he'll want to sell his business to some one whose name isn't John Smith. It means dollars and cents added to the selling value of his property because the name and all the good will that goes with it can be sold. How many of you farmers have names like that for *your farm?*

"My hardware friend has a typewriter with which he writes his business letters on stationery having an attractive letter head. He makes a carbon copy of his letters. They might come in handy in case of an argument later on. How about you? He has a checking account at the bank. His checks advertise his firm because he has the firm name on them. They also serve as receipts and are a great help in his bookkeeping. Do you do your business by a checking account? Another thing, my friend has a letter file where he files the letters he receives and the answers to them. Not a half bad idea. And for a quarter *you* can purchase a letter file which will last for quite a while.

"Bookkeeping—you hate the sound of the word. All right, let's call it record making. My hardware friend knows where he's at because he keeps books. Why won't it work for you? You believe in records, I know, because most of you are members of the cow testing association. By checking up on your cows, you eliminate the boarders and encourage the profitable producers. Just the other day I read in Hoard's Dairyman of a business man who moved to a dairy farm some years ago. One of the first things he did was to keep barn records on his cows. That was before the time of the cow testing association. When an association was organized in his community, he was one of the first to join and its best pusher. He knew the value of records. The result was that he has been making money the past few years when some of the others who haven't seen the light, are going heavier and heavier into debt each year.

"These are but a few suggestions which I hope you will make use of. We come now to this all important matter of farm accounts. Really it is not a difficult matter at all. Five or ten minutes a day is about all the time it requires on the average. A farm account may be simply divided into three sections—inventory (the placing of a valuation upon all your farm property), expenses, and money taken in. You don't need an expensive book to keep these accounts in. A ten-cent notebook would do all right. But here is a simple book which is so arranged as to make your record keeping easy. Certain pages are devoted to each farm problem—crops, horses, cattle, dairy products, hogs, sheep, poultry, labor, machinery, permanent improvements, and so on."

The speaker had a lot more to say about the farm record book. Mr. Dare was listening intently. Danny appeared interested. He leaned forward when Mr. Donald said:

"How many of you boys belong to a 4-H club of any kind?" Danny raised his hand. So did a number of other boys. "Great," Mr. Donald continued. "You're learning early the value of keeping records. You each have record books, don't you, where you keep track of all expenses and income from your club work? When you finish the year's work—and I expect that it's just about this time—you figure up the totals and discover whether you have made a profit or suffered a loss. Then you write a story of your season's experiences. . . ."

The next day was Friday, and Danny made it a point to see Jimmie Watkins.

"Jimmie, what do you say? Don't you want to come over tonight and we'll work on our record books. Maybe you can help me."

"Sure—good idea! I'll be over about half past seven."

The appointed hour arrived, and so did Jimmie. Around the table gathered a group of three, Danny and Jimmie with their record books, pen and ink, and Mr. Dare with pencil and paper and a new book.

"Dad, did you buy a farm record book last night?"

"Yes, I did, Danny. I've kept accounts after a fashion for some time, but I thought a little better system wouldn't hurt. The inventory idea is something I never used before, but I think it will be interesting. I'm going to make an inventory tonight. Mr. Donald said the first of January was the best time to start, but I think there's no time like the present!"

"Jimmie, didn't you like that man's talk last night?" Danny asked.

"You bet I did, Danny. My dad's had a typewriter for quite a while, but I noticed he bought a letter file today! And do you know what! We've just got a name for our farm today, too, and father had it registered with the register of deeds. That protects us from having anybody else in the county register the same name and it only cost a quarter. What do you think the name is, Danny?"

"Couldn't guess!"

"Twin Pines Dairy! You remember those two big pine trees on our lawn, don't you?"

"Sure enough, Jimmie, that's a good name!" Mr. Dare broke in.

"C'mon, let's get to work on our books," Danny insisted.

[To be continued]

DANNY AND JIMMIE AT WORK ON THEIR RECORD BOOKS

Here you see Danny getting a few tips from Jimmie. See the Hoard's Dairyman Juniors' button in Jimmie's coat.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Some day that little awkward heifer calf that you see toddling around in the barn will be a cow. It is well not to forget that even world's champion cows, yes and bulls, too, were once just as awkward as that youngster now is. It is important that the calf get the right kind of a start in life.

How do you feed your calf? How does your father feed his calves? What is the best way to feed calves? In answer to this question let us dis-

EDITH CLARKE, WISCONSIN, WON FIRST AT THE NATIONAL DAIRY SHOW ON THIS 2-YEAR-OLD HOLSTEIN HEIFER

FOY MENDENHALL UPHELD INDIANA CLUB HONORS AT THE NATIONAL BY WINNING FIRST ON THIS JERSEY IN MILK

CLARENCE KEPPEN, ANOTHER BADGER STATE CLUB MEMBER, WAS DECLARED THE BEST HOLSTEIN JUNIOR SHOWMAN AT THE NATIONAL

cuss that splendid article in the November 7th issue of Hoard's Dairyman entitled "Feeding the Dairy Calf" written by Charles W. Turner of Missouri.

Which is better, to have calves born in the spring or in the fall? Fall calves are ready to go on pasture the following spring. They need no attention as long as the pasture is good. Spring calves cannot be placed on pasture the first year.

How should the new born calf be fed? The first milk or colostrum has been shown to be vitally needed by the new born calf. It is interesting to note that the white of an egg has been found to be a very satisfactory substitute for colostrum.

How can you teach a calf to drink out of a bucket? By letting the calf suck your finger and putting the calf's head in the pail. The finger is then removed and the calf will start to drink the milk.

How much milk and how often should it be fed? From two to five pounds of whole milk fed three times a day until the calf is three or four weeks of age.

Discuss feeding grain and hay to calves. When the calves are two or three weeks old they will begin to eat small amounts of choice hay and grain. The latter should be fed dry and not mixed with the milk. The best time to feed grain is just after milk has been fed. The hay can be fed later.

When should a calf be fed skimmilk? As soon as the calf is able to eat hay, which contains vitamines, gradually replace the whole milk with skimmilk at the rate of one pound a day. The whole change can be completed by the time the calf is about four weeks of age. Because skimmilk lacks the fat found in whole milk, this should be supplied in grain feed.

How about feeding silage? It has been found that feeding silage before a calf is two or three months of age is not entirely desirable. Later silage is relished and forms a good feed for calves.

Which is better, to feed whole or ground grain? Whole grain is apt to be more thoroughly digested by the young calf up to the age of about six months. Calves seem to like whole grain better than ground grain.

Give a good grain mixture for calves. There are several good grain mixtures. The Iowa Station recommends the following mixtures: Corn, 5 parts; oats or bran, 3 parts; oil meal, 3 parts; also oats, 3 parts; bran, 1 part and oil meal, 1 part. A popular grain mixture consists of 3 parts corn meal, 3 parts ground oats, 1 part wheat bran, 1 part linseed meal.

Junior Letters

This Junior Knows Birds

Hoard's Dairyman Juniors:—I live on the next to the highest point of the Ozarks. If you know where the Ozarks are, you will know where I live. I live on a 280-acre farm. We have 16 head of pure-bred Holsteins and one grade cow. Daddy gave me a little calf when she was 4 days old. She is a pure-bred Holstein calf. We have 3 horses and 3 mules. One of them is two years old.

I know a lot of birds. They are the hawk, crow, buzzard, sparrow, jay, martin, robin, quail, woodpecker, yellow hammer, ground robin, mockingbird, phoebe, and butcher bird. The quails are very common around here in winter when the snow is on the ground. They are in big bunches and get under bushes. When it comes time for them to build, they pile a lot of sticks in a pile and make a nest out of them and the mother bird sometimes lays 20 eggs. I have seen them with 18 eggs. The mother bird will run a little ways off before she will fly so you cannot find their nest. The little birds will run away before they are 3 days old. I have scared up lots of bunches that have 25 little ones in it. Their eggs are shaped like a hen's egg and are white.

I received my badge, button, and creed. The badge came in handy for a watch chain, for I sold some snap fasteners and got a watch. If any of the juniors want to write to me, my address is R. 3, Box 13, Mansfield, Missouri.

Harold Haswell, Jr.

First Impressions of Club Work

Hoard's Dairyman Juniors:—I got my first impression of being a club member at our town hall in the first part of May in the year 1923. Mr. Howard, one of the state club leaders, was there at this occasion and induced me to join the Almsted County Boys' and Girls' Dairy Calf Club. About two weeks later Mr. Ausen, our county club leader, my father, and I went to the Mayowood Farm and here my father purchased my Holstein calf for $125.

I received my calf June 7th and I immediately began feeding and taking care of her. I therefore have had my calf under my care for about six months.

I have been feeding her about four pounds of ground oats and about eight pounds of clover and timothy hay per day, and I generally tie her out on grass for about two hours every night after I get home from school.

I am thirteen years old.

The name of the club to which I belong is the Olmsted County Boys' and Girls' Dairy Calf Club.

My calf won me a free trip to the State Fair and the International Live Stock Show and Second Annual Club Congress in Chicago. My calf gained 165 lbs. in 74 days at a feed cost of $10.92. My address is Rochester, Minn.

Carlton, Penz.

Earns College Money With Dairy

Hoard's Dairyman Juniors:—I live on a 115-acre farm about 3½ miles east of Franklin in the Rabbit Creek section but on the branch of it called Cat Creek. When any of you chance to come to Franklin call around to see me. I'll be glad to have you.

I am a Junior in high school. I walk from home to Franklin to school but I like it. Father and mother say it has done me good. My 15-year-old brother walks with me. My 5-year-old brother means to start a year from now. There is a school about a mile from here but it does not take us as far as I am so we do not attend it.

One of my classmates and I made the highest averages in high school. Her average was 95⅞ and mine 95⅝. We studied together.

I just love to milk so father says he'll let me run the dairy business for four or five summers to earn my college money and I am glad. It feels so much better when one doesn't have to depend on one's parents for everything.

This year we raised corn, soy beans, and mung beans and grass and clover. We are going to try soy and mung bean hay for the cows instead of so much boughten feed. Father sowed some sweet clover, just to try it.

If any of you were born September 26, 1908, I'll be glad to hear from you or anyone else. My address is Mary Lois Ferguson, R. 4, Franklin, N. C.

Liming for Alfalfa

Hoard's Dairyman Juniors:—We live on an eighty-acre farm. We have 4 horses, 13 cows, and 1 heifer, We also have a pure-bred sire and 5 yearlings. The sire's name is Prince Sterling Nesbit. I like Holsteins best. I milk 4 to 5 cows every night and morning. I help my mother in the house, also, and help with more than one thing in the barn.

We belong to the Almena Cow Testing Association. We live about 11 miles from the largest co-operative creamery in the world, which is called Barron or "The Butter City". Barron County is free from T. B. They are going to organize a calf club in Barron County, which I surely want to be a member of. In December, 1923, my father ordered five tons of lime and several others in Almena Cow Testing Association ordered lime, which amounted to two carloads. It came to our closest town, which is four miles and a quarter form our home. It was at our town Saturday, March 8th. The roads were bad, as we did not have much snow last winter. On the way to get the lime, my father's sleigh pole broke and he had to get a new pole. So you can see what fun he had getting five tons of lime. We expected to lime a piece of soil and plant alfalfa on it.

I wish some of the juniors would write to me. My address is R. 2, Clayton, Wis.

Gertrude Hamlow.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

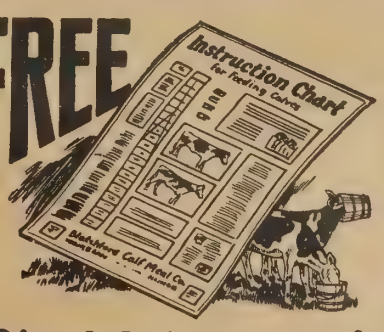
ATWATER KENT

RADIO

Don't Miss Again What You Missed Last Winter

WITH ATWATER KENT Radio you, too, will want to turn back the hands of your clock. With better broadcasting than ever before, you will find that evenings that once were long are now all too short.

ATWATER KENT Radio is the modern "magic wishing-ring." By a simple turn of the dials, you can summon to your fireside, concerts, operas, lectures, sermons, educational courses; market, weather and special reports. ATWATER KENT Radio makes you master of the world's wealth of music, news and knowledge.



ATWATER KENT craftsmen, guided by the experience of skilled engineers, have fashioned the finest materials that money can buy into ATWATER KENT Radio. You will find it combines every feature that means radio satisfaction—unusual selectivity, sensitiveness, distance, volume and tonal quality. Any ATWATER KENT dealer will gladly help in the selection of your receiving set and loud speaker. Instructive Literature on request.

Build

"The Silo Without a Fault"

That's the way a prominent Wisconsin farmer describes his

Natco Hollow Tile Silo

The title fits. First cost is surprisingly low. And the cost of upkeep is exactly nothing. A Natco Silo is a Permanent structure. It will never rot, burst or blow down.

Moreover a Natco Hollow Tile Silo is Efficient. Within the walls is a blanket of dead air which effectively insulates the silage against heat, cold and moisture.

Wherever you are located a Natco Silo is easy to get—and sold on terms that make it easy to pay for.

Free Farm Building Book

Write for it. Plan for Durability. The strength and economy of Natco Hollow Tile are paying real dividends on many modern farms.

Wanted—A man to work in creamery. Must understand using the Babcock Test, pasteurizing and standardizing milk and cream. Give age, wages wanted and send references. Address BOX 347, Care Hoard's Dairyman.

Mail Service Employees Needed. For instructions write FRANK PERGANDE, 35-937, Bartlett, Milwaukee, Wisconsin. 16-*

Wanted—Good reliable single man good milker for dairy farm. Steady with good habits. CRYSTAL SPRING STOCK FARM, Littlestown, Pa. 18-2

Wanted—Experienced man to take care of our test cows. Must be a first class fitter and feeder for high records. One successful in the past and capable of producing results now. Must be of good address, sober and willing to work in co-operation with herdsman. Copy of references and full particulars in first letter. Place near Pittsburgh. Guernsey herd. BEECHWOOD FARMS, Sharpsburg, Pa. 18-2

Wanted—Experienced working dairyman on share basis—50-50—or salary, on 600 acre farm, raising corn, hay, and grain. Now milking 20 cows. Would like to increase dairy business and want man capable of handling dairy cattle and who knows how to produce grade A milk. We have year round pastures. Seldom need to shelter cows at night. Whole milk sells for four dollars. Four land owners here want similar kind of men. Write me. HUGH F. Mc ELDERRY, Talladega, Alabama.

Wanted—Reliable dairyman with capital to furnish cows, 100 gallons milk per day. 105 acres equipped. West Virginia, steady market, good future, permanent. State fully in first letter what you can do and when. Living conditions ideal. BLUEFIELD DAIRY CO., Bluefield, West Virginia.

Wanted—Married man for all around farm work at once. Have tenant house. State experience and wages first letter. FRED GLADE, Stillwater, Minn.

Wanted—First class man, general farm and dairy work. Steady employment. Good home and working conditions. Wages $55.00, board, washing with advance if worthy. References. VERNWOOD FARM, R. 2, Mukwonago, Wisconsin.

Massachusetts Guernsey Record

William R. West, of Massachusetts has a pure-bred Guernsey cow, Fine Feathers of High Hill, that has been on Advanced Register test for four consecutive years, resulting in records that prove her profit to her owner. She has just completed a record of 15,750.3 lbs. milk, 812.13 lbs. fat during the past year, and she was only six years old at the time she started her test. In addition to this record, the official production for the three years previous reads like this: At 2½ years: 10,297.9 lbs. milk, 511.38 lbs. fat; at 4 years: 12,863.2 lbs. milk, 643.57 lbs. fat; at 5 years: 15,505.6 lbs. milk, 767.24 lbs. fat.

She has therefore produced during four consecutive years, 54,417 lbs. milk (about 6,556 gallons), and 2,734.32 lbs. fat. It is estimated that if the milk this cow produced were all placed in pint bottles, and the bottles placed side by side, they would make a row two and one-half miles long of Golden Guernsey milk testing five per cent. Again if her milk were placed in quart bottles, and the bottles placed one on top of the other, they would make a tower 27½ times as high as the Woolworth Building.—The American Guernsey Cattle Club.

BROWN SWISS

SWISS VALLEY GIRL 7TH NO. 4678

Breed Brown Swiss Cattle

They prove their superiority over other breeds when subjected to trying conditions on the farm, by keeping in good flesh and filling the pail while other cows grow thin and reduce their yield. You can prove this to your satisfaction.

Dairy Herdman's Short Course at K. S. A. C.

The Kansas State Agricultural College offers a two weeks' course of intensive training in the feeding and management of dairy cattle, beginning December 1,

The course consists of lectures and laboratory studies on care, feeding, and management of dairy cattle, judging and showing, history of dairy breeds and pedigree analysis, sanitation, milk testing, cheese and farm buttermaking, and the production of crops on the dairy farm. This course will be just as practical in nature as possible to make it and is especially recommended for men who handle pure-bred cattle, or wish to become cow testers. Anyone with the equivalent of an eighth grade education is eligible. Tuition is free and as no text books are required the only cost will be that incidental to living in Manhattan for two weeks. For further information address the Dairy Department, K. S. A. C., Manhattan, Kansas.

Dairy Courses Offered at Ames

The second term of the six months' Course at Ames, Ia., begins January 5, 1925, and closes March 20. A student desiring to enter the Six Months' Course must be at least seventeen years of age, and must have satisfactorily completed the eighth grade of the public schools or its equivalent.

Students may enter the Six Months' Course in either fall or winter quarter. Men of considerable practical experience may not care to take more than three months' work. For such students we recommend the winter quarter.

The Ten-day Short Course for experienced buttermakers, ice cream makers, and creamery managers is given from February 11 to February 21. Further announcement in reference to this course will be made later.

For further information address the Dairy Department, Iowa State College, Ames, Iowa.

Beware of Cattle Swindler

Beware of a man who works the following scheme. He comes to you claiming to have bought part of a load of grades (Holsteins) in some territory near you. You drive him to finish his load. He buys freely, but pays nothing down. At night, or just before banks close, he exhibits a telegram from an out-of-state bank stating that he has funds on deposit. He writes a check for enough to finish paying for his purchases in the territory where he bought the part load, saying he will go to pay for them and then comes back to finish with you. He presents this check at your bank. He asks you to sign on his check as endorser. Don't do it!

A man claiming to be H. C. Helms of Nashville, Tennessee, worked this swindle on one of our Holstein county sales managers, making away with $650. Telegrams to the Nashville bank brought forth information that no such man had ever had any deposits to his credit in such bank, as he claimed, but that a man of such name was wanted by the Nashville police.

If you meet this man, or obtain any information regarding him, wire me at once.—J. G. HAYS, Dairy Dept., Michigan Agricultural College, East Lansing, Mich.

Aunt Ada's Axioms: They say modern boys and girls use home mainly as a place to get ready to go somewhere else but they eat there most of the time; table talk gives the best chance to set high standards.

POULTRY On The DAIRY FARM

Feed the Poultry Milk

The value of milk as a poultry feed has been brought out in the last few years. This should prove of interest to the dairy farmer, since he usually has plenty of skimmilk each day. When a small portion of this is saved for the poultry, an increase in egg production will be realized, providing the hens are fed a good assortment of whole grains and some mash. The Missouri Agricultural Experiment Station Bulletin No. 197 cites a very interesting experiment with regard to the value of milk as a poultry feed. When sour milk was given as a source of protein, the average egg production increased from 113 eggs per year in a tankage ration, to 128 eggs per year in the sour milk ration. The addition of sour milk also reduced the amount of feed necessary to produce a dozen eggs from 9 lbs. to 7.2 lbs., not including the milk which contains a very small amount of dry matter. The mash which was fed consisted of equal parts by weight of bran, shorts, and corn meal, to which was added all of the sour milk which the birds would drink each day. The sour milk was fed in open pans and the mash fed in the hopper. One hundred birds will consume from three to four gallons of milk per day. It is very important that the birds be given no water, because enough water is taken into the system through the sour milk. This illustrates the value which may be attached to skimmilk and teaches us that many poultrymen, particularly the farmers, with their flocks of poultry, are not making use of a very cheap source of feed.

Milk may be fed in three forms, namely buttermilk, skimmilk which may be divided into sour and sweet skimmilk. Buttermilk has a higher feed value than skimmilk but is higher in price and the supply is not as great. It is skimmilk which offers to the dairy farmer an important means of increasing his season's egg production and of making that increase at a very slightly greater cost. Leghorn pullets consume an average of about 93 lbs. of skimmilk a year. When all of the milk the layers will drink is added to a ration consisting entirely of grains, it is worth about 25c per hundred when meat scrap is worth $2.50 per hundred. The addition of skimmilk to a ration increases the consumption of other feed and in this manner serves to stimulate greater egg production.

Skimmilk may be fed either sweet or sour but is to be preferred sour. Sour milk has the most favorable influence on growth and vigor and is an important agent in the reduction of mortality from all causes. In one instance two 100-bird lots of February hatched White Leghorn pullets were both fed a standard ration but one pen had access to sour skimmilk at all times while the other did not; the sour milk lot laid 3,661 eggs more in a year than did the no-milk lot, or 36 eggs more each. It is usually figured that 100 lbs. of skimmilk takes the place of 5.4 lbs. of meat scrap in the ration.

Many farmers are not availing themselves of this splendid opportunity which the feed of skimmilk offers. Practically every farmer has a chance to secure skimmilk. This skimmilk may be turned into money perhaps better through poultry than any other form of live stock. The advantages gained through the feeding of skimmilk may be summed up as follows: More eggs per hen per year; less feed required to produce a dozen eggs; a healthier flock; and a cheaper source of protein than meat scrap or tankage.

The following ration illustrates the proper way of using skimmilk: Grain mixture—2 parts by weight of corn and one part of oats. Mash mixture—100 lbs. ground corn, 100 lbs. ground oats, 100 lbs. wheat bran, 100 lbs. wheat middlings. All of the sour skimmilk the poultry will drink—no water given.

The reason for feeding skimmilk lies in the fact that the skimmilk increases the palatability of the other feeds and also supplies the protein part of the ration. Let us utilize skimmilk to its greatest advantage on the dairy farm.—O. A. HANKE.

A Few Seasonals

The first complaint about colds in the pullet flock has been received. Trying to take the full advantage of a rare fall may lead more into the same trouble.

Rather than allow the pullets to remain roosting in trees until after the first cold rains and cold nights, one should have them properly housed at this time. A more rapid development will result by housing and proper feeding.

Another cause of colds is due to crowding. A mighty fine flock of Reds was seen just recently that were all huddled on the floor because roosts were not available.

It is a hard problem to teach pullets to roost after they have become accustomed to crowding on the floor. The crowding which results causes heating and the birds become chilled when turned out in the morning. There is not a more ideal manner in which to get colds started.

If a temporary partition can be placed in the house to separate the pullets and hens until a little later in the season, better results will be obtained. Most of the pullets are cowed by the hens and do not have a fair break in getting their share of feed. Feeding methods should be different with the two classes for at least a part of the late fall. With a little more development and confidence the pullets will overcome this disadvantage and feeding practices are more comparable after production has been well started. J. B. HAYES.

Hen Makes Another World's Record

On September 11 a White Leghorn No. B-207, known as Lady Purdue, broke the world's record for long distance laying. On that day her egg record totaled 1,341 eggs which is more eggs than any hen was ever known to have laid in a trap nest throughout the entire world. This hen was hatched in April of 1916 and during her first year laid 217 eggs, second year 182 eggs, third year 150 eggs, fourth year 204 eggs, fifth year 187 eggs, sixth year 140 eggs, seventh year 163 eggs, and this year 98 eggs to September 11. The mother of Lady Purdue laid 183 eggs and came from unknown ancestry. The sire of this hen was hatched from a 252-egg hen and was sired by a famous male known as John Purdue. This male has been the ancestor of most of the high laying Leghorns now on the Purdue Farm. Lady Purdue has produced but four infertile eggs during all of her hatching seasons and these have all been produced in the last two years. Some 70 chicks have been hatched from her eggs. There have been quite a number of daughters raised from these chicks and many of them have laid well over 200 eggs.

Purdue has been giving a good deal of study to the question of longevity in egg production, trying to develop a strain of Leghorns that will not only lay well one year but will continue this production through many years. This is an economical proposition since if found practical, will reduce the number of chicks necessary to be hatched and reared each year. Every year the Poultry Department produces records of 1000 eggs from two or three hens and this year has been no exception, three new hens coming into the 1000-egg group.

Thirteen hundred and forty-one eggs weighing two ounces each would mean a production of 167⅝ pounds which is practically 42 times the bird's body weight.—Purdue Experiment Station.

A tobacco that never changes, deposes Mr. Bruce

And you'll say he ought to be a judge

Mr. Bruce doesn't know of the eternal vigilance that its makers exercise to keep "good old Edgeworth" unchanged in quality. But it is our conviction that a man buys the next tin of Edgeworth because he liked the one before it.

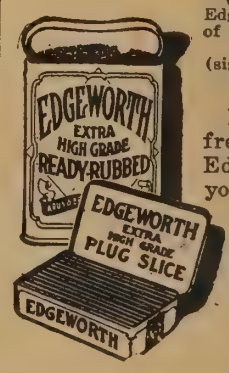
Therefore, it is up to us to see that he gets what he is trying to buy—"more of the same." We are glad to know that Edgeworth smokers realize the uniformity that we rather painstakingly maintain for them.

And Mr. Bruce is well qualified to testify on this point. He tells us that he averages better than half a tin a day, and he has been smoking Edgeworth for eight years.

Let's see—that's something like 1461 tins for Mr. Bruce, according to our office calculator. But Mr. Bruce's own letter will be more interesting than our comments. Here it is:

Savannah, Ga.
March 14, 1924.

Messrs. Larus and Bro. Co.
Richmond, Va.



Gentlemen:

I have been using Edgeworth since 1916 and think it is the best pipe tobacco on the market. The flavor and aroma are distinctive; the quality, being the very best, never changes; and as I have smoked nearly every brand of pipe tobacco made, I have never found its equal.

My pipe is in my mouth nearly every hour of the day, and I smoke continually, using a can in less than two days, but have never felt any bad effects from Edgeworth.

I have the best smoking combination there is—a can of Edgeworth and a B B B curve stem—and these two friends, having been with me for eight years, are going to be with me as long as I live.

Wishing you and Edgeworth the best of success, I remain,
Yours very truly,
(signed) F. K. Bruce,
705 East 39th St.

Let us send you free samples of Edgeworth so that you may put it to the pipe test. If you like the samples, you'll like Edgeworth wherever and whenever you buy it, for it never changes in quality.

Write your name and address to Larus & Brother Company, 57 South 21st Street, Richmond, Va.

Edgeworth is sold in various sizes to suit the needs and means of all purchasers. Both Edgeworth Plug Slice and Ready-Rubbed are packed in small, pocket-size packages, in handsome humidors holding a pound, and also in several handy in-between sizes.

We'll be grateful for the name and address of your tobacco dealer, too, if you care to add them.

To Retail Tobacco Merchants: If your jobber cannot supply you with Edgeworth, Larus & Brother Company will gladly send you prepaid by parcel post a one- or two-dozen carton of any size of Edgeworth Plug Slice or Ready-Rubbed for the same price you would pay the jobber.

BULL BROS.

HOLSTEIN SALE!

Tuesday, Nov. 18

TERMS CASH

Owing to loss of barn by fire we must sell

70 Registered Females 70

Offering will include 50 heifers up to four years, all daughters of K. P. B. A. Fedora King, a proven grandson of King of the Pontiacs from Novelty Fedora Hengerveld, 1022 lbs. butter, 22,000 lbs. milk, 4 years; 800 lbs. at 2 years.

K. P. B. A. has daughters with 900 lbs. as 2-year-olds to 1100 lbs. at maturity.

These heifers have been raised on hay entirely; no ensilage has been fed on farm for past seven years, and they have passed their lives outdoors.

Herd is free from tuberculosis and is absolutely free from abortion, as the number of female offspring will prove—nearly 100 head sired by K. P. B. A. from an original herd of thirty-five head in five years.

Sale held at 10 o'clock, on farm 3 miles west on Yellowstone Trail, **ABERDEEN, S. D.**

Foundation Females For Sale

We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

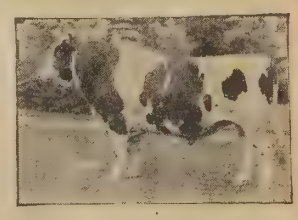
A SHOW BULL

Traverse Echo Sylvia Kaastra No. 343285

Senior sire in the Michigan Reformatory herd. First prize aged bull and grand champion at the West Michigan State Fair in 1924.

Sire: Echo Sylvia King Model, a 36-lb. grandson of May Echo Sylvia. His 42 A. R. O. daughters include a 32.33-lb. Jr. 3-yr.-old.
Dam: A 25-lb. Sr. 3-yr.-old daughter of a 31-lb. cow with a 365-day record of 989.68 lbs. butter and 23,629 lbs. milk.
The Reformatory Herd of 140 head includes 54 A. R. O. cows, 12 from 25 to 31 lbs. butter in 7 days and 8 yearly record cows, one above 1000 lbs.



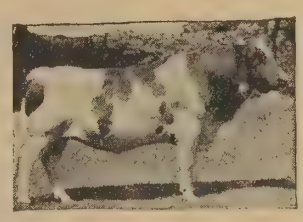
Bull calves by Traverse Echo Sylvia Kaastra from good A. R. O. cows. Send for our list of bulls for sale by Michigan State Herds.

BUREAU OF ANIMAL INDUSTRY, Dept. B, LANSING, MICH.

Detroit Creamery Co. Holsteins

Sir Hengerveld Pietertje Ormsby, Sr. Sire

A grand champion bull whose daughters prove him one of the really good present day sires. He is a double grandson of S. P. O. M. His dam, Chloe Pietertje Ormsby, has 4 yearly records that average 1,048 lbs. butter. We can now offer a few bull calves by him and from 7-day and year record dams.



We Are Offering For Sale

a 6-months-old bull whose dam, a 29-lb. 2-year-old, is now on year test as a 4-year-old with 514 lbs. butter in 4½ months. She is a granddaughter of May Echo Sylvia. His sire is a son of Jemima Johanna Segis, 1,175 lbs. butter as a 4-year-old.

High Testing Show Bulls

—ALL AGES—

Get the most popular breeding. They are bred for great butter production and for show type. They are the highest testing family of the breed. In no other herd can you get all these features in one animal. Tell us what you want.

HARGROVE & ARNOLD Norwalk, Iowa

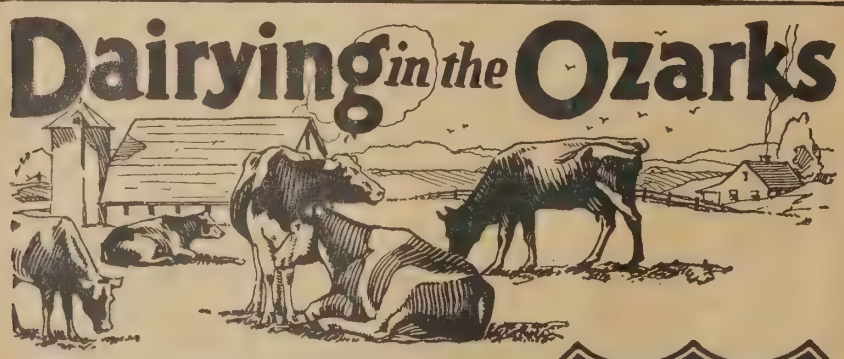
Imp. Togo's Ginger. A non-producer at 12 yrs. of age. Murphy's Minerals were added to her ration and she produced 561 lbs. butter fat the next year.

"She was headed for the block as a non-producer"

Don't send that cow to the block! Murphy's Minerals saved thousands of cows last year from being sold as cheap canners.

Minerals are what their systems crave. They are mineral starved from high pressure concentrates and low mineral roughages. They have robbed their own systems to supply the minerals for their calves and milk until nature refuses to do more and a breakdown follows.

Murphy's Mineral Feed acts directly to increase *production*, prevent *goitre* and *depraved appetite*, and reduce *abortion* and *sterility*. It supplies to the animal the proper minerals in a concentrated, highly digestible, perfectly balanced form.



Written Binding Guarantee

Murphy's contains *no* indigestible ingredients—*no* agricultural limestone, *no* rock phosphate, *no* filler, *no* drugs, *no* medicine. It is palatable. With it even healthy herds increase their milk yield sufficient to pay several times its cost.

Murphy's is the only mineral feed sold on a *written, absolute, binding guarantee* of satisfaction or your money refunded. Write for book showing the true value of mineral feeds and how to judge them. It is Free. Simply address: MURPHY PRODUCTS CO., 111 8th St., Delavan, Wis.

MURPHY'S MINERALS

Dairying in the Ozarks

THE Ozark Dairyman prospering with the rapidly growing butter fat production of the Ozarks, has everything his way today. Land, ideally located, is still reasonably priced. Blue grass flourishes, and the grazing season is ten months long. Gentle hills give natural shelter from winter winds—and these winds are further tempered by an average winter temperature of 41.6 degrees. The Ozark summers are as ideal for dairying as the winters—with an average temperature of 78.9 degrees. To top such favorable climatic and grazing conditions, is the advantage of Ozark water—clear, cold, pure—gushing in springs from the hillsides, running in sparkling streams and rivers throughout the Ozark territory.

FRISCO LINES

These conditions are behind the rapid growth of the dairy industry in the Ozarks. They make it possible for a man to start with much less capital, with smaller outlay for animal shelter than would be necessary in the north, and with every opportunity for success. All the forces of nature are in his favor—and efficient railway service provides the outlet for his products.

Hard roads, good schools, progressive, growing communities and the healthful climate make the Ozarks a most desirable homeland. In such surroundings the Ozark Dairyman is a big factor in a growing state. Write me!

AMERICAN SHEET AND TIN PLATE COMPANY, Pittsburgh, Pa.

Lead gives light when darkness comes

BLACK clouds hide the midday sun. A storm breaks over a community. Everywhere people turn on electric lights.

In the emergency the power plant must supply electricity up to capacity. But only two of the generators are running. Where does the additional current come from?

The electrician turns on the current from many storage batteries. These batteries, made mostly of lead, provide the extra current until other generators are started.

Lead storage batteries are an essential part of the nation's life. They provide power for running farm machinery. They furnish electrical energy for ignition systems of tractors; for starting, lighting and ignition systems of automobiles.

Lead storage batteries propel street cars and electric vehicles. They operate drawbridges and railroad signals. They help to fire guns on warships and to propel submarines under the water's surface.

Where lead serves as paint

Lead aids man faithfully and well in the storage battery. Many millions of pounds of lead are in storage batteries in this country.

But lead serves the nation more generally as paint. For protecting metal surfaces against the attacks of rust, red-lead paint has long been the standard. It guards city skyscraper skeletons, bridges, gas tanks. Red-lead should protect your farm machinery and all metal surfaces on your farm equipment against rust.

Rust costs millions

Every year about $600,000,000 worth of machinery, tools and metal implements is made useless by rust. Farmers bear a great deal of this loss—a loss which paint would help to prevent. The harrow that lies half buried in dead weeds out back of the wagon shed; the hay rake that stands next to the fence near the end of the lane that leads to a marsh; the binder that is not under shelter—all these become sacrifices to rust unless protected by paint.

Where farmers keep their metal equipment protected by red-lead paint, that equipment is safe from rust, from rapid deterioration and eventual destruction.

Just as red-lead saves metal so white-lead keeps wood and non-metallic surfaces from rotting away. White-lead has been a standard protective paint for generations. Today you can see it everywhere in city and country. Like red-lead it sticks tightly to the surface, is impervious to air and moisture and lasts long.

Many pages of paint facts

If you want to know how to save the surface of wood, masonry or metal on your farm with paint, write for our "*Handy Book on Painting.*" This book is a store house of essential paint facts and formulas and will be sent to you free on request.

Producers of lead products

Dutch Boy red-lead and *Dutch Boy white-lead* are the names of pure red-lead and white-lead made and sold by National Lead Company. On every keg of these Dutch Boy products is reproduced the picture of the Dutch Boy Painter shown here. This trade-mark guarantees a product of the highest quality.

Dutch Boy products also include white-lead, linseed oil, flatting oil, babbitt metals, and solder.

National Lead Company also makes lead products for practically every purpose to which lead can be put in art, industry and daily life. If you want information regarding any particular use of lead, write to us.

HOARD'S DAIRYMAN

A WEEKLY [illegible] DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 19 Fort Atkinson, Wisconsin November 21, 1924

"My De Laval is milking my cows better than they were ever milked by hand"

So says a prominent breeder who is always careful about his milking. This is not an exceptional instance, in view of the evidence that is coming from De Laval Milker users, such as the following:

—"After using the De Laval Milker on our herd of forty cows we find that the cows respond freely to the machine. We believe this is due to its uniform action."

—"The action of the De Laval Teatcup is entirely different from all other makes of machines. It is mild and pleasing to the cow, causing her to respond quickly."

—"I can milk in just half the time with the De Laval, for my cows give down their milk better, and now instead of sitting in a barn and milking 23 cows by hand, I can just watch the work being done and it is a pleasure."

—"I say that the De Laval Milker will absolutely get more milk over hand milking and save so much time that it will pay for itself in a short time."

Ask for Reduced 1925 De Laval Milker Prices Now in Effect

And in this manner we could go on quoting from among the thousands of other satisfied users, proving the claims made for the De Laval Milker —that it

1. Increases milk production;
2. Saves time and labor;
3. Produces cleaner milk;
4. Makes dairying more pleasant;
5. Makes more money.

ABERDEEN MILK PRODUCERS' ASSOCIATION

HARRY J. BOYTS, SOUTH DAKOTA

A UNIFORM demand and a good price for milk has been established by the farmers of the community surrounding Aberdeen, South Dakota, (a city of 17,000) through the organization and operation, for three years, of the Aberdeen Milk Producers' Association. During this time the consumers of Aberdeen have had the cleanest, purest, and most healthful milk in the history of the city.

Our very recent visit to the health office of Aberdeen revealed the fact that this association is supplying the best quality of whole milk. The bacterial count of this milk is universally the lowest of any milk distributed in the city; the pasteurizing is absolutely right and the standard butterfat test runs over the requirements of the state law. The furnishing of a standard milk supply to the consumers has directly made a greatly improved market for the farmers. This is a fine example of a farmer's co-operative marketing association benefiting both the producer and the consumer.

Like many another community improvement that directly or indirectly has been of great benefit—there is a county agent in the story who has taken an unnamed leadership—shouldered all of the mistakes and troubles of the organizers so that there is little room for him to receive credit. W. C. Boardman, county agent of Brown County, has been the active man in this project.

In the fall of 1920, dairymen about Aberdeen began asking the Brown County Farm Bureau to work out a plan to improve the milk market. Finally, the Farm Bureau appointed George Ernst, a member of the board, and County Agent Boardman as a committee to call meetings and develop plans for co-operative marketing of the whole milk supply to the city of Aberdeen. Boardman says, "First, we held a volcanic meeting, at least every one present erupted." Then a milk survey was made which showed that there was less than one pint of milk consumed per capita and about the same of canned milk in Aberdeen. The consumers of milk did not know the value of milk as the quality was poor. The first step then was to educate the people to the value of good, wholesome milk. To do this we staged a milk campaign in December, 1921, with a corps of 12 speakers in charge of Miss Hoover of the Department of Agriculture and including state creamery men, extension dairy specialists, and nurses. We held meetings in every rural and city school in Brown County and every woman's club in Aberdeen. The speakers all talked milk as a food. This was followed by a tour of farm meetings where the care of milk was discussed. To get back to the marketing work—we studied the Twin City Milk Producers' plan of controlling the sale of wholesale milk. Later we held about eight meetings. The result was that the pool system, with a three-year contract, was evolved. For about a month milk was sold at wholesale to dealers, but lack of co-operation made it necessary to change the plans. Besides, an experienced manager was discharged and a cheaper man, lacking experience, was hired.

"The Aberdeen Milk Producers' Association then started its own bottling plant and retail business in Aberdeen. McDairmid—Slater Co., the largest retail grocery store in the city, and others have always sold the association milk because it is a quality product, and this has greatly aided in putting over the project.

"George Ernst, secretary, and E. E. Webb, president of the association, have stayed by the ship and the results have been mighty worth while."

ONE OF THE TRUCKS USED BY THE ABERDEEN MILK PRODUCERS' ASSOCIATION

About a year ago the city of Aberdeen began to enforce the milk ordinance which requires the delivery of high quality milk. The Milk Producers' Association has co-operated to the fullest degree with the health office in Aberdeen to furnish good, wholesome milk.

The new manager, G. A. Lee, an experienced milk man, says: "We are preparing the best product we can, but the biggest job we have is to educate the people to use the best product."

Every herd of dairy cows furnishing milk to this association has been tuberculin tested. In fact, every herd supplying milk to Aberdeen has to have this test in order to comply with the city ordinance and this law is being enforced. This movement has started a program to test every herd of cattle for T. B. in Brown County. The 35 farmer members have over 800 cows, which supplied more than 5,000 lbs. of clean milk, daily, to the consumers in Aberdeen during 1923 and returned a total of $74,770.00.

An up-to-date plant for handling the milk in Aberdeen has finally been equipped. The whole milk is received every morning. First it is passed through two thicknesses of muslin, then into enclosed vats, where it is heated to a temperature of 148 degrees to 150 degrees F. for a period of 30 minutes. The temperature of the milk is then dropped to 70 degrees F. in 20 minutes. The record of the temperature is registered by an automatic thermometer, so there is no guesswork about this. The milk is then passed over coils of cold water and finally over coils of cold brine, where it is cooled to 40 degrees F. From this the milk flows into an automatic bottler, where the bottles are filled, then to an automatic capper. No human hands touch the milk or inside of the containers. The milk is stored in refrigerators until delivered the next day. Every milk container and tube is thoroughly washed and sterilized with a live steam. This is one factory you can visit and then greatly appreciate the use of the product in your own home.

This is a fine example of co-operative marketing, where the results have been of great benefit to both the producers and the consumers. The farmers have benefited by:

1. Having a uniform market for whole milk at all times.

2. Having distributing costs lowered; for example, April 26th the consumers' price was reduced 20 per cent while the farmer's price was reduced only 9 per cent.

3. Getting the cost of production uniformly before the consumers.

4. Standardizing their product.

While the consumers have benefited:

1. By receiving the highest quality of milk ever sold in the city.

2. By having to pay a reasonable price for milk.

3. By having a dependable supply of good milk at all times.

4. By having a standardized product on the market.

Balanced Ration Best For Calves

Tests Show Self-feeder Method Not Satisfactory

HOARD'S DAIRYMAN:—That the self-feeder method of feeding calves is not profitable nor advisable because calves do not select balanced rations from the self-feeder but had a tendency to select the more palatable grains which produced fat rather than growth, is the general conclusion to be drawn from recent tests conducted by the South Carolina Experiment Station at Clemson College, S. C.

In these tests, conducted to determine the value of self-feeding as a method of feeding calves, three calves were allowed free access to self feeders, which contained in separate compartments: shelled corn, wheat bran, linseed meal, whole oats, corn meal, ground oats, velvet bean meal, bone meal, salt, and ground limestone. Three other calves were fed a balanced grain ration composed of 100 pounds corn meal, 100 pounds ground oats, 100 pounds wheat bran, 50 pounds linseed meal, and 3½ pounds salt. A ration of skimmilk and hay was given to all calves in the test.

Feeding Test Results

1. The calves given their choice between whole oats and whole corn and these same grains ground, selected the whole grains.

2. The calves fed by the self-feeder method made faster gains in weight than those fed the calf mixture. However, the calves fed the calf mixture grew faster in height, showing that the self-feeder calves tend to fatten rather than grow as did the calves which were fed a balanced ration.

3. Although the calves on self-feeder gained more rapidly in weight, these gains were also more expensive, because the calves on self-feeder consumed more feed but did not get a balanced ration.

4. The cost per pound of gain on the self-feeder calves was 12.4 cents, while the cost per pound of gain for calves fed on calf mixture was 10.4 cents.

5. The cost per inch of gain in height on self-feeder calves was $7.40, while calves on calf mixture the cost per inch was $3.20.

This experiment shows the importance of feeding young animals a balanced ration to keep them in good growing condition.

South Carolina. A. B. BRYAN.

THE WHATCOM PLAN OF TESTING

LINCOLN R. LOUNSBURY, WASHINGTON

TESTING associations have come and testing associations have gone, but we are still looking for a plan which will better deliver the goods. Each dairy state has come forth with some new plan or addition to an old one. The real test applied to my association is: "What does it cost the dairyman; does it help his business and is he sufficiently satisfied to sign the dotted line for another year."

Whatcom County, Washington, has a plan which has met those three requirements for the first year. The 165 members, owning 1,725 cows, paid out only $1.25 a year per cow for testing. They saved $3.00 per ton on each ton of feed used because of feeding balanced rations, and 1,500 of the 1,725 cows were signed up for another year at the annual meeting without special effort.

This association does not pretend to cure all ills, but it is working on a different basis and has completed volume one of its reports. What plan did they adopt? Well, they took the best features of the regular old line organization with some of the ideas of the testing circle or individual testing club, plus suggestions made by Dr. S. B. Nelson, director of the extension service of the State College of Washington.

To get at the beginning, in the state of Washington we have been using old type associations for a number of years. To A. B. Nystrom, now with the U. S. Department of Agriculture, who was formerly county agent in Lewis County, will have to be given the credit of "kicking over the traces". In 1918 he organized an individual testing association where the dairymen paid one dollar for membership fee in the "cooperative cow testing association" and 75 cents per cow per year tested.

In this association the dairymen purchased their outfits of scales, dipper, sample jars, and sample box for $4.30 and sent the samples into the county agent's office once each month. One hundred and ninety-two cows were tested during the first year and at the end Mr. Nystrom reported: "The writer is not ready to pronounce it a perfect success or is he ready to call it a failure."

This type of association spread to the counties of Island, Mason, Jefferson, San Juan, and others during the first year. There are still some six or eight such circles testing, but the bad feature of it was that if other farm work became too heavy the testing was forgotten. This bad feature was overcome in Island County by R. M. Turner, then county agent but now assistant director of extension service. Mr. Turner would deliver the sample bottles each month on the day before testing so the farmers would be reminded of their test and these bottles would be sent in the next day on the cream truck.

Whatcom County dairymen wanted some method of testing, but did not want the individual or regular association form. Director S. B. Nelson, of the extension service, together with County Agent H. B. Carrol, Jr., Don G. Magruder, and Frank Kehrlie, extension dairy specialists, got together and worked out a new method.

They took the part relative to the testing outfit and securing samples by the farmers, from the individual plan, put teeth into it by designating that the tester shall tell each member when to take the milkings for samples. This was where the Island County plan had been successful over the others.

From the old association plan they took the tester, but that is where they quit. They secured Guy C. Anderson, a graduate of the State College of Washington who had considerable knowledge about dairying, together with a lot of actual experience. His position with the association was a dual one, for to the dairymen for three weeks of the month he is the "tester", but to the extension service of the State College of Washington, he is for one week, "assistant county agent of Whatcom County". This comes about because the extension service is paying him for that week's work as an extension worker.

Many testing associations have gone on for years with nearly a new list of herds each year, held annual meetings and made reports but the testing has not been analyzed. Here is where they departed again from the usual type, for those records made last year were analyzed each month, Ninety-five per cent of the members adopted the plan of feeding rations, balanced for them by the "assistant county agent". Boarder cows were reduced in number by 104 during the year. By learning how to mix their own feed $3.00 per ton was saved in feed. Ten dairymen have agreed to buy better herd sires; improvements in the sanitation of five barns and five cream separators tested resulting in leaks stopped which were causing loss of from $2.50 to $25.00 per month.

The dairymen who belong to the association are receiving the aid of an assistant county agent who is a specialist in dairying as well as a tester to test their cows.

That one man can handle 1,725 cows and give their owners individual service sounds difficult, but the plan which we call the "Whatcom plan" may be explained as follows:

The county is laid out in ten routes with an average of 172 cows, owned by 16 members of the association per route. The tester makes two trips each month to the farms of the members, distributing and collecting sample bottles. To illustrate the method used, let us take the case of I. B. Larson who lives on one of the ten routes. Tuesday is the day set to collect samples on his route. The tester, Mr. Anderson, visits Mr. Larson Monday morning and delivers to him sample bottles so that he may take samples from Monday night and Tuesday morning's milkings.

At the time of the delivery of the sample bottles the tester takes up with Mr. Larson the record of his herd, made the previous month, and makes any suggestions for betterment that may appear from the record kept. If there is nothing to be taken up on dairy management problems, then it is not necessary to locate Larson, but merely leave the bottles.

Should the tester be unable to find Larson at home, or locate him on his trip of delivering bottles on Mon-

(Continued on page 590)

Testers' Judging Contest

B. ODERKIRK, IOWA

THIRTY-TWO testers from Iowa cow testing associations took part in the first testers' judging contest at the Dairy Cattle Congress.

Interest in the contest was intense because Mr. E. S. Estel, manager of the Dairy Cattle Congress, had offered gold, silver, and bronze medals to the three high ranking men respectively. The number of contestants would have been increased greatly had it been possible to hold the contest other than the last day of the show.

F. E. Ferguson and Floyd Johnston of the State Dairy Association ably served as judges and graded the contestants on the oral reasons given on their placings.

The rank of the ten high men and the prizes awarded were as follows:

First, C. H. Hostetler of the Dallas County Association, gold medal, watch fob; second, Chas. J. Moore of Linn County No. 2 Association, silver medal, watch fob; third, Herman Christiansen of Polk County Association, bronze medal, fob; fourth, Niel Nielson, Hardin County Association; fifth, Oliver Constable, Jefferson County Association; Sixth, Alvin Parsons, Belmond Association, Wright County; seventh, Joseph Day, Floyd County Association; eighth, Chas. M. Deem, Des Moines County Association; ninth, S. A. Mathre, Mason City Association; tenth, Thos. E. Hotchkiss, Davenport Association, and R. C. Munkwitz, Pioneer Association.

Cow testing associations can only be as strong as the men supervising them in daily contact with the members. It is often said that a man is judged by his accomplishments other than those he is paid for and expected to do. To a great extent this is true of the association tester. In selecting men for cow test associations it is the policy of those in charge to avoid hiring "mechanical testers" with a "get by" attitude and little interest other than in their salary checks.

It is interesting to note that the ten high men in the judging contest are highly trained for their jobs. Every man hired must have practical experience on a good dairy farm.

Of the ten high ranking men in the testers' judging contest is a graduate of Illinois University and one of the University of Wisconsin, a four-year graduate of Iowa State College, a senior student at Manitoba Agricultural College, Canada, two veteran testers with three years' experience and educated in Europe, one graduate of a short course in dairying at the University of Minnesota, and the others have completed the herdsman's short course or two-year agricultural course at Iowa State College.

The following shows some of the additional voluntary service rendered by testers.

R. C. Munkwitz, tester of the Pioneer Association, made a good showing in feeding improvement in his association, kept a very neat and accurate set of books, coached a junior club judging team and a demonstration team which won third place at the National Dairy Show in competition with teams from other states. He also conducted an association tour in September and had a picnic in June.

Many of the testers are calf club leaders in their communities. Several testers have made a notable increase in the amount of home-grown legume crops by testing soil for acidity and encouraging the use of lime.

One tester has considerable ability at culling chickens as well as cows. As a result he has been in constant demand by the women of the community who realize that their flocks are not paying. This tester culled 150 hens from one flock and the owner only received five eggs from the culls in the next four days.

We find testers assisting members in fitting cattle for the show ring, by clipping, polishing horns, trimming hoofs, teaching new breeders the essential points of the show ring, and assisting in other ways.

Several testers brought calf club calves to the Dairy Cattle Congress and assisted the club members in fitting. Throughout the state we find the testers taking an active part in the progressive movements for better live stock.

There is a great future for developing the annual dairy cattle judging contest. Other states have signified an interest in sending contestants to Waterloo another year.

An efficiency contest for testers has been started for the coming year. A gold watch will be awarded to the winner. Testers will be graded upon their aggressiveness, general improvement on the farms as a result of their efforts, scrub bulls replaced, the annual association tour and picnic, neatness and accuracy of records, and promptness in mailing in reports to the Extension Service. To avoid rivalry and any temptation to use uneconomical practices in making high association production averages, very little regard in the efficiency contest will be given to production of the herds.

TESTERS FOR IOWA COW TESTING ASSOCIATIONS COMPARING DAIRY COW FORM IN THE FIRST JUDGING CONTEST OF THIS KIND AT THE DAIRY CATTLE CONGRESS

Willie: I wonder if Dad thinks the calf is goin' to die.

Mother: Why, Willie?

Willie: Well, he said I could have it to start a herd.

Gladstone said, "One demonstration is worth a thousand arguments."

Highest Farm Labor Income

E. M. CLARK, OHIO

WAYNE County, Ohio, is one of the many good Holstein and general farming communities in the state. In fact the farm accounts kept by the Rural Economics Department of the Ohio State University show that the farm labor income was highest in Wayne County for 1923 of all the various counties in which accounts are kept.

MR. SNODDY WITH ONE OF HIS A. R. O. COWS

It was cows like this one that made it possible for Mr. Snoddy to receive the largest farm labor income in Ohio for 1923.

Mr. A. V. Snoddy of Wayne County, had the largest labor income in 1923 of all the farmers who kept farm accounts with the Ohio State University. And Mr. Snoddy has attained this success by dairying with a Holstein herd of cattle. It might be well to explain just what is meant by farm labor income. The university keeps accurate account of all items of expense and income as well as cost accounts on the various farm crops and the different classes of live stock. By so doing the exact cost of production of the crops and the efficiency of the live stock is determined. At the beginning of the year and at the end of the year a very careful inventory is taken. This inventory taken into consideration with the items of expense and the items of income determine the farm income for the year. By deducting the interest on the investment from the farm income the farm labor income is derived.

It is too often thought that one has to have a large farm to make a large labor income. Such is not necessarily the case as proved by Mr. Snoddy's farm of 76 acres, 63 of which are tillable. Mr. Snoddy's system of farming is as follows: He has his farm divided into five fields, two of which are kept in a two-year rotation of wheat and potatoes, and upon the other three fields a rotation of corn, wheat, and clover is maintained. His cash crops are milk, wheat, and potatoes, milk being the largest source of income. The manure from his dairy herd, together with the application of limestone and other purchased fertilizers, keeps the farm very fertile. Last year Mr. Snoddy's potatoes averaged 245 bushels per acre and his wheat 36 bushels per acre. The farm furnishes all the silage, clover hay, and corn for grain that his live stock demand.

A. V. SNODDY OF OHIO AND TWO OF HIS SONS. BOTH OF THESE BOYS ARE MEMBERS OF THE WAYNE COUNTY HOLSTEIN CALF CLUB

Mr. Snoddy's labor income for last year was $3,092. Naturally his Holstein herd contributed most to this splendid income. His herd at present is composed of 19 head, all of which are registered. A few years ago Mr. Snoddy started with a herd of grade Holsteins, but he has been gradually replacing them with registered cattle. The source of income from the herd in the past has been almost entirely from the sale of milk. However, from now on he should have an added source of income from the herd in the sale of breeding stock. The herd sire used by Mr. Snoddy is out of a cow that Dr. B. Studer sold in the last State Holstein Sale to R. E. Ansted. She was fresh before the sale and made 29.29 pounds of butter and 621 pounds milk in seven days and she is now on yearly test and bids fair to make over a thousand pounds butter. This cow is sired by Risinghurst Johanna Ormsby De Kol who has 32 A. R. O. daughters. Mr. Snoddy's bull is sired by Champion Model Johanna, thus carrying three crosses to the Risinghurst bull. Several of the cows in the herd have seven-day records up to 28 pounds. Last year the milk sales amounted to $3,500 from 15 milking animals which included four 2-year-olds and three 3-year-olds. The herd is accredited.

Mr. Snoddy was formerly a renter before buying this farm. He has a family of seven children, the two older boys being members of a Holstein calf club. Mr. Snoddy's idea of successful farming is not how many acres or how many cows, but how many good acres and cows. Get the best and work them to the limit of their economical production.

THE DAIRY BARN ON MR. SNODDY'S SUCCESSFUL 76-ACRE FARM IN OHIO

Fighting Thistles With Alfalfa

H. W. WARNER, Iowa College of Agriculture

HAVING the herd in a cow testing association shows business sagacity. Growing alfalfa for the herd forecasts a profit-making ration. But having the high herd and the high cow in the test association for June, 1924—with grade Shorthorns, at that—is real achievement.

The herd that lead its league, the Big Four Cow Test Association, and the leading "hitter" of the league belongs to A. W. Oxley of Winneshiek County, Iowa.

Although living some 200 miles from Mr. Oxley's farm I had several times heard "Oxley's Shorthorn cows and his alfalfa" mentioned in a very commendable way. When County Agent C. W. Dack of that county organized an "Alfalfa Tour" I was more than willing to be present, for the windup station on the tour was Oxley's farm.

What I found was a modest farm home, a fair silo, some average barns and outbuildings, a "flivver" and—grade cows. Just the same kind of buildings and equipment that one would find on the average live stock farm in that corner of Iowa and all serving to demonstrate that heavy investments for equipment are at least secondary to good feeding and management in the profitable conduct of a dairy herd.

Thirty or forty of us followed him across an 11-acre field from which 30 loads of alfalfa hay had been taken only three weeks before, an average of 2¾ loads per acre. The next crop was already 16 to 20 inches high and of excellent color and quality.

Arriving at the edge of an oat-stubble field we stopped suddenly. Our advance was blocked by a 100 per cent stand of Canada thistles grown well above the stubble and presenting an ugly picture in contrast with the alfalfa field we had just crossed.

Down among the stubbles could be seen a healthy looking stand of young alfalfa plants despite the barbed-wire entanglements of thistle all about.

"Don't reckon you'll have much alfalfa here, will you, Oxley?" someone asked.

"Plenty of it but it's going to be hard on the thistles. I put alfalfa here to kill out this patch of Canada thistles as much as for anything else. Just about a year from now you won't find a live thistle in this alfalfa seeding unless something happens to the seeding this winter."

Some of the alfalfa "tourists" accepted Oxley's statement at face value. I'm not sure but that I was one of several in the party who wanted further demonstration.

Oxley seemed to sense the situation and was ready for it.

"Now take a good look at this thistle patch and then come with me while I show you what there is left of one I had last year that was just as bad as this."

He took us to a place in another alfalfa field of 10 or more acres where the year before Canada thistles had reigned unchecked. Diligent searching for 10 minutes by almost the entire group brought to light two sickly looking and badly beaten thistle plants. Further proof was not needed to convince everyone that, however beneficial to soils and live stock, alfalfa is not conducive to the greatest success with Canada thistles.

"It has taken me 20 years to learn how to grow alfalfa that will whip thistles and make 4 or 5 tons of hay to the acre, but with what we know now of liming and inoculation there's no reason for failure with alfalfa if it's put in right."

The next and final stop was in a 7½-acre pasture near the barns where there appeared to be enough cows grazing for twice or three times that acreage.

These 7½ acres had furnished abundant pasturage for 15 milch cows, 4 other animals, and 40 or 50 hogs since spring. And we were then wading in a dense 8-inch growth of bluegrass and alfalfa.

"The cream check for May from this alfalfa-bluegrass pasture was $161 besides all other stock I had on it. I figure it made me better than $20 an acre for that one month, for it's all the cows had to eat."

Mr. Oxley didn't advance this as any argument against more varied and better balanced rations. He did make the statement, however, as first hand experience and convincing testimony to the value of alfalfa for milk production.

"How did you get so much alfalfa in this bluegrass pasture?" they asked.

But that wasn't the way it happened—the alfalfa was there first. About 7 years ago Mr. Oxley had seeded the piece to alfalfa and for several years had maintained it as permanent meadow, pasturing it at times. The bluegrass had crept in until it was about a 50-50 alfalfa and bluegrass mixture.

A very noticeable thing in this pasture was the dark color of the bluegrass—it was actually blue, not green. The liming of the soil and the fertilizing effect of the alfalfa were being reflected in the grass.

Mr. Oxley has good reasons for being enthusiastic about alfalfa. It has enabled him to get rid of one of the most troublesome and pernicious weeds found anywhere, which is no small thing. It has made possible the economical production of butterfat, which is more important. In 1923 for every dollar's worth of feed consumed by his cows he received $2.02 worth of butterfat. Then, too, it has proven dependable when bluegrass and other forage crops have failed. Last year, 1923, northeast Iowa suffered from a very severe drought. Pastures dried up almost entirely during August and the herds in this cow test association lost an average of about 10 pounds in butterfat production. Oxley's lost only 2 pounds during that month.

Whatever may be said for or against dual-purpose cows there seems to be but one side to the question of alfalfa as a dual-purpose crop. On this farm it has demonstrated its dual-purpose as milk-maker and weed-eradicator, not to mention its soil building qualities.

Six Years of Record Keeping on a New England Dairy Farm

JOHN J. ELLIS, MASSACHUSETTS

SOME time ago in an article published in Hoard's Dairyman I made the statement that I believed that dairy farmers should not be too strongly urged to feed more grain than many of them were doing in order to increase the average milk production per cow. My reason was that I thought the average good dairyman knew about the point of intensity of production that paid him best. At that time I thought the point of profitable milk production was not much above 7,000 pounds per cow when average milk and feed prices were considered. Since writing that article I have completed the compilation of some figures based on the records of a Holstein herd for the past six years. These figures seem to show that a herd of good Holstein cows can be fed grain heavily enough to raise the average to between 9,000 and 10,000 pounds of milk per cow at a good profit over feed cost. At the same time they show that when fed more heavily than this the profit steadily falls even though the milk production increases. Perhaps many dairymen will be shocked at the thought of feeding over a ton of grain to each cow in a year but it has proved profitable.

These records extend over a period of six years, from 1918 to 1923 inclusive, during which time the average number of cows in the herd was 13.3. The records are for calendar years, that is from January 1st to December 31st, and they include all dry cows but no young stock. The highest production made by any one cow during the time covered by the records was 17,636.9 pounds of milk and 663.76 pounds fat made in ten months, the cow being milked only twice a day after the first 45 days. The make-up of the herd has changed from time to time but over 50% of the original cows remained in the herd during the whole period of the records. The figures clearly show that the average quality has greatly improved, due to eliminating poor producers, but that does not invalidate the conclusions that can be deduced from these figures.

Prices paid for grain and received for milk each year are given in Table I. I include in this table figures showing the relation between the price of milk per 100 pounds and the cost of grain per 100 pounds as it is interesting to note how closely these prices conform each year except 1918 and 1919. It is evident that there is some relationship between the two but any one able to tell if the grain price follows the milk price or the contrary, would be able to answer the old question as to which was made first, the hen or the egg. However, it seems safe to say that the farmer in this locality can expect to pay an average of 82.7 cents per 100 for his grain for each $1 per hundred he gets for his milk.

Table I—Prices Paid for Grain and Received for Milk

	1918	1919	1920	1921	1922	1923	Ave. 6 yrs.
Milk per 100	$3.90	$4.10	$3.90	$3.00	$2.80	$2.82	$3.42
Grain per 100	2.46	4.23	3.38	2.57	2.04	2.32	2.83
Per cent of grain cost to price of milk	63.0	103.1	86.6	85.6	72.8	82.2	82.7

In Table II is given the milk production for each year, pounds of grain fed per cow, etc.

This table shows that the highest milk production per cow was in 1923 when the average was 11,987 pounds and also that the largest amount of grain fed per cow was in the same year. The year 1918 shows the largest returns for each pound of grain fed as the ratio for that year was 1 pound of grain for each 6.13 pounds of milk produced. The lowest return was in 1923 when only 2.52 pounds of milk were produced for each pound of grain fed.

Table II—Milk Production and Grain Consumed

	1918	1919	1920	1921	1922	1923
Ave. production milk per cow in lbs.	6,515	6,312	8,587	10,313	11,607	11,987
Grain fed per cow in lbs.	1,063	1,288	1,719	2,374	4,231	4,795
Ratio grain to milk in lbs.	1—6.13	1—4.88	1—4.99	1—4.34	1—2.74	1—2.52
Spread in lbs.	5,452	5,024	6,868	7,939	7,376	7,192
Ave. number of cows	12.7	12.0	14.0	11.4	13.1	16.7

At first thought it would seem that the year 1918 returned the largest profit over grain cost and 1923 the lowest profit, but this is really not the case. In order to show this I have included in Table II figures for each year, which, for want of a better term, I have called "spread". This spread is the difference in pounds between the pounds of grain fed and the pounds of milk produced. For example, in the year 1918, 6,515 pounds of milk were produced and 1,063 pounds of grain fed per cow. The difference between these two amounts is 5,452 which is the spread in pounds for that year. When this spread is noted for each year we find that it was largest in 1921. In that year the return for each pound of grain fed was only 4.34 pounds of mlik but in spite of this the largest spread was in this year and not in 1918 when the return for each pound of grain fed was 6.13 pounds of milk. It will also be noted that with each increase in grain fed the return or spread increases until the ratio is 1 pound of grain for each 4.34 pounds of milk but beyond that point the spread decreases as shown in the years 1922 and 1923. In these last two years the ratio of grain fed was 1 to 2.74 and 1 to 2.52 but even then the return or spread was greater in these years than in the earlier years when the ratio ran as high as 1 pound of grain to 6.13 pounds of milk.

This would seem to indicate that the danger of financial loss from overfeeding grain is not very great provided the health of the cow is not injured. In fact it looks as if a cow is not at the point of greatest profit until she produces from four to four and one-half pounds of milk for each pound of grain and also that she is not at the point of greatest profit when producing at a ratio much higher or lower than that. I do not mean that cows should always be fed at a ratio of 1 to 4 or 1 to 4½, because a fresh cow would not get enough grain and one well along in lactation would get too much. I simply mean that in this herd when a cow produces an average of 1 to 4½ pounds of milk a year for each pound of grain consumed she seems to be at the point of greatest profit and that these figures seem to show that it is more profitable to overfeed than to underfeed.

To show more clearly the effect of the above figures the value of milk per cow, value of grain and gain over grain cost has been worked out for each year in Table III. In order to make a fair comparison the average prices of milk and grain for the six years have been used, that is grain at $2.83 per 100 and milk at $3.42 per 100. This gives a milk price higher than can be expected in these days but does not invalidate the figures in any way.

The cost of hay, silage, and other roughages has not been included in Table III as the object is to concentrate attention on the fact that it is possible to feed grain much more heavily than is usual and still make increased profits per cow. In the year 1918 when 1,063 pounds of grain were fed, the gain over grain cost was $192.73 per cow while in 1921 the gain per cow reached its highest point, $285.42, when the cost of grain was $67.28. It is interesting to note that when the cost of grain per cow rose to the high point of $135.70, as it did in 1923, the gain per cow was still higher than it was in the first three years when the grain cost was less than one-third as much.

Table III—Value of Milk per Cow at $3.42 a Hundred and Cost of Feed at $2.83 a Hundred

	1918	1919	1920	1921	1922	1923
Value of milk	$222.81	$215.87	$293.68	$352.70	$396.96	$409.82
Cost of grain	30.08	36.45	48.65	67.28	119.74	135.70
Gain over cost of grain	$192.73	$179.42	$245.03	$285.42	$277.22	$274.12

Another point that is frequently overlooked is the fertilizer value of these feeds. Dairy farmers who are in the habit of buying mixed fertilizers would put money in their pockets if they would buy more concentrates to feed and less chemical fertilizer as they would get two profits, one as feed and one as fertilizer. This farm was in a badly run-down condition seven years ago when the policy of heavy grain feeding was started and today it produces an average of 2½ tons of timothy hay per acre and other crops in proportion. This has been brought about by the use of rich manure reinforced with a little acid phosphate. Less than one ton of mixed fertilizer has been bought in the seven years.

In Table IV is given the return per cow for each of the six years based on the actual prices received and paid for those years. It is here seen that the highest return above grain cost was $276.79 per cow in the year 1920 when the average production per cow was 8,587 pounds of milk. As we have already seen that with the average prices for six years the highest return was in 1921 with an average production of 10,313 pounds it at once becomes evident that the highest profitable herd production is somewhere between 8,587 and 10,313 pounds. When the spread in Table II and the gain in Table III is examined it seems probable that the most profitable production is very close to 10,000 pounds per cow.

To sum up these figures it looks as if a dairyman owning heavy milking cows should feed enough grain to get an average production of close to 10,000 pounds. Table III clearly shows that he is not making full profit per cow below that point and that it is doubtful if it is good judgment to try to force the herd average much above that point, although there seems to be less danger of loss from overfeeding than is likely to come from underfeeding.

Before closing it is perhaps well to give some idea as to the methods of feeding used in this herd. The roughage was corn silage and mixed clover and timothy hay, as it has not yet been possible to grow alfalfa. The cows have rather poor pasture for about five months during which time they are fed soiling crops such as sudan grass or green oats and sometimes silage and hay if the pasture is short. They are also fed grain in nearly the same amounts as in winter. All the grain is purchased, as it costs much less to buy it than it does to raise it on the farm. The reason for the great increase in grain fed in 1922 and 1923 was that over half the cows were on yearly semi-official test, during which time they were fed to the limit of production without regard to cost.

It is to be regretted that in none of these years was alfalfa used as the hay part of the ration, as it would be interesting to note whether or not its use would make it possible to reduce the amount of grain fed without reducing the milk production. However, it is hoped that enough alfalfa will be raised to feed a part of the herd for the next two years.

Table IV—Value of Milk per Cow and Cost of Feed According to Prices Prevailing Each Year

	1918	1919	1920	1921	1922	1923
Value of milk	$254.09	$258.79	$334.89	$309.39	$325.00	$338.03
Cost of grain	26.15	54.82	58.10	61.01	86.31	111.24
Gain per cow	$227.94	$203.97	$276.79	$248.38	$238.69	$226.79

KATE OF FARVIEW

H. H. Buckley of New York, the owner of Cathedral Farms, owns a new Guernsey class leader. The cow is Kate of Farview and her excellent record in class B consisting of 19,227.8 pounds of milk and 905.65 pounds of butterfat gives her fourth place in that class. On October 21, 1922, Kate of Farview started her test at the age of four years, ten months, and eleven days and she reached her maximum flow of milk, 60.5 pounds, in six weeks. Her persistency as a milker is demonstrated by the fact that she maintained a milk production of over fifty pounds daily for the first ten months of her record. During July which was her ninth month, she averaged fifty-seven pounds of milk per day and she finished her year still producing 40.9 pounds of milk.

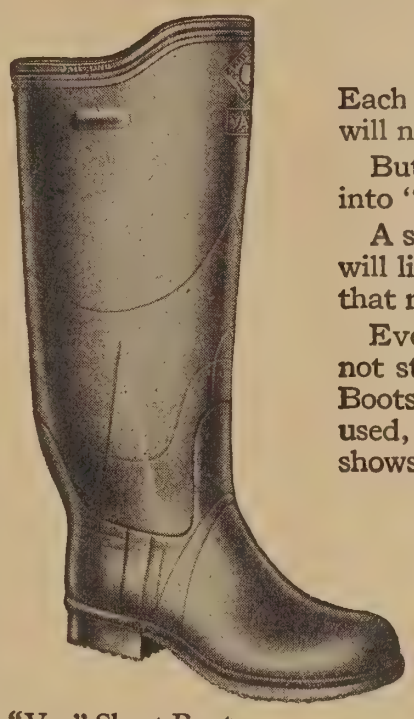
Kate of Farview now holds the world's record in the Guernsey breed for milk production under the age of five years. She also has a class D record of 12,760.1 pounds milk and 620.32 pounds fat.—The American Guernsey Cattle Club.

Friendly Talks for Farm Folks

The Holstein breed is marketing its milk under the *nom de plume* of "White Nectar". We suggest, gratis, that Guernsey milk be called "Yellow Delight"; that Jersey become "Cream of the Cow"; that Ayrshire be known as "Good Health's Food", and any other also-running milk always spelled with a capital "M" because it is so important in the human diet. Personally, we think this idea of advertising milk is clever and interesting, and it all serves to draw attention to any kind of milk and so helps in focusing the lime-light on this greatest of foods. If we can only get folks to talking about milk and speculating as to whether Holstein or Guernsey or Ayrshire is the best, the result will be to increase consumption of each family's or person's favorite, and to encourage a study of this food which merits much more than the taken-for-granted attitude and perfunctory interest hitherto displayed. A great many people view all milk as "milk", whereas the fluid from the different breeds is as unlike as brands of fruit and vegetables put out by different companies. Each breed specializes, and in this age of specialization, Americans should take kindly to the new advertising wherein the merits of each fluid is brought to light. We are all anxious—Guernsey, Holstein, or Jersey man—to increase the consumption of milk, and this writer for one believes that any means to that end is a step in the right direction. When consumers understand that there is a vast and interesting difference in the milk delivered to them daily, we believe the resulting talk and study will increase instead of decrease consumption. Milk can afford to be picked apart and analyzed to the last degree—it has nothing to hide, no matter from what breed of cow, if sanitarily produced. And the average drinker is going to find more romance and imagination in his glass of "White Nectar" and so on than in a glass of just milk.

John Charles Fremont explored the good state of Ohio ninety years ago. Wait a minute! Can it be possible that Ohio is as young as all that, not to mention the mighty states beyond her borders? What a flapper among nations is this America, at best!

The newspapers print a story that some professor of science over in Berlin is making gold from quicksilver. While no doubt of vast importance, the average American dairyman is more interested in the possibility of making some gold out of milk in the dim future—if he doesn't die first.



If the kids in this country can't be made to work as per the proposed law, we will see, if it is enacted, a disregard for the order which will make the flouting of the prohibition act fade into insignificance. Wise parents would simply ignore any such amendment and public opinion would uphold them. Why make laws which are made to be outlawed?

Sim Rathbun is always complaining of appendicitis pains through the summer, and being awful careful of his eating; but just as sure as the first cold days come with a touch of snow and ice, Sim's appendix calls loudly for buckwheat cakes and maple syrup and hot, sugar-coated doughnuts. Then you never hear anything about pains below the belt until next summer.

New York. HELEN S. K. WILLCOX.

It Takes 30 People to Make Each "Ball-Band" Boot

—and every one of them does his work by hand

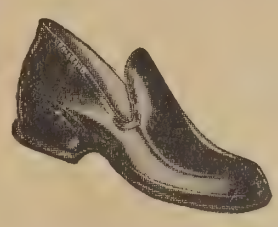
"Vac" Short Boot
Feels like velvet
Wears like iron

Each one of these 30 workmen has to do his best or the work will not pass inspection.

But it is more than fine workmanship that puts the wear into "Ball-Band" Footwear.

A strip of "Ball-Band" Boot Sole Rubber an inch square will lift hundreds of pounds, but it is more than tough soles that make them wear.

Ever stop to think that boots and rubbers more often than not start to wear out at the lining? In such footwear as Boots and Light Weight Rubbers, where cotton linings are used, they are so thoroughly impregnated with rubber that it shows through—you can see it—look at it. But that is only one other reason for the promise of the good old Red Ball—the promise of More Days Wear.



Over Ten Million People have stopped asking the reasons. They *buy* "Ball-Band." They know that whatever is good in rubber footwear must be in "Ball-Band" because "Ball-Band" delivers the service.

One-Buckle Cloth Arctic
Sturdy, warm and well fitting

Look for the RED BALL

Look for the Red Ball. It is on every pair of "Ball-Band" Rubber and Woolen Footwear. If your dealer does not handle "Ball-Band" write for dealer's name and the free booklet, "More Days Wear." It shows many kinds of Boots, Arctics, Light Rubbers, Work Shoes, Sport Shoes, Wool Boots and Socks—something for every member of the family.

Women's Argo Slipper
Neat and attractive

You don't ask your friend if he is honest—you know that he is. You have tested him and he is true.

That is why "Ball-Band" has more than ten million friends. When you buy "Ball-Band" (Red Ball) you buy with confidence—you belong to the more than ten million who are sure of their friends and you get the foot comfort and long wear that you expected and more too.

We make nothing but footwear and we know how

Who Drinks the Most Milk?

The U. S. Department of Agriculture, co-operating with the Pennsylvania Department of Agriculture, has just recently completed a milk survey among 400 Philadelphia families which shows some of the factors that influence the amount of milk consumed.

Eight groups of families of 50 each divided according to income, race, and nationality were included in the survey. The Jewish group was the highest in consumption of milk and the Italian and Negro groups were the lowest. The negro group, though lowest in consumption of whole milk, was highest in buttermilk.

A larger percentage of children under three years of age drink milk than do those older.

Fifty-five per cent of the reasons for drinking milk gave the "like it" answer. Twenty-five per cent of the reasons gave health and food value. For those who did not drink milk, forty-nine per cent said they did not like it.

Seventy-seven per cent of those surveyed said that a fluctuation of a cent or two in price either way made no difference in the amount consumed. Changing seasons do not materially affect the amount consumed.

Fresh vegetables and meat are considered the foods of greatest importance. Bread and milk come next.

Only 23 out of 400 housewives knew that milk was cheaper in Philadelphia than in other large cities.

Fifty-four per cent of the children were drinking milk in school. This had a tendency to increase the amount used at home.

First class restaurants use more milk per person and lunch rooms least. Milk is sold more for drinking in cafeterias than in any other class of restaurants.

White Beauty Bargenoch, an Ayrshire owned by Jordon F. Atwood of Maine, just completed an Advanced Registry record of 13,270 lbs. milk, 650.82 lbs. fat, which makes her the senior four-year-old champion of the Pine Tree State.

As a junior two-year-old she completed a record of 9,290 lbs. milk.—Ayrshire Breeders' Association.

FREE *this* BAG *of* Top-Kream Minerals

Science has produced Moorman's Top-Kream Minerals—a thoroughly tested mineral feed for dairy cows—a splendid appetizer. **Produces Larger Profits—Better Calves—Less Abortion—in many cases More Milk.** Phillip Thenis, of Illinois, fed 500 pounds—it stopped abortion—increased the milk flow. E. J. Koehnle, of Iowa, got increased milk gains from 1 to 3 pounds per cow per day. Few realize it but their cows are mineral starved. Now is the time to stop these losses. Top-Kream Minerals will do it.

Get a Bag FREE

Test it yourself. To advertise this wonderful product—to give every dairyman the benefit of knowing about it, we'll send a sample bag, Free—no obligation—enough to feed 24 cows. Feed it yourself—let your cows be the judge. You'll find they like it.

Don't Wait—Accept Now

Clip and mail the coupon today. Try Moorman's Top-Kream Minerals and profit by their benefits. Act now! The bag is Free—no obligation.

EDITORIAL COMMENT

A SUCCESSFUL PRODUCERS' ASSOCIATION

Elsewhere in this issue we publish an article regarding the Aberdeen Milk Producers' Association. Before this organization was formed, the milk supply around Aberdeen was not as good as it should have been and the farmers were not receiving a price for milk in keeping with its cost of production. The farm bureau in that section, together with the county agent, joined hands and laid plans to improve the milk supply of Aberdeen and to secure better prices for the milk producers. What was done, how it was done, and what results have been accomplished are described in the article prepared by Mr. Boyts.

From his description the plan to solve the problem of a better milk supply and to secure better prices meets our heartiest approval. The producers did not make the mistake of simply asking a larger price for their milk, but they also took steps to produce a better product and to establish undoubtedly a more efficient system of distribution. We rather hesitated to urge producers to distribute milk in the city, for they felt it was better for them first to learn how to prepare their product and to sell it to dealers whose business it is to distribute it. This is particularly true in large cities where milk distribution requires much experience and skill to do the job well and economically.

There are many opportunities, however, in this country to do exactly what the milk producers have done around Aberdeen. Their work will increase the consumption of milk and secure a better price so producers will do away with many conditions which are at present rather prevalent in several sections of the country.

CHILD LABOR AMENDMENT

We have stated upon several occasions the reasons why we are opposed to the proposed child labor amendment to the federal constitution. If this amendment were ratified by three-fourths of the states, it will give Congress the opportunity to regulate, prohibit, and control the labor of persons under eighteen years of age. A law of this character could never be enforced upon the farm. The enactment of laws that do not have sufficient sentiment back of them to carry them into effect are worse than worthless. They teach people to disregard all laws and that is the beginning of the end of our civilization. We must respect law, for through this attitude comes order, while through disregard for law comes chaos. Imagine the busy mother on the farm who had several daughters ranging from ten to eighteen years in age, being unable to call upon any one of them to do so much as wipe a few dishes or set the table or do any one of the many hundreds of jobs necessary about the house.

Imagine the father, especially during the busy season, who couldn't call upon his boys until they were eighteen years of age to assist him in doing any of the work of the farm. This would not only handicap the owners of farms in getting their labor done, but the injury done their children would be immeasurable.

How often men at the head of some big business, such as a railroad executive, a manufacturer, or even as President of the United States, point with pride and satisfaction to the time when they were engaged in some regular work on the farm. We are told that a very large majority of men directing the big affairs of this nation were born and raised on farms. It is not because farm people are of different blood than those of the city, but it is due to the fact that many jobs on the farm are well suited for children to discharge and to do them regularly. This imposes upon them a responsibility, giving opportunity to develop initiative and stick-to-itiveness which in after years helped them to rise to positions requiring large ability.

We must give all our boys and girls an opportunity to secure an education and to become strong men and women, and if our state school laws are enforced they will not be denied this opportunity. We see no necessity of giving Congress a chance to regulate and prohibit the labor of children under eighteen years of age.

A MARKETING PROBLEM

In recent years many co-operative milk producers' associations have been formed throughout the country. Officers and directors of these organizations have, on the whole, been doing their best to market the producers' milk with less expense and to secure a better price for it. Some of the men who helped form and direct these co-operative marketing companies have failed to understand the real purpose of co-operation and have, at times, advocated unsound practices and made promises which could not be fulfilled. It has been too common for these men to state that if the farmers organize, their problems will be solved and a high price can be obtained.

We can appreciate the necessity for securing a higher price for milk, but it cannot be accomplished through organization alone. Organization has its place, and a very large one, but to state that all farmers know how to produce and that organization is the only step necessary to secure satisfactory prices is misrepresentation and an unsound position. It has been mighty costly in several instances. It has caused co-operative marketing companies to fail, and in places where they were sorely needed to assist the farmer in securing a better price for his products. We note with a considerable degree of satisfaction that many of the men who once took this false position have either changed their minds or have been eliminated from the active management of co-operative enterprises.

The officers and directors of these co-operative marketing agencies are fast seeing that their problem is vastly greater than simply organizing and handling the milk of the producer. They see it is necessary for the farmer to pay some attention to the cost of producing his products, for when they do there will be no overproduction.

We cited a most striking instance some months ago of a farmer who produced surplus milk at a loss to himself and to the association which was handling it. This man owned thirty-six cows. He placed them in a cow testing association and at the end of the year he had the records of production of each cow and the approximate amount of feed consumed by each one. When he divided his herd of thirty-six cows into two groups he found that eighteen of his best cows had yielded him a profit over feed consumed, while the eighteen poorest cows did not pay for feed consumed. It took some of the profit of the eighteen best cows to pay for the feed devoured by the eighteen poor ones. However, the eighteen poor cows produced 71,000 lbs. milk, which was surplus in the market. The co-operative association to which this man belonged was attempting to get better prices for the producers' milk, for they were entitled to it. It was impossible to accomplish this for too many producers were milking poor cows. It was these poor cows which were producing the surplus.

It seems to us the various milk producers' associations and co-operative marketing agencies could do no better work than to direct themselves to establishing cow testing associations. Poor cows must be eliminated and it would be well if these organizations would start a campaign to reduce the herds of their members at least 10%. It has been shown that at least one-third of the cows in this country do not pay for feed consumed. Why keep them?

Successful marketing starts with production and, since this is true, it is wholly within the scope of all co-operative marketing companies to devote themselves to economic milk production. The cow testing association is the best form of organization to get the farmers to eliminate cows that do not pay for their board. This is a big job, but it is the real foundation in successful marketing of milk.

GUARANTEEING SUCCESS IN DAIRYING

In order for the Danish dairymen to more completely master all branches of the dairy industry so that there is a tendency towards a reasonable stabilization of their business, it has been necessary for them to do certain things. It will be interesting if not helpfully suggestive to dairymen in the United States to know some of the things that the Danish dairymen have found necessary to be done in order to insure a guarantee of reasonable success.

"They are signed up under a binding contract to deliver all of their milk, except for household purposes, to their co-operative associations for periods of from ten to twenty years."

It seems from this that it has been necessary, through the long-time contract, to insure to the dairy association management a guarantee of dependable volume of product. This enables the management to plan a program and stick to it.

"Each dairyman is required by contract to deliver every day, either to the association or its milk collecting agencies, a product that is sweet and in good condition."

In the development of their marketing associations, these men have found by experience that standardized quality products are most successfully merchandised. They have finally learned that it is bad business to attempt to do the impossible—make a high quality product from a second or third rate raw material.

"Over half of all the dairy cows in Denmark are in cow testing associations."

They have recognized, largely perhaps through experience, that the elimination of the low producing cows is an economic necessity.

"No dairy association can export butter unless it comes up to the standard of the 'Lur' brand and unless the association has received authorization from the Department of Agriculture."

This is a safeguard towards maintaining the confidence of consumers in Danish butter.

"No person is employed as manager of a dairy association or as buttermaker unless he has had five years' practical experience."

This bears no little relationship with the safeguarding of quality of product and efficient management.

"Each manager of a dairy association or buttermaker is required by contract to make a certain standard, grade, or score of butter for the entire year. On all of the butter that scores over the required standard the employee receives a bonus. But if he fails to make the required score he stands the loss out of his wage."

This is another way of saying that these men must know the business for which they are hired or get off the pay roll.

While the conditions under which the Danish dairymen operate are much different than those in the United States, at the same time a program of, (1) economical production of milk on the farm, (2) the production of a sufficient volume within the territory of the manufacturing plant, (3) quality of product and, (4) efficient management are no less important to be considered by the dairymen of this country.

If cow testing association work did not pay, would the Danish dairymen maintain over 800 associations in their small country?

Changing Pulsations on Milker

Do you consider it an advantage to have a milking machine with a pulsator in which the suction and relief can be changed to suit individual cows?
Snyder, Colo. R. N. W.

There is no doubt but that in certain instances it is advantageous to be able to regulate the length of the suction and relief stroke on the pulsator of a milking machine. However, in connection with this, I should make a statement that the operator must understand the cows to be milked.

With the average milking machine, and the average operator, I am inclined to think there is no need of adjusting the length of the stroke. The milking machine manufacturer has given this question special study and knows about what speed of pulsation and what length of relief and suction suits the average cow the best. If an operator who has not made a special study of the cows and machine milking, tries to change the length of the stroke of the pulsator, he may make such changes as will be injurious to the cow and to the work of the machine. With an expert milker, undoubtedly changing of length of pulsation stroke on the different cows is advantageous; but with the average operator it is not any advantage, and it may even prove to be injurious.

C. LARSEN.

South Dakota College of Agriculture.

Developing Dairy Heifers

Speaking of handling dairy heifers, Levi B. Smith, of Miami County, Kansas, has said a good deal in a few words: "The Kansas dairymen had better put out of mind the old notion that the really good dairy cow is an accident. Heifers allowed to shift for themselves on barren pastures and frozen stalk fields cannot be expected to reach their highest development. Every man knows that if he expects his son or daughter to reach their full possibilities as a man or a woman, great care must be taken. So it is with heifers. If we hope for a fully developed cow, a cow that will be a source of profit and a pleasure to handle, we must be generous with the heifer during her growing period."

The three main factors in developing dairy heifers are the care and feed they receive and the age at which they are bred. To develop to the highest degree whatever capacity for growth, stamina, and milk production they have inherited, they must be well fed and cared for and bred to calve at a suitable age. That is, their environment must support their inheritance. As an experienced Kansas dairyman has said, "The fool notion that a heifer should be hardened by exposure and scant rations should not be tolerated."

Preparing to Build

For four years and over I have farmed, milked cows, and sold cream, with no shelter for stock except framework covered on top and sides with straw or hay and with boards on south front.

I will have $400 or $500 to spend on building this fall. I want to start a barn that will be a good shelter for the present and can be modernized later without any expensive changes. I am 14 miles from the railroad where I have to get all lumber, cement, etc. I have an unlimited quantity of stone, which have been or can yet be picked up off my fields or the still unbroken prairie. Sand and gravel are available at a pit six miles away.

I am thinking of building a stone basement barn with quarters for stock in the basement. Perhaps I cannot shelter all my stock for the money I can now spend. How deep in ground must basement be, etc., to make barn warm enough for the use of milking machines?

I do not expect to build now room for all the hay but just enough to hold a few loads at a time.

Oneida, S. D. R. H. B.

When building at this time you are using good judgment in laying plans for the future. With the amount of money available at present, a good foundation should be provided for the future barn and the stable walls be made strong enough to carry the load when the hay storage is built above.

It is suggested that the width of the barn be made not less than 30 feet inside and the sides and one end be made permanent. One end should be constructed so that it can be readily removed when the barn is made larger.

Just how much can be built for $500 will depend partly upon how much of the labor you can furnish yourself. It is suggested that you have a talk with some contractor after you have decided in a general way what you would like to build at this time. When you have told him the amount of material and labor you are in position to furnish, he can make an estimate, which will decide whether you can build what you have in mind or must cut down.

With the stone and gravel available, a concrete wall for stable would no doubt be the most economical construction. When building, stones can be thrown in with the concrete when it is poured which will reduce the amount of concrete required and of course reduce the cost.

The only objection to concrete for stable walls is that it will frost more readily than wood construction. In order to make concrete walls warmer, many dairymen place wood sheathing on the inside.

If the barn is built into the bank, it is advisable to leave room for small windows on the bank side.

With the barn filled with stock, it should be warm enough for the use of milking machines.

Wisconsin. A. G. CRERAR.

Inbreeding and Line-breeding

Would it be possible to give in plain language a brief outline of the system of line-breeding used in general and to tell where the dividing line between line-breeding and inbreeding really is? If it is possible to use a bull on his dam, why not use him on his daughters? What could be expected as a result? Would it be dangerous for the cows in case of abnormal calves? Or, if normal, could anything be expected of such heifer calves if raised to maturity? I am asking this for the benefit of the small dairyman who has an unusually good pure-bred bull, a small herd of good producing grade cows, and who feels that he cannot afford to feed two bulls.

Ashland, Wis. P. C.

Inbreeding is the term applied to the practice of mating closely related individuals such as brother and sister, sire to daughter, or son to dam. It is generally considered that an individual is inbred when its parents show fifty per cent or more common ancestry in the pedigree.

Line-breeding is the term applied to the practice of mating less closely related animals than is practiced in inbreeding. An individual whose parents contain 25 to 50 per cent of common ancestry is considered to be line-bred.

Out-crossing is the practice of mating entirely unrelated individuals or those having less than 25 per cent of common ancestry.

The primary purpose of inbreeding is to fix or intensify certain desirable hereditary qualities or characters so that these will be more consistently transmitted from parents to offspring. The fixing of type and characters is more quickly accomplished through inbreeding than in any other manner. The path traveled in inbreeding to fix certain desirable characters such as tendency to high milk yield, high butterfat percentage, size, physical breed type, vigor, fertility, etc., is beset with certain dangers. Undesirable characters such as a tendency to sterility, lack of vigor, low milk yield, low butterfat percentage, especially if present in both the male and female hereditary make-up, are fixed in the offspring to the same degree as are the more desirable characters. The problem then is to know how to intensify the desirable characters without carrying along the undesirable and dangerous characters. It, therefore, follows that the practice of inbreeding must also be accompanied by the art of skillful selection. Skillful selection embodies not only the ability to choose animals for mating that possess outstanding desirable characters but also the ability and courage to eliminate from the breeding operations those individuals that show a tendency to possess undesirable characters. We used the word courage because rigid discipline has a place in the successful practice of inbreeding.

It is generally considered that the practice of line-breeding is not accompanied with so great a danger of carrying along and fixing the undesirable characters as is found in inbreeding, especially when the latter practice is by an unskilled breeder lacking the qualities of close observation and discipline in selecting the breeding animals. Line-breeding is the most popular practice especially in certain breeds.

History seems to support a frequent use of inbreeding practice early in the development of different breeds of cattle to establish and fix general type and breed characters. This is especially true in the Shorthorn, Hereford, and Angus breeds of beef cattle.

At the present time one can find from the different breed registries individuals from the three (inbreeding, line-breeding, out-crossing) systems that are prepotent for the desired characters of refined type and milk yield.

The primary purpose of inbreeding is to eliminate from the hereditary characters as rapidly as possible undesirable characters and at the same time to combine helpful and desirable characters. In other words, it means to purify the hereditary make-up of the individuals in a herd for desirable characters so that there is a greater degree of certainty that offspring will be better or equal to their parents.

Finally, in answering your question, we would say that inbreeding in its generally accepted meaning is a good practice in improving dairy cattle if: (1) the animals with which you start all possess to a fairly good degree those characters desirable in dairy cattle; namely, vigor, fertility, tendency to high milk yield, tendency to high butterfat percentage, size, and general breed characters; (2) the owner possesses some ability in the art of close observation and skillful selection and mating; (3) the owner can discipline himself enough to have the courage to eliminate from the breeding operations those animals that look nice but otherwise do not measure up to the requirements of improved dairy cattle.

Growing Sweet Clover

How and when should sweet clover be sown? Should it be mixed with other grass seed? What winter dressing should be used to keep it from winterkilling? How many years will it last for hay and how many crops can be cut in one season? How tall will it grow?

Colby, Wis. J. J. S.

We believe you will have the best success in Wisconsin by seeding biennial white sweet clover at the rate of 10 lbs. per acre with the usual seeding of grain in the spring. It is seeded in the same manner as red clover is seeded with grain. We do not ordinarily advise a mixture with other grasses. Secure what is known as scarified seed, and also the proper inoculating material. It will not be necessary to put on any winter dressing, although if the land is of poor fertility a light dressing of manure will be helpful if applied in the fall of the year after the sweet clover was sown the preceding spring.

Sweet clover will last for two years only and then needs to be reseeded. Under average conditions it should give pasture in the fall of the year that it is seeded and the next year should give pasture up until late summer, or until the new seeding of sweet clover comes on. In some cases it is possible to cut a small crop of hay the first year when the sweet clover is not pastured. The next year it will make its largest growth and one or two cuttings of hay may be secured. However, the second year sweet clover is inclined to grow very rank and, although a number of men have found it desirable as a hay crop, we feel that its greatest value is as pasture and as a green manure crop to plow under. If not cut and the season is favorable, sweet clover should attain a height of 2 to 3 feet the fall of the first year. The second year it will grow very coarse and tall if not cut early, but the second crop will be somewhat finer as a rule. The first crop of the second year should be cut to leave a stubble of 4 or more inches, otherwise the cutting will kill out the stand and there will be no second crop.

No Udder No Cow

The maintenance of healthy cows with normal udders is of vital importance to the dairy industry. A cow that is healthy in every other respect, but has a diseased or non-producing udder, is worthless in a dairy herd. The prevention and treatment of the diseases which bring about this condition are discussed in Farmers' Bulletin No. 1422, U. S. Department of Agriculture. The limitations of a bulletin of this kind preclude anything more than a brief discussion of each disease and a suggested line of simple treatment adapted to the means and condition of the average dairyman.

A fundamental axiom of horse husbandry is well expressed in the statement "A horse is no better than his four feet." Translated into terms of dairy husbandry, it would sound much like this: "A dairy cow is no better than her udder."

Implied or expressed, this rule largely governs the desirability of animals considered for a dairy herd, or the fitness of any animal to remain in the herd. The attention of the stock judge is focused on the udder conformation as a guide to a cows' excellence, and the dairyman ultimately rates her value to him according to the evidence of the milk sheets and the butterfat test.

The dairy cow's udder is an abnormally developed gland, the result of centuries of careful selective breeding. It is complex in its physiology. Functioning as it does, under high tension, for maximum milk production during most of the adult life of the cow, this marvelous structure is subjected to a very great physical strain, with small opportunity for rest or repair. The extra tax on the udder which is involved in the birth of calves and shortly thereafter often counterbalances the rest allowed between milking periods.

We know that thousands of dairymen will appreciate having this bulletin for study and to file in their library. Write to the U. S. Department of Agriculture for Farmers' Bulletin No. 1422.

The annual meeting of the National Dairy Association is called for Friday, December 5th, at 10:00 a. m., at the Auditorium Hotel, Michigan Avenue, Chicago.—W. E. SKINNER, Sec'y.

Extension Workers At Cornell

H. H. LYON, NEW YORK

EACH year in late fall extension workers of New York State gather at the State College of Agriculture at Cornell together with the Farm Bureau and Home Bureau agents and Junior Project leaders for a week of conferences. A great amount of information is presented at these conferences and the one in late October this year was no exception.

The president of the State Federation of Farm Bureaus congratulated the county agents on the unity of purpose of the various agents, the State College, and the State Department of Agriculture. He spoke particularly of T. B. work and expressed satisfaction respecting the progress it has made. It is true that the bureau federation work has been curtailed somewhat for lack of funds. Agent work, however, has reached more than ever. Then Mr. Lee thinks that half of the service rendered has been for non-members. Reforestation has made very satisfactory progress. The membership in farm bureaus of New York has not increased as much as might be desired, but it is believed to be now on a sound foundation and will grow.

Tuberculosis Eradication

We of New York feel much encouraged in respect to reduction of bovine tuberculosis. Commissioner Norgord spoke of this work and is enthusiastic over the progress made in a year. A year ago there was misunderstanding, but this is now past. County agents are working cordially. The veterinarians are under careful supervision. Combined tests are necessary. Two forms of tests ought to be applied at one time and in some cases all three should be. Disinfection should follow quickly and it is necessary that the veterinarian be on hand. A delay of a week or two will not answer. Again let all the various papers needed come along at the one time, otherwise the claim has to be sidetracked and thereby delayed.

Higher salvage value is being obtained than formerly. Three years ago it was $14.20 per animal and it has been increased yearly until now it is $19. On the other hand, state money is now saved. Formerly the average state indemnity was $76 and now it has dropped to $50. Then all new testing is on an area basis. One county, Essex, stands accredited as a county and Steuben is expected to be by December fifteenth. Mr. Norgord urges that new additions to any herd should be good animals.

Commissioner Pyrke continued the discussion and said that the conditions are a hundred per cent better than a year ago. Now the work is really under control. About 5,000 reactors are tested out each month at this time. The work slows up in bad weather, and the state is paying only two and a half million this year. An appropriation of four millions is asked for from the next session and Mr. Wetter, who is chairman of the agricultural committee, remarked that he believes it will be made. There is no deficiency appropriation asked for this time which is the first instance of the kind for some years.

Price Levels

Conditions are such now that the price level is most likely to go somewhat higher next spring than at the present time, remarked Dr. G. F. Warren in his second address at the conference. There are little waves in the price level but there are also curves over a longer period. If we can tell the average price level we can usually tell pretty nearly what will be the price of various commodities although all commodities do not vary to the same degree nor at the same exact time. Gold changes greatly in value from time to time. The general trend of gold prices is now upwards which means that the longer curve of prices will be downward.

Numerous charts were shown to make clear various changes and present prices. One chart presented the difference between union labor and farm prices as compared with prewar prices, the former being at about 220 per cent while the latter for the United States is 137 per cent of the pre-war. The trend of prices of hogs, horses, beef cattle, etc., was shown. Hogs are most likely to go up probably next year. Horses will later advance and it is a good plan to discard the old horses this fall and buy good, young horses at $50 to $75 to be kept for some years as they are likely to be higher before many years. Beef cattle may delay six years or so before being particularly high. Butter is now relatively high and may decline for a time with short changes both ways. Butter affects the price of milk. It is much easier to transport butter from Minnesota to New York than the grain necessary to produce that amount of butter. There will be better returns for the dairy in time, for cities are growing and milk consumption is on the increase. There may be some hunting for milk in five or six years.

Co-operation

Dr. O. B. Jesness of Kentucky spoke on co-operative marketing. He regards the farmer as not at all lacking in business sense. He does well in directing his co-operative associations. People frequently speak of farmers as individualistic, but the speaker thinks that if one were to start out to bring together into a buying association the owners of many corner groceries he might find them individualistic, too. The U. S. Steel Corporation and the Dairymen's League are different. The former is engaged in producing at one point. The League, as such, is not producing although its members are, but is doing the marketing only.

Co-operatives cannot control prices. There is a difference between fixing prices and influencing prices. Prices may be influenced by quality, grading, storing, and advertising. Better and more experienced salesmanship may be had than individual farmers generally can supply by themselves. Speaking of the federated type and the centralized type, the speaker did not seem to have any particular preference. He thought the commodity might sometimes determine this. In the federated type there may be the local pool, but he thought it possible to have the local pool, if desired, in a centralized association.

The Dairymen's League

The Dairymen's League is regarded as the most important co-operative association in New York State and possibly in the country. Since it is important and has presumably the strongest enemies, or perhaps because of its importance it has the strongest enemies, it received the most lively attention of any discussed at the conference. Paul Smith, a director and member of the executive committee, gave out the most of the information. There was a question raised as to the advisability of the League selling on the "platform". Mr. Smith held that sales on the platform by the League do not materially compete with the dealers who regularly buy class one milk from the association. They have their regular platform customers. Practically all the independent co-operatives sell platform milk.

To counteract any tendency towards an unusual withdrawal it is proposed to acquaint members with the accomplishments of the association. Three men have been delegated to go out on this work and have been at it now for a short time. They are each to spend about three months in the work. It is not the expectation nor has it been, explained Mr. Smith, to fix an excessive price on milk, but it was the hope to make the fluid price equal the cost of production plus a reasonable profit. This he holds might now be done were it not for the competition of those outside the organization. Cream has some competition from the West and butter, cheese, and condensed milk have nearly a world competition. A chart was presented showing that the price of milk has been considerably higher in relation to butter and cheese since the League organization was formed than before.

One of the disadvantages has been that some large expensive plants have had to be operated partly as condensing plants and partly as shipping. This changing has cost considerable money. In some cases increased volume of milk at a particular plant would lower costs of handling. Evaporating plants ought to be located further out and as far as possible all fluid milk supplied from nearer the city. The plants, however, within the last two years have been brought up to a high standard of working efficiency which is a remarkable achievement for so short a time.

A question came up as to whether experienced business men should not be brought into direct business affairs or at least counsel. Mr. Smith replied that bankers are frequently consulted and others if possible, but that a business man must have long experience with the co-operative before he can grasp the real situation and in many cases it cannot be brought about. It is necessary that the management be familiar with farm affairs and conditions.

Of course, it is known to all who study the situation, as the speaker explained, that the League can never get the price to its members that the outside dealer pays because the outside dealer has practically no surplus to care for. The non-pool buyer has no stable price for all localities but pays much less where there is no organization in competition. Also he does not give out his prices and there is no way to make comparisons. Then contrary to the usual opinion it was held that the spread between what the outside dealer pays and what the organization can pay is not the greatest cause of dissatisfaction but rather the present economic conditions.

Considerable discussions went on relative to the employment of a general manager rather than leave the management in the hands of a committee of five known as the executive committee. The speaker is for a continuance by the committee. There are ten department heads who are expert in their lines and each member of the executive committee has direct charge of two of these. This brings the membership, he says, more closely in control of operations.

Wisconsin Dairymen's Association

THE annual meeting of the Wisconsin Dairymen's Association was held at Madison on November 6 in conjunction with the annual meeting of the county agents, cow testers, and farm institute lecturers. With this type of meeting the lessons to be learned can best be carried to every section of the state.

The educational part of the program was largely devoted to a discussion of summer feeding of dairy cows, with special stress on sweet clover for pasture. Professor W. J. Fraser opened the discussion with an address on "Ever Failing And Never Failing Pastures". He showed slides illustrating blue grass and sweet clover pastures and he kept the attention of his hearers. The vital interest in this subject was well shown by the many questions put to the speaker as to how to get a stand of sweet clover, how to handle it, and what its uses were other than as pasture and green manure. He was full of information and many of his hearers got a new understanding of the vital importance of summer pasture.

Professor Fraser drew attention to the long period when pastures are relied on for feeding dairy cows and how blue grass pastures frequently supply only a portion of the feed actually needed. He said he had figured out that it would require a dairy cow with a mouth two feet wide and going at the rate of 18 miles a day to get enough feed from blue grass pasture at certain periods of the summer. He said the first stomach of the cow was a seven-bushel storage for feed that the cow should be allowed to fill quickly and then lie down to chew if she were to produce milk. This she can and does do when on sweet clover.

The address of Mr. Fraser followed along the general line of his series of articles in Hoard's Dairyman, but was interspersed with illustrations and epigrammatic statements reinforcing his general argument. He told how one man asked him if sweet clover did not have a narcotic in it, because his cows laid down so much. The reply was, "They lie down to digest the feed they were able to secure in big bites of sweet clover whereas on blue grass in August they were kept on their feet trying to get small mouthfuls of grass."

In the discussion following this address, Wisconsin men told of their experiences with sweet clover. Mr. Palmer reported that he had pastured sweet clover for six years and had found it very satisfactory. He has never been troubled with bloat. To secure good fall feed, he seeds with grain as a nurse crop, a mixture of 6 lbs. sweet clover, 2 lbs. alsike, 2 lbs. red clover, and 2 lbs. timothy. Emphasis was given to the fact that sweet clover needs a sweet soil just as alfalfa does. Also that sweet clover seems to be best adapted to pasture and green manure, although some reported success as hay and silage. There is a danger, however, in moldy sweet clover hay or silage.

Professor George C. Humphrey discussed the value of summer silage as insurance against pasture failure. He gave a number of instances of farmers who were making profitable use of silos with a minimum of pasture.

Professor Mortimer discussed emergency crops, with special reference to oats and peas, recommending that Wisconsin green field peas or Scotch green peas with medium late oats give the best yields. He also reported that Sudan grass had been found superior to millet in yield and palatability. Sudan sown at the rate of 20 lbs. per acre will make good pasture, but should not be pastured until one to two feet tall. A mixture of 10 lbs. Sudan and 1½ bushels soy beans will give hay containing about 1-3 soy beans.

Professor Morrison discussed the need of efficient cows well fed when feeds are high in price. Failure to feed good cows well is false economy. We shall reproduce his paper in an early issue. The discussion by R. A. Kolb and C. H. Imig emphasized the necessity of culling out the poor cows and feeding well if profit is to be secured. Mr. Imig introduced a problem of breeding when he drew attention to the desirability of securing sires that will at least maintain the average fat per cent for the breed. He depreciated the selection of a bull from the phenomenal cow, preferring to secure his sire from a family of good producers.

The relation of prices of dairy cattle to prices of dairy products was discussed by F. G. Swoboda, A. O. Collentine, W. J. Rogan, and Milton Button. Some of the speakers believed that there was a very definite relation, while others held that the price of dairy products influenced demand but it was difficult to assess any direct ratio between the rise or fall in price of cheese and a similar rise or fall in price of cows.

There was considerable discussion of the possibility of promoting cow testing associations on a plan whereby the cost would be less, at the same time retaining the present type of associations. There was no suggestion as to how successful associations of this type could be organized and it was finally decided to leave the matter with instruction to a committee to investigate and report at a later date.

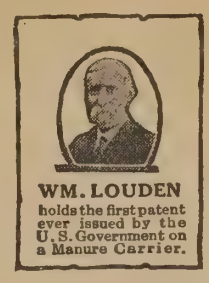
The following officers were elected for the ensuing year: President, H. F. Schroeder of West Bend; vice-president, D. P. Hughes of Menomonie; secretary, Paul C. Burchard of Fort Atkinson. The following resolutions were adopted:

WHEREAS, The dairy products of Wisconsin are meeting each year greater competition from foreign countries, such as Denmark, New Zealand, Australia, and Argentine; and,

WHEREAS, These countries are devoting much effort in producing high quality dairy products; therefore, be it

Resolved, That we, the members of the Wisconsin Dairymen's Association, in annual convention, urge our dairy farmers and the manufacturers of dairy products to devote more effort to the production of quality as the most effective means of meeting this competition;

Resolved, That one of the most outstanding lessons of cow testing association work is its determination of the poor cow, revealing to her owner that he cannot gain any profit from her, and the consequent necessity of her elimination;



Resolved, That we urge the closest and most hearty co-operation between all the various branches of dairying in the development of our industry.

WHEREAS, We need to encourage the production of not more but better cows; and as these better cows are nearly always daughters of good sires and as many of the low producing cows are daughters of poorly bred bulls; therefore, be it

Resolved, That we encourage a more liberal use of the best dairy sires in our cow testing associations by awarding the owners of the bulls having the five highest average producing daughters, according to their age, some suitable certificate of merit.

Carnation Cow Produces 1,000 Lbs. Fat

Nooksack Lunde Oregon De Kol, one of the good cows in the Carnation Stock Farms' herd, recently finished a year's record of 34,510.9 lbs. milk containing 1,088.2 lbs. butterfat (1,360.26 lbs. of butter). This record makes her the 88th Holstein to cross the 1,000-lb. mark and gives her 19th place among the butterfat producers of the breed.

The Meanest Farm Job Made Easy

Cleaning out the barn! How you would like to cut out that back-breaking job! You can. Install a Louden Manure Carrier. No more heavy lifting and shoving of wheel-barrow load after wheel-barrow load out onto the manure pile, for the Louden takes the equal of 5 wheel-barrow loads at one trip—takes it clean without dripping and scattering.

And while this big, easy-lifting, easy-running manure carrier is taking the dull monotony and hard work out of barn cleaning it is saving half the time.

Easy to Install in Any Barn

Whether your barn is new or old you can install a Louden Manure Carrier and use it to *profitable* advantage. It is one of the biggest time savers you can put on the place. And, because it takes the meanness out of barn cleaning, you have less trouble keeping the hired help or your boys on the farm.

All corners of the Louden Manure Carrier tub are soldered—water tight. Ends and sides are welded to the steel frame—not riveted. Load is suspended squarely under track—no side buckle. These are but a few of the reasons why so many Louden Carriers are still giving daily satisfactory service after 20 years or more of hard usage.

Write today for full details with illustrations on this famous Louden Manure Carrier. No obligation at all. Check the coupon now.

Louden Steel Stalls and Stanchions give cows pasture comfort in the barn. *Water Bowls* increase the milk flow. *Manger Divisions, Cupolas, Bull Staff, Hay Unloading Tools, Barn and Garage Door Hangers, Hog House Equipment,* "*Everything for the Barn.*" Write for information on any of these.

Get Barn Plan Book—112 pages of practical facts that save money on barn building or remodeling. Illustrates 50 barns with floor plans. Check and mail coupon today.

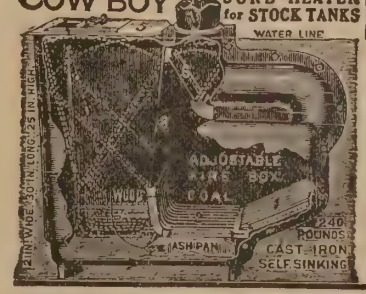
Straining Through Dirt is not Sanitary



Use a BORDEN STRAINER AND FILTER

Strains and filters the milk and removes all contaminating dirt and sediment, thus promoting the keeping qualities of the milk. Easy to keep sweet and clean. Weight 6 lbs.; fits any standard size can. Send your name and address. When postman delivers give him $2.00 plus few cents for postage. Money returned if not satisfied at the end of 10 days.

COW BOY SURE HEATER for STOCK TANKS

KEEP COWS HEALTHY

Illinois State Experiments show that 85% of Cows kept in Close Warm Barns tested Tubercular. Prevent this by keeping water tank in open barnyard equipped with a Self-Sinking

COW BOY TANK HEATER Saves Money Every Week

Turn cows out of barn to drink in Fresh Air and Warm Water. "Better drink from a Large Tank than from a Small Bowl." Burns coal, cobs or wood. Outlasts all others. Durable, practical, reliable. Quickest to heat; strongest draft; ashes removed with no check to fire; adjustable grates; keeps fire 24 hours. ABSOLUTELY SAFE. Warm water helps digestion; saves grain.

"Purchased 3 of your Tank Heaters last winter, worked very satisfactorily and are well worth their cost. Every stockman should use one." W. H. PEW, Prof. of Animal Husbandry, Iowa State College, Ames, Ia.

When Writing to Advertisers, Please Mention Hoard's Dairyman

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

Wants Reason for Single Tax

HOARD'S DAIRYMAN:—Mr. McKnight says, "God gave the land to all his children". Hence it appears he thinks those who live on the land should pay all the tax. Who is his authority? Who are God's children? If the Japs are, Mr. McKnight should write to President Coolidge and let him know it for then the Japs have as much right to the U. S. A. as Americans.

Was it only land that God gave men? If God gave land He gave everything else. The laborer was given the ability to produce and to think by nature also. You see no reason why he should be taxed for it. The only difference is that his power to labor and think was a direct gift while the land was taken from the beasts of the field or a preceding race.

Mr. McKnight does not misstate facts. He ignores them altogether and expects us to swallow all his theories whatever he advocates. Why? The reason why is because Mr. McKnight sees no reason why men should be taxed for (improvements on land), buildings, etc. Yet he would tax land for its fertility, its ability to produce (with man's aid) another improvement. He should read Hoard's Dairyman on soil fertility. Evidently "he has not taken the time to inform himself". Land is made productive not by men living on it but by those improving it. It is not his presence but his ability to produce and use land that makes it valuable. Land, labor, and brains are not wealth but the ability to produce usable material from each is. Show one reason why one source of wealth should bear all the tax. Our fundamental law is not to tax just one source of wealth, one form of improvement, but all wealth equally (on the free and equal basis). Progressive thought is not to make taxes less just but more equitable. Progressively increasing income tax is the modern idea, letting those most able to carry the load be burdened according to their ability to carry it. I work at carpentering and farming. Why should I be taxed for improving the land fertility and not for building on it?

I would like to hear from some one in these columns who believes in single tax and can produce a few reasons. I am from Missouri when it comes to single tax and arguments such as Mr. McKnight's do not satisfy me for he simply states in effect the reason why is because.

Michigan. RALPH W. STEED.

A Motto For Single Taxers

HOARD'S DAIRYMAN:—As I understand Mr. Oliver McKnight's article in your issue of Oct. 31st, he claims "God is behind this single tax movement." I remember when a boy that a politician was running for office on the Prohibition ticket. He had held office under every party that had been before the public for many years previously and as each party kicked him out he espoused the cause of another. He ended his campaign oratory on each appearance in his last role with the declaration, "God is behind this movement".

The people, however, saw the cloven foot and trounced him plenty. Have noticed that when acquaintances of mine had no property they favored single tax but later as they became possessed with real estate they cooled off and turned against it. There is no feasible way for the state to become possessed with title to all real estate but the Russian way and when those on the land are required to pay all expenses of government, will it not work here as it has in Russia, viz.: Those on the land lay down on the job and the people go hungry as they are now doing in Russia? People must have some incentive or reward for toil or they will resort to sabotage.

It is nonsense to claim that those who toil would not pay larger taxes proportionately than the rich because they do under our present system. Investigation shows that the farmers in Minnesota are paying about two-thirds of our taxes and under your system they must pay two-thirds of the one-third in addition to what they now pay. In cities one can buy a building lot on graded streets with water and gas for from $100 to $500, so the lot cuts a small figure in the cost of a home. Investigation shows that taxes now take 70 per cent of our rental income on the average. Why is not 70 per cent enough to satisfy the greed of even a single taxer?

The single taxers make claims that remind me of the motto I have seen on sticking plaster packages, viz.: "I heal all ills save those of love".

Minnesota. H.

Want Efficient Service From Railroads

HOARD'S DAIRYMAN:—I had no desire to open a railroad debate in offering my article of Aug. 22. Mr. Charles Dillon of Illinois has taken exception to my statement that the railroads are guaranteed a profit. If he will concede that the present transportation act is a paternalistic measure he and I are of the same mind.

Every student of railroad affairs has come to realize that our railroads with a few notable exceptions are financial intermediaries. On account of the great consuming ability of the railroad for coal, iron, steel, and lumber, as well as repairs, construction, and high salaries they constitute today the most gigantic grab bag we have for exploitation by the purveyors of above mentioned commodities.

Our congress authorized the fixing of a rate which would take from our people a desired sum for this grab bag. My use of the guarantee of profit was loosely made, I admit, but I was not in a railroad discussion and my use of the term was as good as any for the purpose intended. I would now ask Mr. Dillon if he does not think it advisable to repeal the present transportation act since it shoulders such a gigantic loss upon the railroads. My position is that since we have these paternalistic measures enacted for the benefit and at the instigation of private interests in our country, we should either take in every industry including farming or take it all away since it does plainly operate for the aggrandizement of some and to the detriment of many as it stands today. We of the common farming class don't care a rap whether the railroad is operated as an intermediary or as an individual unit as long as it serves us efficiently. The most of us don't want it in government hands but we do want an even break with the railroads and all other interests. Let's have it all paternal or none.

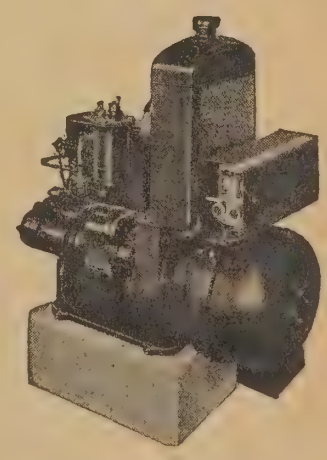
Minnesota. HOWARD KIMBLE.

Three years of continuous service —80 cents for repairs

"I TAKE pleasure in certifying to my complete satisfaction with the Kohler Power Plant after nearly three years of continuous service. During that time I have purchased only 80 cents' worth of repairs, caused by my dropping a part while cleaning it.

"The Kohler has enabled me to do the same amount of work with less hired help. Doing away with batteries, the economy of space and upkeep, and the low consumption of gas I consider its main features. Automatic operation saves many steps and lots of time."

[*Signed*] Geo. W. Gregg,
Garrison, North Dakota.



THREE years of enjoyment of every electrical convenience, and only 80 cents spent for repairs—that is a record which only a very fine machine could make possible.

But the Kohler Automatic Power and Light Plant has made many such records. In the hands of thousands of owners, over a period of several years, it has been piling up proofs of unmatched ability, dependability, and economy.

As every Kohler Automatic owner knows, this successful unit marks a revolutionary advance in lighting plant development. *It has eliminated the storage battery* (except a small starting battery). It stands always ready to deliver its full current capacity—an all-important advantage to the power user.

It generates 110-volt current, insuring brilliant light, operating standard appliances, and reaching distant buildings with minimum wiring expense. Its fully automatic operation saves trips to the plant when power appliances are used.

If you want to get the most out of electricity, you owe it to yourself to find out what the Kohler Automatic is doing for others. The evidence is in the Kohler Automatic booklet. And the coupon below will bring it to your letter box.

National Milk Producers Meet

THE program for the eighth annual convention of the National Co-operative Milk Producers' Federation, held at Detroit, Mich., November 14—15, consisted of talks and reports by representatives of several large co-operative agencies together with a representative of the U. S. Dairy Bureau. Important points brought out by the several speakers are as follows:

Charles W. Holman, secretary of the federation, paid particular attention to the flexible tariff provision of the Tariff Act. He believes the provision is a miserable failure and that the numerous tariff investigations have resulted in confusion, uncertainty, nervous market conditions, and great expense. He believes the "cost of production" theory upon which the flexible tariff provision rests could better be replaced with "common sense". Mr. Holman pointed out that the way in which the Tariff Commission determines the "principal country of competition" is not sound in all cases and cited as an illustration that New Zealand, Australia, and Argentina may be a greater menace than Denmark, the country selected by the Commission.

According to Mr. Holman's report, the farmer membership in the federation has increased by 80,000 through the addition of co-operative marketing associations and now stands at approximately 300,000 members.

⚜

Dr. C. W. Larson, chief of the U. S. Bureau of Dairying, talked principally concerning the international aspects of the production and distribution of dairy products. He pictured the dairy industry in this country in terms of its enormous growth during the past 50 years, in terms of production and consumption, in terms of exports and imports, and in terms of the effect of the probable expansion of dairying especially in certain countries of the southern hemisphere.

The peak of our expansion, so far as exports are concerned, came in 1919 when it took two and three-quarters billion pounds of milk to make the products that were exported that year. The ending of the war and the consequent lack of credit on the part of our foreign outlet stopped this large export.

The farmer has been urged to control production but it must be remembered that there are many factors involved in quantity control in a particular year that may not be controlled.

Dr. Larson pointed out that too often the price on our entire production is influenced by the ability and desire of foreign countries to buy these products. This applies more especially in times of surplus production. Our chief concern is to hold production, in so far as is possible, at such point as will enable us to escape the demoralizing effect that comes with large exportable surpluses in which case foreign desire for and ability to pay for our dairy products very nearly sets the price on our home consumed products.

At the present time we are exporting about the same quantity of butter as before the war. Denmark has expanded her export trade. New Zealand, Australia, and Argentina are increasing their production. Germany, normally a heavy importer of butter, is gradually but slowly coming into the market.

⚜

George W. Slocum, president of the Dairymen's League Co-operative Association, told those who attended the convention that the success of the League was due to the individual responsibility which each member has voluntarily assumed from the beginning.

An outstanding feature in League activities during the past year has been the expanding of the fluid milk market. The total quantity of milk pooled and sold annually is around 2,675,000,000 pounds. An educational program has brought about a better understanding of market problems. The success, in considerable degree, depends on reaching the individual member with a clearer understanding of the policies, business, and merchandizing movements of the association.

Membership in the League reaches farther than the co-operative selling of dairy products. It enables the dairy producers to exert collective action on important legislative problems, etc.

Farmers have so much in common that the League policy has been to co-operate with other farmers' organizations, such as the grange and farm bureau.

It is the opinion of Mr. Slocum that the educational work carried on by the League among consumers has been very valuable and is especially important at times when it is necessary for farmers to raise the price of their product.

Some important changes have been made during the past year in the general management of the League's affairs. The change has been from a general manager to that of departmental control by twelve separate and distinct heads, each under a specialist who are in turn directly responsible to the farmer-elected officials which in this case is an executive committee of five men who carry the authority of the board of directors when they are not in session.

It is quite a problem to broaden the vision of each individual member so that he grasps the entire problem. It takes many sacrifices to start and maintain an association of this nature and size. The individual member is inclined to discard these values, intangible as they are, in his measure of the success and service of the association.

The League's credit system has saved dairymen many losses that otherwise would have come due to the failure of distributing agencies.

The League now operates 150 plants which are well located with respect to serving members. In addition, the League operates twelve manufacturing plants. The "Dairylea" brand of condensed and evaporated milk has the greatest factory output value, ice cream is next, then butter, then cheese.

As to quality of milk, 90 per cent of League dairymen pass the New York City regulations. Quality control is being looked after in a splendid way by veterinarians and sanitary inspectors.

"Dairylea" brand of League products is now on 12,000 of a possible 15,000 New York City retail accounts. These products are selling in Germany, England, South Africa, Panama, Cuba, Palestine, Syria, Bermuda, Jamaica, and Peru.

On March 31, the membership in the League was 68,838 individual contracts. After deducting requests for cancellation and adding the new contracts, the League membership is 67,227. The finances are in good shape. The confidence of the membership is shown by the fact than an offer by the League to take up $1,500,000 of 6 per cent interest bearing certificates met a response to the extent of only $425,000.

Mr. Slocum concluded with the thought of there being much talk about a better plan but thus far no one has offered a better plan.

⚜

Frank G. Swoboda, general manager of the Wisconsin Cheese Producers' Federation, after telling of the size of business measured in terms of products handled and number of assembling plants, gave considerable attention to telling about the federation's efforts to improve the quality of cheese.

The organization represented by Mr. Swoboda handled 154,000,000 pounds of cheese valued at $34,250,000 this past year. The federation controls nine assembling branches, eight of which are in Wisconsin and one in Minnesota. Active brokers are maintained in 50 cities.

The efforts of the federation in pushing its brands of quality cheese have been rewarded with considerable success. Cheese grading has been fairly satisfactory.

The chief difficulties encountered in the efforts to gain a recognition among consumers for quality cheese are: 1, the inclination in certain parts of the trade to buy process cheese; 2, the general tendency to indifference and antagonism from a part of the cheesemakers towards a quality program; 3, the tendency of consumers to consider price rather than quality and to be satisfied with the inferior qualities thereby putting a premium on the poorer cheese.

The federation conducted a quality contest and a cheese factory beauty contest. It has made every effort to win the confidence of the cheesemakers and dealers in the fight for quality.

The majority of farmers think of the Federation only in terms of its ability to pay more and do not value the organization as a competitive faction, as a vigorous champion for quality, and as having a sound merchandizing program.

Mr. Swoboda indicated that little progress can be expected as long as a nation more able to pay continues to give cheese producing dairymen less for their efforts because they in their chosen disorganized condition are actually willing to go on producing more and accepting less in dollars.

⚜

C. Bechthelheimer, secretary of the Iowa Creamery Secretaries' and Managers' Association, confined his remarks briefly to telling what his association is doing to improve the quality of butter, to facilitate more economical transportation and marketing of butter, and to increase consumption of dairy products.

Iowa creamery butter is gaining a reputation for quality as evidenced by the winnings of Iowa buttermakers at the National Dairy Exposition. Twenty-one creameries are now making the "Iowa Brand" butter.

Compulsory pasteurization is being enforced by the Department of Agriculture through the use of recording thermometers, the readings of which must be dated and held until ordered destroyed by the field inspectors.

Thirty to thirty-five consolidated carloads of butter are now going out of Iowa each week. This does not include full carloads sent out by individual creameries.

⚜

W. M. Cease, secretary of the Farmers' Milk Producers' Association of Richmond, Virginia, said that the dairy cow and co-operative enterprise are receiving serious consideration in his section of the South. As evidence that his association has merited some degree of success, Mr. Cease said that in 1916 when the association was organized under difficulty, milk was selling at 20 cents per gallon and 3 cents per pound for butterfat over 3.8 per cent was allowed. In 1924 milk is selling at $3.93 per hundred and 5 cents per pound butterfat over 3.5 per cent is allowed. The educational efforts of the association have been valuable. Thousands of dollars were raised to put on a "Milk for Health" campaign which increased the consumption 41 per cent.

The members of the board of directors take their work seriously and give regular attendance at monthly meetings. The organizers were called dreamers and were scoffed at in 1916.

⚜

I. W. Heaps, secretary of the Maryland State Dairymen's Association, urged that every organization of producers should recognize that production, distribution, and consumption are closely linked together and that failure to study each factor invited failure to the whole enterprise.

Two features of this association are that there is an arbitrator who settles disagreements between producers and distributors and that all testing is done by an independent laboratory. The first feature has proven very satisfactory. The second, likewise, has proven satisfactory and has eliminated adulterated milk.

Farmers' Judging Contest

One hundred thirteen farmers representing seven states took part in the first farmers' judging contest at the National Dairy Exposition this year.

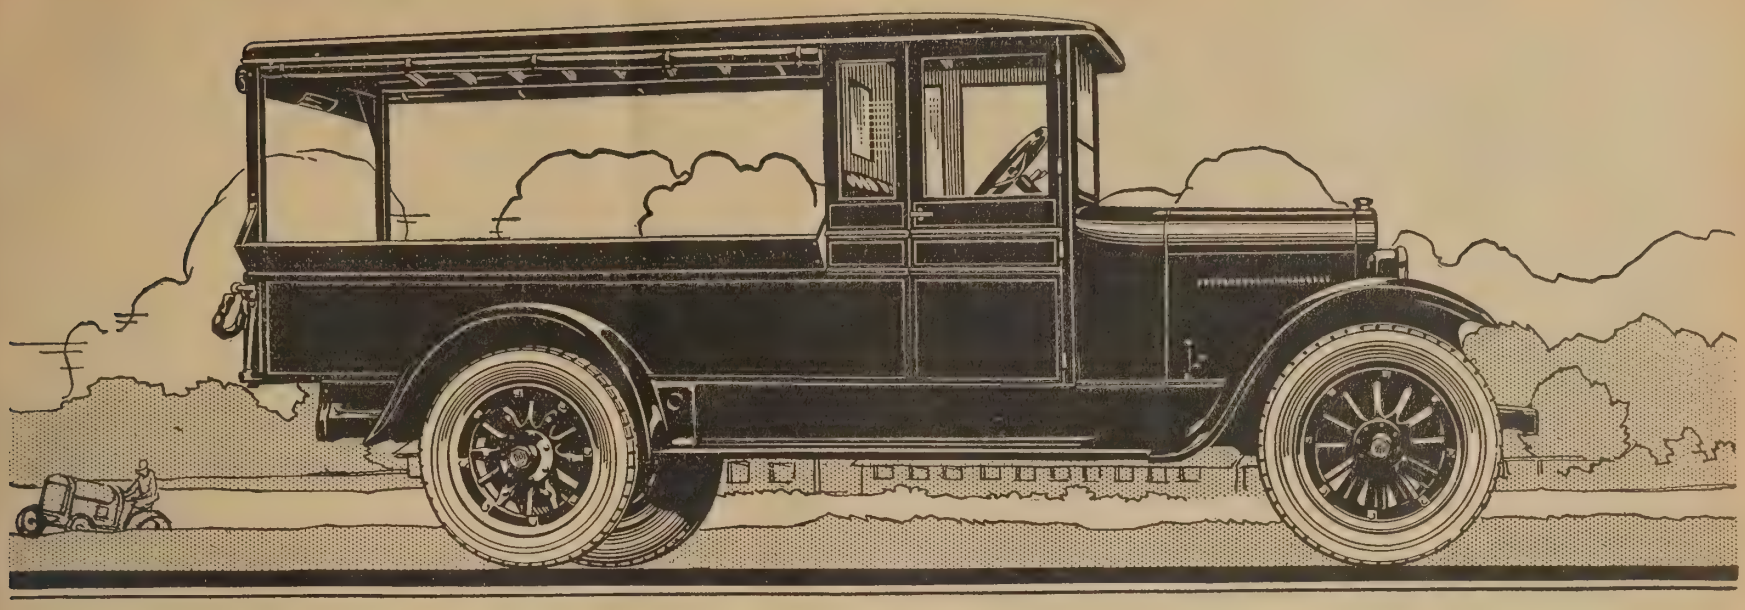
In the judging by teams of three men each, the Iron County Guernsey club team of Michigan, composed of Richard Johnson, Hubert Greeland, and Francis Pelletier, won first; the Mazomanie Holstein Cow Test Association team of Wisconsin, composed of Carl Schumann, Ralph Hodgson, and Alvin Roelke won second; the Richland County Brown Swiss Association team, Wisconsin, composed of D. A. Brace, Herman Schmitz, and Geo. Sary, won third.

The first, second, and third places in high individual scores by breeds were as follows: Holsteins, Chas. Craig, E. P. Sand, and J. N. Nimlos; Guernseys, Chas. Wilkins, Roy A. Atwood, and P. W. Kirkhofer; Jerseys, Walter Ofstedahl, Mrs. Ed. Kirkwood, and J. C. Piper; Ayrshires, Roy Seitz, John Geiger, and Joe Simmons; Brown Swiss, Geo. Kloser, D. A. Brace, and Fred O'Donnel.

Banner for breeder and exhibitor of Guernseys went to W. W. Marsh, Iowa.

Banner for breeder of Holsteins was tied between Minnesota Holstein Company and Hargrove and Arnold, Iowa.

Banner for exhibitor of Holsteins went to Hargrove and Arnold, Iowa.



Banner for breeder and exhibitor of Jerseys went to Twin Oaks Farm, New Jersey.

Banner for breeder and exhibitor in Ayrshires went to Adam Seitz and Son, Wisconsin.

Banner for breeder and exhibitor of Brown Swiss went to The Hull Bros. Co., Ohio.

World Record Two-year-old

Minnesota has just brought out another world's record Holstein in Queen Bess Pietertje Ormsby, bred and owned by C. L. Spaulding. As a senior two-year-old she produced in 365 days 24,587.6 lbs. milk containing 895.63 lbs. fat (1,119.53 lbs. of butter).

What Thanks Shall We Render?

Once upon a time there was an Indian named Squanto who was captured by wicked Spanish traders and was taken to Spain where he was sold as a slave. He suffered miserably while in Spain, because he was not accustomed to the country or the people, and he could not understand their language.

While in this plight, a kind-hearted Englishman found him who redeemed him from slavery and brought him back to his own country. For this favor Squanto was greatly indebted to the colonists and made up his mind he would do something to the early settlers for the Englishman's mercies. So when he visited the American colonies and saw what a hard time they had to keep from starving, he brought them corn and decided to teach them how to plant it.

With the help of chief Samoset, who had learned to speak a few words of English, Squanto soon taught the Pilgrims to plant corn and also taught them some of the Indian methods of game trapping. With the supply of corn that Squanto brought, together with game and fish, the colonists were able to live through the winter. Without the friendship of the Indians, they probably would not have survived.

Therefore we are thankful for the corn!

The next spring the Pilgrims lost no time in planting some of the corn in the way they had been taught by the Indians. When fall came, which was in the year 1621, they harvested their corn and were so glad to be alive and to have a store of food for the winter, that they decided to have a harvest festival.

John Carver, who was then governor of the colonies, proclaimed what was probably the first Thanksgiving Day. One of the writers of that day tells us of the event in the following words:

"Our harvest being gotten in, our governor sent four men on fowling, that we might after a more special manner rejoice together, after we had gathered the fruits of our labors. They four in one day killed as much fowle, as, with a little help besides, served the company almost a week."

It was just about a year ago, said some of the people of the colony, since Squanto taught us how to plant corn, and now we have a store of it for the winter. Let us give thanks for this harvest of corn.

In so far as our harvest is accomplished with less hardship and privation and is so much more bountiful, let us not in the rush of emergencies forget our thanksgiving, but "in thanksgiving let our requests be made known to God".

The earliest festivals after the toil of the harvest were mostly frolics. It was a time of feasting, of sports and trials of skill, of rest and relaxation. It was a day on which people listened to a long thanksgiving sermon and then celebrated at some harvest home.

The association of Thanksgiving Day with the home and the harvest, has grown to be a little obscure. With the farm people, who live more like their colonial ancestors, the day retains more of its old meaning. It is natural at this time of the year, when all the products of the farm are in greatest abundance, that we should fittingly celebrate the rewards of the past year's work.

We enjoy freedom, may worship God as we please, we have fine crops and good prices this year, and we have plenty for the coming winter. A day of thanksgiving for our homes on the soil comes into our year with the same fitness as it did in the day of the colonists, whose life and work were so familiar to our own. On the farm it is truly easy to link thoughts of God, home, and the bounty of nature with thoughts of praise and thanksgiving. Let us then be thankful for our homes on the soil.

In the city it is harder to see that the harvest is so closely bound up with prosperity and plenty. There Thanksgiving Day is generally accepted as a family holiday, or a day for reunions at the old homestead and for renewing old affections. They are so inclined to make "turkey day" a "gobble, gobble day". They, too, should consider the source of the plenty they are enjoying at this season of the year and, I think, might well give thanks for the farmer.—SOPHIA K. ORMOND.

Labor Before Thankfulness

Thanksgiving is here. We are ready for it. The pumpkins and sweet potatoes are in the driest part of the cellar. The apples, pears, potatoes, turnips, carrots, beets, celery and cabbage are all stored in their accustomed places. The canned fruits and vegetables fill up their shelves. The dried stuffs hang in the pantry. How blest we are to be able to grow and store such a wealth of food! In asmuch as the growing of this food and the canning and drying and storing of it represent so much labor, just in that much do we appreciate the meaning of Thanksgiving, the festival of the harvest time. Old Thanksgiving, we have run a race with you. But we are there on time. The silos full, the corn shucked, seed corn saved—all done according to schedule. When the family all come together for the Thanksgiving dinner we'll forget how the silo cutter acted up—forget how cold it was the morning we cut off the sweet potato vines, and how we hustled to can that last dozen quarts of green beans and how near the onions came to being frosted out there in the shed before we finally carried them down cellar. We'll forget all the little hardships and away down deep in our hearts be thankful for food and home and loved ones.

And may we remember that after all, life is much more than meat. Hours and hours through the summer months we spent preparing the food to sustain life and for our success we are thankful. Let us count hours better spent that we give to the betterment of life itself.—SALLIE RURANE.

Thanksgiving Dinner

Maybe you have not yet planned your Thanksgiving dinner and will be glad for a few suggestions. Of course you won't have just this—no one ever does follow directions exactly—but it is something to plan around:

Corn soup with crackers and celery
Turkey or chicken, roasted
Giblet gravy Cranberries
Creamed Onions
Glazed sweet potatoes Apple salad
Minced Pie or Pumpkin Pie
Cider Coffee

Some try to think up something new and novel for the holiday dinners but I am sure that most persons really enjoy best the old fashioned dinners with the experimenting on new foods left to other occasions.

For the corn soup just make a thin, rich, white sauce and add canned corn that has been simmered with a little onion. It looks pretty and tastes good to put in the top of the soup dish a few grains of nice white popped corn. The other items on the menu are just of the everyday sort that nearly all know how to prepare and that nearly always turn out well with little effort. The main thing at a holiday celebration is good cheer and plenty of it; it's the sauce that gives everything a good flavor.—LUCY THOMPSON.

To Brighten the House in Winter

Maybe back in your woods or along some hedgerow you have the very thing that would make a bright spot of color this winter in your living room.

Bittersweet is a lovely color and is quite lasting, too. It looks nice in vases or it is pretty pinned to a window curtain.

Another attractive thing I saw lately was a lamp bracket screwed in alongside a sunny window casing. This had been painted black to make it look like the wrought iron which is so fashionable just now and a flower pot—also painted black—had been set into the place where the lamp originally stood.

In a pot was a perfectly gorgeous bunch of Chinese lanterns, that wonderful bright thing that is accommodating enough to grow wild in some parts of the country. If you do not have it near you, try some in the garden next year. It is much prettier than the bittersweet but about the same high color.

Another nice thing for such a pot is Wandering Jew, the variety that shows a lavender tinge along the edge of the leaf. This grows very fast in water if you have a little dirt in the bottom or you can plant it in just the dirt alone.

I have not been successful in making flowers grow in painted pots but some say they do. Have any of you had any experience along this line? It would be nice to know if there is any special secret to it as the paint is so decorative but I have always had to use the painted pot simply as a jardinere and set a plain one into it. I asked a dear old German gardner

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

Aunt Ada's axioms: It's too bad that the quiet joys of home are not realized by some folks until those joys are fled.

More Popular Than Ever with All-Steel Bodies

In adopting *all-steel* bodies for both closed and open models, Overland has risen to even greater strength in public favor. After all, everybody knows that steel is far superior to wood; that steel will not warp or crack; that steel outlives wood many times over. *Steel is 30 times stronger than wood!*

Most motor car bodies are skeletons of wood with thin sheets of steel nailed outside. The modern *all-steel* body is a frame of steel covered with steel—*all* steel—welded into one-piece solidity and strength. Only coachwork built entirely of steel can be finished in hard-baked enamel—a finish that defies mud, dust, miles and the flight of time.

Everybody appreciates the great added safety of all-steel coachwork—and the lasting beauty of it. Overland's big power, its reliability, its fine comfort and great economy have always appealed to owners, because they know Overland is a "round trip" car—a car that gets you there and brings you back!

OVERLAND

The shadow illustration in the background shows the difference in height between the one and four-buckle style of arctic.

How HOOD builds extra wear into this new shoe

Plainly, by building into this one, two and four buckle arctic the same extra wear that has made the Kattle King the wet weather choice of outdoor men. Note the thick extension sole. Run your hand over the soft, thick, wool lining. Compare the strength and appearance of the heavy cashmerette upper. This shoe is built for warmth as well as for wear and foot protection.

You should know the improvements HOOD is making in rubber footwear. The popular Red Boot — with its sole of the same tough rubber used in tire treads — red rubber upper practically proof against cracks and leaks. White Rock Rubbers — with their longer wear — for all the family.

This is a HOOD season — gain by it. Use the name HOOD as your buying guide. It is a time tested guarantee of design, materials and workmanship.

Valspar on the Farm—

Mrs. Miller tells an interesting story!

MAGNOLIA, IOWA,
April 11, 1923.

Dear Sirs:—

I have often thought I would write to you of our experience using Valspar Varnish, and on opening the American Magazine I saw your page and decided that now was the time.

Some years ago, in the fall, I Valsparred different pieces of furniture. After giving them several coats of varnish, I had almost a pint left. My husband had just finished his fall plowing and had driven into the yard. He started to grease his plow with the axle grease, like all farmers do, saying as he did so, "What's the use? The pigs just lick it off. Now if we had a machinery shed, my cultivator, shovels, lister and plow would be bright and shiny next spring."

I said, "Let me put some of this on." I Valsparred cultivator, shovels, plow and riding lister. Had about one-half cup left, and for good luck started on one side of our new planter. After painting one seed box and side, the Valspar gave out. The next spring the implements stood out bright and shining. Also the planter has been out for four years in the sun, rain, and snow. The Valsparred side still looks new, but the other side shows its age.

Use Valspar on the farm to save the implements from rust and wear.

Hoping you can use this, I am

Respectfully yours,
(*Signed*) MRS. R. E. MILLER,
Magnolia, Iowa.

Mrs. Miller's letter is only one of thousands we have received from farmers and housewives telling us of the wonderful satisfaction given by Valspar. You, too, should use Valspar for waterproof protection or beautiful finish on either wood or metal surfaces indoors and out — in the house and dairy — on farm implements, tools, automobiles, incubators, brooders, chicken houses, etc.

Valspar is also made in a variety of beautiful colors — Valspar Varnish-Stains and Valspar-Enamels. Unequalled for floors, doors, walls, chairs and all farm equipment — in fact, wherever you want waterproof protection combined with lustrous beauty.

about this one day and he said, "No, dey can't get der breath if de pores of de pot are all shut up mit paint."

English ivy is another thing that is lovely in winter. It is hardy, too. I saw a fine arrangement of it lately. There was a dining room wall with two regulation size windows, one in either end, and a high one in between leaving room underneath for a piece of furniture.

The man of the house built a narrow lattice that ran from the floor up the wall alongside the high window, across the top of it, and down the other side. On the floor at the foot of the lattice were two very large pots of ivy which in a few months grew so that they covered the entire lattice and made a wonderful decoration for the room. This room had a world of sunlight. Otherwise I think the ivy could not have grown on the floor.

English ivy, though hardy, is subject to leaf pests and now and then should be washed in soap suds on both sides of the leaf.—LUCY THOMPSON.

The Craze for Light Stockings

At a picnic the other day I heard two women talking. "If she could just take a good look at herself she would go right home and take off those stockings," said the first.

"It just looks," said the other, "as if she were trying to call attention to her ugly ankles."

I was a total stranger to nearly everyone there and did not know the woman in question but I could not help agreeing with the two who were criticizing her. Her ankles were very thick and she was wearing "sunburn" stockings, that is, stockings the color of a sunburned skin. With these she wore some kind of dark, low shoes and a dark dress and her ankles stood out like a warning signal; in fact, you noticed little else about her.

I have run the gamut of feeling on the subject of the craze for wearing light colored hose and while I have become somewhat reconciled to them, I think that on the average person they are inappropriate and unbecoming. Many have worn them suitably and becomingly but like all styles that are striking, they have been greatly abused.

If the feet and ankles are really lovely there is much leeway in the matter of dressing them but as few of us have such, it is better to go slow on the foot fads as they only call attention to our defects.

Did you know that most women are either knock-kneed or bow-legged? Figures prove it and that is why people who study such things tell us that it is better never to stand with the feet directly together but with one a trifle ahead of the other; leg and ankle defects show less this way.

The worst thing possible, of course, is to stand with the feet wide apart. Men manage it all right but for women it is gawky and ungraceful to the last degree. If to that posture you add ugly ankles, bow legs, and skin-colored stockings it "takes the biscuit" as I heard an old lady say the other day about her very fat neighbor who had suddenly appeared in a screaming green plaid dress.

A lot of us have a tendency to be too mouse-like and we would be much better off if sometimes we just let ourselves go and painted the kitchen chairs a bright blue or bought ourselves a splashy dress. Such things have their places in all our lives. So do colored stockings if they are of the right kind.

Nowdays you can buy lovely shoes in soft shades of gray and brown. They are as cheap and as conservative as black and with stockings to match they can readily "make" a costume. A lovely outfit is a dark dress or suit, gray shoes and stockings, a gray or dark hat, and a scarf of gray in either fur, silk, or chiffon. Don't be afraid of the colored stockings but just be sure they either match up with your costume or else that your ankles are sufficiently pretty to stand the attention they will get.—LUCY THOMPSON.

Mince Meat

Most women prefer to make their mince meat around butchering time as there are then all the odds and ends of meat that are hard to make use of in the ordinary ways and yet are ideal for mince meat. Here is a recipe I was given the other day with the highest recommendations:

Cook the meat scraps from butchering (both beef and pork are better than either alone) and allow them to cool, then grind through food chopper. To every half gallon of meat take the same amount, or a little more, of apples, grinding them also. For each half gallon of meat take a pound of seedless raisins and cook them tender. Add a quart of cherries and a pint of grape juice to each half pound of meat and then put in just enough vinegar to make it slightly sour. Cider may be used instead. Add ground spices to taste and sugar until it is as sweet as you like it.

This is good enough to use after standing just over night but longer standing improves it. If it is to be kept long, heat it through and pack it in sterilized jars.

Here is another "tried and true" recipe which Mrs. Nell B. Nichols calls Grandma's Mince Meat:

8 lbs. meat	4 lbs. suet
6 lbs. raisins	2 lbs. citron
6 lbs. currants	20 lbs. raw apples
12 lbs. sugar	2 gallons cider
12 tbs. cinnamon	4 tablespoons salt
8 tablespoons mace	4 tbs. grated nutmeg
4 tablespoons allspice	

Use either boiled beef or boiled pork for this and put through the food grinder with the currants, seedless raisins, citron, and apples. Add spices and sugar. Bring cider to boiling point and add the other ingredients. Boil one hour. Can while hot in sterilized fruit jars.—LUCY THOMPSON.

Thanksgiving Hymn

Come, ye thankful people, come
Raise the song of Harvest-Home!
All is safely gathered in,
Ere the winter-storm begin;
God, our Maker, doth provide
For our wants to be supplied;
Come to God's own temple, come,
Raise the song of Harvest-Home!

We ourselves are God's own field,
Fruit unto His praise to yield;
Wheat and tares together sown,
Unto joy or sorrow grown:
First the blade and then the ear,
Then the full corn shall appear;
Grant, O harvest Lord, that we
Wholesome grains and pure may be!

For the Lord our God shall come,
And shall take his harvest home;
From his field shall purge away
All that doth offend, that day;
Give his angels charge at last
In the fires the tares to cast,
But the fruitful ears to store
In His garner evermore.

"Then the church triumphant, come
Raise the song of Harvest-Home!
All are safely gathered in,
Free from sorrow, free from sin;
There forever purified,
In God's garner to abide;
Come, ten thousand angels, come
Raise the glorious Harvest-Home."
—Henry Alford.

Why Men are Bald

"Bald heads," philosophized the baldheaded man, "are caused by overworking the brain."

"Ha!" cried Mr. Henpeck. "That must be why women have no hair on their chins."—Everybody's Magazine.

SALES 2½ TIMES THOSE OF ANY OTHER BRAND

Certified Caps For the Holidays

Nine holiday designs await your orders. You have a choice of holly wreath design, the face of jolly Saint Nick, and a variety of "Merry Christmas" salutations; your own name, too, if you desire. Printed in red and green, the caps make an attractive and appropriate article for Christmas and New Year's.

And remember, each cap is a Certified—"the Cap with the RED Flap," with these distinctive features:

(1) the tough Red flap won't pull off;
(2) the Red flap is visible; you know it's there;
(3) no fork or knife is ever needed to lift the flap or to remove the cap—the RED Flap is grasped with ease.

If your jobber cannot supply you, write direct.

KEEP TAB ON YOUR COWS
Send 5c in stamps for samples and prices of our weekly and monthly Milk Record Sheets.
Hoard's Dairyman, Fort Atkinson, Wisc.

SAFEGUARD
Your Cows During the Dry-Feeding Period,

IN WINTER the milk-making organs are subject to severe strain. Dry, rough feeds are harder to digest and assimilate than green pasturage.

To keep up the health standard and the milk yield as well, some outside aid is needed. Otherwise a profitable volume of milk is doubtful and disease is likely to creep in.

Kow-Kare is a sure winter aid to profitable dairying. It is a great medicine-tonic to build permanent vigor into the milk-making organs. A tablespoonful twice a day, one week in each month enables the cow to make the maximum of milk from her winter diet.

As a preventive or as a reliable treatment for Barrenness, Abortion, Retained Afterbirth, Scours, Garget, Milk Fever, Lost Appetite, etc. Kow-Kare is known and praised from Coast to Coast. No dairyman should be without it.

Let Kow-Kare help you insure your dairy profits this winter. Your feed dealer, general store or druggist can supply you. $1.25 and 65c packages. Order direct if dealer is not supplied.

Write us for free copy of our valuable book, *"The Home Cow Doctor."* Thousands of dairymen ask for it each year.

DAIRY MARKET NEWS

Cheese Prices for October

Daily quotations from the U. S. Department of Agriculture show the following average wholesale prices for American cheese (style Twins) for the three large markets in October:

	Ave. price Oct. 1924	Oct. 1923
	Cts.	Cts.
Wisconsin Boards	18.4	24.5
Chicago	18.7	24.4
New York		26.0

Longhorns averaged 19.4 cents in October on the Wisconsin Boards as compared with 20.3 cents in September and 25.3 cents in October a year ago. The receipts of cheese at Chicago, New York, Boston, and Philadelphia totaled 175,129,249 lbs. for the first 10 months of the year as compared with 181,178,037 lbs. for the same period last year. Storage holdings at these markets on Nov. 1 were 23,002,976 lbs. as compared with 21,151,585 lbs. a year ago.

Milwaukee Milk Prices

The following prices are determined on for the month of October:

For the portion sold as fluid $2.45 per cwt. shall be paid for milk testing 3.5% fat.

For the portion manufactured $1.43 per cwt. shall be paid for 3.5% fat. Four cents added or subtracted for each one-tenth of one per cent variation, up or down from 3.5 fat test.

Seventy-one per cent of the total receipts was sold as fluid.—Milwaukee Co-operative Milk Producers.

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets appeared firm at slightly advanced prices during week ending Nov. 8. Trading was more or less quiet but prices were maintained. Production appeared to be decreasing. Distributing markets shared in primary market advances.

The average wholesale prices on American cheese, style Twins, for the week ending Nov. 8, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Nov. 8 1924	Nov. 1 1924	Nov. 8 1923
	Cts.	Cts.	Cts.
New York	20.5	20.0	25.0
Chicago	18.8	18.1	23.3
Boston	21.5	21.3	26.5
San Francisco	19.2	19.2	26.3
Wisconsin Boards	18.1	17.8	24.0

The receipts of cheese at these markets were 3,410,913 lbs. for the week as compared with 4,000,295 lbs. last week and 4,204,215 lbs. a year ago.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets closed the week ending November 8 no more than steady. There continued to be a scarcity of fancy grades, but medium and undergrades were plentiful. Light supplies of fancy brought forth some demand for storage butter. Production appears to be at low point. Foreign demand negligible.

The average wholesale prices on 92-score butter for the week ending Nov. 8, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Nov. 8 1924	Nov. 1 1924	Nov. 8 1923
	Cts.	Cts.	Cts.
New York	40.5	40.0	52.2
Chicago	38.5	38.0	51.4
Philadelphia	40.7	40.2	52.3
Boston	39.0	39.0	51.4
San Francisco	37.9	36.5	48.1

The receipts of butter at these markets were 9,354,201 lbs. for the week as compared with 9,882,877 lbs. for last week and 10,064,004 lbs. a year ago.

MILWAUKEE, Nov. 12—Creamery, extra tubs, 38½c standards, 37c; extra firsts, 35@36c; firsts, 31@32c; seconds, 30@32c.

Eggs—Fresh gathered, firsts (new cases), including cases candled, 49@50c; miscellaneous lots, shippers' cases returned, candled, 46@48c; seconds, dirties, 30@31c; checks, 29@30c.

Cheese—American full cream, Twins, 18@18½c; Young Americans, 18½@19c; Longhorns, 19@19½c; Daisies, single, 19@19½c; squares, 19½@20c; American, 32c; Pimento, 34c; Swiss, 42c; Brick, fancy, 18@19c; Limburger, new, 18@19c; imported Swiss, loaf, 42@47c.

CHICAGO, Nov. 17—The butter market today ruled firm following an advance of ¾c on all scores. Demand and movement active with supplies limited. Buyers were bidding for desirable lots and in some instances were paying premiums over listed prices, especially on the 90 and 91 score cars. The centralized car market shared in the advance and firmness. Offerings were limited and dealers in most quarters were asking premiums. Storage centralized cars were firm with trading fair: Fresh butter—92 score, 40½c; 91 score, 30c; 90 score, 37¾c; 89 score, 36½c; 88 score, 34¾c; 87 score, 33¼c; 86 score, 31c. Centralized car lots—90 score, 38½c; 89 score, 37c; 88 score, 34½c.

FOND DU LAC. Wis., Nov. 4—Average cheese prices, majority of sales, f. o. b. shipping point: Single Daisies, 19½c; double Daisies, 19c; Longhorns, 19¼c; square prints, 21c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Nov. 15—Single Daisies, 18¼c. On Farmers' Call Board Nov. 14—Single Daisies, 18c; Longhorns, 18½c; square prints, 19¼c.

NEW YORK, Nov. 17—Butter quiet; receipts, 5,404 tubs; fresh supply, 55,113 tubs; creamery extras, 42c; specials, 42¼c.

Eggs—Firm; receipts, 3,196 cases; fresh supply, 80,552 cases; white, fancy, 81@84c; fresh firsts, 50@64c; western whites, 37@80c.

Every man is good, but not for everything.—Proverbs of Spain.

To Honor Great Cow

California Dairy Council plans to pay a special tribute at the Pacific Slope Dairy Show in Oakland, Calif., December 10—16 to Helm Veeman Woodcrest who has just completed a world's record for milk production. This Holstein began her world record production as a second calf heifer at the age of four years, eight months. In 365 days she produced 36,217.7 pounds milk and 1,003.86 pounds butterfat, the equivalent to 1,254.82 pounds butter, 80 per cent fat. She is owned by Frank Helm, California.

An illustration of this great cow will be found on page 542 of last week's issue.

Wisconsin Cheese Convention

Steady growth has characterized the Wisconsin Cheesemakers' Association. It seems a long stretch from the first convention held in Madison in 1893, through comparatively small meetings held all over the state in various town halls, down to the present assemblage of nearly a thousand each year in the Milwaukee auditorium, with a mammoth cheese display, and 5,000 square feet of machinery displays.

This year's convention will be held Dec. 10, 11, and 12. The United States Weather Bureau office at Madison reports for December 10th, during the last 20 years, only three years when there was more than a trace of snow on the ground, and usually none at all. Up to the last minute, therefore, every maker from Superior on the north to Monroe in the south should carry on his plans and preparations to come to Milwaukee. The usual reduced railroad one and one-half fare rates will also be in force on the certificate plan, from Dec. 6th and starting back not later than Dec. 12th.

Don't fail to send your cheese exhibits. Cheese judging begins Dec. 5th. Ship by express prepaid to Supt. J. W. Cross, Milwaukee, Auditorium Bldg., and mail him the entry blanks and express receipts at once.—J. L. SAMMIS, Secretary.

Green County Holstein Sale

The Holstein breeders of Green County held their semi-annual sale at Monroe, Wis., Nov. 6—7, selling 76 head for $10,605, an average of $139. As at previous sales, the bulls sold to better advantage than did the females. Sixteen of them averaged $171 and one of them, a son of North Star Joe Homestead from a 952-lb. 12-year-old cow, topped the sale at $360. He was consigned by Baltz Hoesly and purchased by F. B. Lucksinger, Wisconsin.

Eelles, Hogan, and Gibbons did the selling with Everson in the box.

The different classes of females averaged as follows: Two yearlings, $127; 25 two-year-olds, $129; 10 three-year-olds, $139; 23 older cows, $129.

Rock County Holstein Sale

Rock County Holstein breeders' semi-annual consignment sale, held at Janesville, Wis., Oct. 29, attracted a number of Illinois buyers. Sixty-two registered animals averaged $132 and in addition eleven grade cows and heifers sold for $1,145 with almost one-half of those sold going to the Northern Illinois dairymen.

Mack and Wieland did the selling with Everson in the box. Cattle of the different classes averaged as follows: Fourteen bulls, $107; 7 heifers under 2 years old, $106; 13 two-year-olds, $124; 12 three-year-olds, $151; 16 older cows, $155.

Alfalfa Seed Crop

Alfalfa seed production is estimated by the U. S. Department of Agriculture to be one-third larger than a year ago. September prices to producers are from $14 to $16 per hundred pounds for common alfalfa and $30 to $35 for Grimm. It is also reported that there will be an increase in sweet clover seed production. Prices to producers ranged from $8 to $10 per hundred pounds.

Georgia Pure Milk League

HOARD'S DAIRYMAN:—A state wide effort for the production and distribution of pure milk was instituted here today when more than 100 Georgia milk producers organized what will be known as the "Georgia Pure Milk League".

For several months there has been considerable dissatisfaction on the part of the consuming public with the milk supply furnished Atlanta. This culminated a few weeks ago when one of the leading baby specialists of the city stated that Atlanta's high baby death rate was unquestionably due to the low quality of the milk supply. At once a milk commission was appointed by the mayor to make a thorough investigation of the matter and suggest remedies for the situation. The new Georgia Pure Milk League is one answer to the problem—an answer from the producers themselves who are just as anxious to improve the quality of the milk as anybody.

Realizing that one of the main reasons for low quality milk is the lack of proper state and city laws governing the distribution and sale of milk, the newly formed league went on record at its first meeting as favoring the enactment of laws and regulations "protecting Georgia's milk supply against contamination, substitution, adulteration, and unfair market competition". Its members also pledged themselves to maintain the standard of the milk they produced by keeping their barns and cows in sanitary condition, cooling their milk as fast as drawn, and refraining from the use of preservatives.

Members of the new organization stated that they were not opposed to pasteurization, and adopted a resolution favoring pasteurization if it could be definitely shown by experts that the method would improve the quality of the milk.

The meeting was called by J. W. Key, a prominent Atlanta dairyman and member of the Milk Commission. W. F. Cox was elected president, C. C. Tuggle, vice-president; Harry Brown, secretary; and R. O. Waters, treasurer. A drive for members will be instituted in the near future not only among producers supplying Macon, Savannah, and the other large cities of Georgia, but along the "milk routes" supplying the leading cities of the section from a distance.

Georgia. J. H. REED.

Better Bulls in Indiana

The "better bulls special" dairy train over the Erie railroad in Northern Indiana reached 9,807 people with its program and distributed 28 Holstein bulls, 13 Guernseys, 11 Jerseys, and 1 Ayrshire in the territory covered.

This program, made possible through the co-operation of L. D. Fuller, agriculturist for the Erie railroad, the dairy breed associations, the Indiana agricultural extension service, dairymen, and business men, began at Decatur on October 20 and finished at Crown Point on November 1, making 12 stops in all.

Preliminary work setting up the field for the "better bulls special" was done by representatives of the breed associations and of the Erie railroad. In securing the bulls for the train no bull was included whose dam had a record of less than 400 pounds fat.

The train and equipment consisted of four express cars containing 23 Holstein bulls, 14 Jerseys, 8 Guernseys, and 1 Ayrshire bull. A large day coach in which to give lectures and show educational motion pictures, a flat car used as a demonstration platform, an agricultural exhibit car and a private car as a home for the workers completed the equipment.

The exhibit cars were open beginning at 9:30 a. m. The real program began at 1:30 in the afternoon and consisted of: 1, an explanation of the reasons for the special by Mr. T. M. Palmer representing the Erie railroad; 2, a discussion on the need for better feeding and breeding by R. D. Canan of the Indiana dairy extension service; 3, dairy cattle demonstrations by Hugh Van Pelt. The evening program starting at 7:30 consisted of motion pictures and short dairy discussions by Mr. Van Pelt and Mr. Canan. The evening program was concluded with a talk by H. H. Pratt, an official of the Erie Railroad Company.

It was generally considered by those in charge that the "better bulls special" was a very effective means of promoting a greater interest in dairy cattle improvement.

Indiana. R. D. CANAN.

The great secret of success in life is for a man to be ready when his opportunity comes.—DISRAELI.

Plowing

is one of the many jobs the McCormick-Deering does well

YOUR late fall and winter work would be a lot easier and more profitable all around if you were in partnership with a McCormick-Deering 2- or 3-plow tractor.

Now is as good a time as any in the year for a man to come into McCormick-Deering tractor ownership. Weeks of hard work and hot weather have been exhausting man and horse. Many weeks of trying work lie ahead. Labor is scarce and high-priced, and every week's wages takes money out of pocket. Take plowing, for instance—the slowest, most laborious, most expensive farm work. It must be faced now and next year and every year.

With the McCormick-Deering 15-30 tractor one man plows 12 acres a day; with a 3-horse team he averages only 3 acres. *With the tractor he does 4 days' work in 1 day.*

With the tractor he plows deeper and better, and at the right time; heat and hard ground don't stop him; he saves the moisture and gets ahead of weeds. Between-times his tractor tackles the grain and corn harvest—runs the binders and the corn picker, fills the silo, runs the shredder or sheller—and then it finds all kinds of winter belt jobs ahead of spring's work.

Farm product prices have taken the upgrade. Better times are on the way to the farm. Be in position to farm efficiently all the year, without yielding your profits to surplus labor costs. See the dealer about a McCormick-Deering Tractor — lasting, dependable, all-around farm power.

Feed for MORE MILK and Bigger Profits

Fully 90% of all dairy rations are lacking in bulk and succulence, say authorities. Bulky feeds, mixed with concentrates, aid digestion. They also keep the bowels open.

Make DRIED BEET PULP
A part of your dairy ration

This succulent vegetable feed gives bulk in a remarkably palatable and healthful form. It is laxative, easily digested and rich in carbohydrates. It is a wonderful milk producer, promotes health and increases profits. You can use Dried Beet Pulp with corn silage or to replace it.

Ask Your Feed Dealer
THE LARROWE MILLING CO., Detroit, Mich.

Get this money maker!

Grind your own feed. Save hauling to market, and other unnecessary expenses. You can grind stock feed, also graham, rye and buckwheat flour and breakfast food with the

HOWELL *Roller Feed Mill*

Grinds twice as fast as burr mills at half the expense. Built like a flour mill. No burrs, no stones to wear out. Trouble-proof. Guaranteed to get the wild oats. Gives lifetime service.

Thirteen sizes—any capacity—a size for any engine. Write for Catalog.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Danny Applies Business Methods to Club Work

Foreword: You will remember that in the last chapter of the "Adventures of Daniel Dare", we left Danny and Jimmie Watkins working on their record books while Mr. Dare is working on his farm record book and taking inventory. The three are seated around the table. Danny has just finished the remark, "Come on, let's get at our record books." Now go ahead.

"Well, I've practically finished my record book for this year," said Jimmie. "Would you like to look at it, Danny? Perhaps it may help you."

"You bet I would," said Danny, and Jimmie handed over to Danny the record book in question. Danny opened the book and carefully examined the first page. Here are some of the things he found out.

Jimmie's corn patch was just exactly an acre in area and the soil was a mixture of clay and black loam with a clay subsoil. Jimmie had given his land a medium application of manure. The seed had been grown on his previous year's project. When tested, it gave 98% germination.

On May 31 Jimmie planted his corn with a two-horse planter. Alfalfa had been grown on the acre the previous year and pastured to hogs. The land had been fall plowed and from this year's crop Jimmie saved eighteen bushels of seed which he was drying in the attic. The total weight of the crop harvested this fall was 8,220 lbs. or 102 bushels to the acre.

Danny looked at the second page where was kept a neat record of the work. He noticed that Jimmie had charged fifteen cents an hour for his own time, ten cents for every horse hour, and twenty cents on hour for adult help. The instructions also told him to credit two dollars a year for the use of machinery and five dollars a year for the rent of the land and five dollars an acre for the loss of fertility in growing the crop. Danny spent some time studying this page while Jimmie proudly looked on over his shoulder. This is what Danny was studying so carefully:

Date	Kind of work	Number of Horses used	Hrs. at work	Total expense For Per hr.	For each job
Sept. 15	Selecting and storing	0	3	$.15	$ .45
Oct. 20	Plowing	2	7	.35	2.45
Jan. 31	Spreading manure	2	1	.35	.35
Mch. 1-6	Testing seed corn	0	5	.15	.75
May 24	Discing	2	2	.35	.70
May 30	Discing and dragging	2	3½	.35	1.23
May 31	Planting and rolling	2	1	.35	.35
June 10	Dragging	2	½	.35	.18
June 16	Cultivating	2	2	.35	.70
June 28	Cultivating	2	2½	.35	.88
July 8	Cultivating	2	2	.35	.70
	Total carried forward				$8.74

Then Danny turned over the page and came to the story. He read as follows:

"I have been a member of the K. K. K. boys for three years, this being my third. Each year I have had some success with my corn project. I have worked hard.

"In choosing the ground for my corn this year, I selected a piece of land that had been in alfalfa last year and pastured to hogs. Consequently, it was in pretty good condition to raise a crop of corn. While my corn crop from last year's project was still standing, I selected several bushels of good seed corn. This I cured in the attic on some corn trees that I had made. As I only needed about a bushel of seed for my acre of corn this year, I sold twelve bushels to my father at $3.00 a bushel. Good seed corn was selling in our community for $4.00 a bushel, but I made a discount to my father.

"When dad was doing some of his fall plowing, he let me have the team to plow my field. In the winter we hauled out several loads of manure and spread them on the plot which I had selected.

"Along in March I made a rag doll test of my seed corn and discovered that it tested 98%. This was very satisfactory. I used the rag doll method because I saw it described on the Junior Page of Hoard's Dairyman.

"I planted my acre in check rows about forty-two inches each way. Shortly after I had planted my corn, we had a heavy rain shower. This formed a crust on the soil, and to break it, I harrowed my field just as the corn began to come up. I was not bothered with insect pests to any extent this year. The only draw-back of an otherwise favorable season was the moisture. We had a little too much water during June and not enough later in the season.

"What I consider one of the most important factors in securing a large yield is the stand of corn. By this I mean having the right number of stalks in each hill, not too many and not too few. It is impossible to secure a large yield of corn if your field has a poor stand. It is almost impossible to secure a perfect stand of corn unless you plant one or two more kernels of corn in each hill than you want stalks as some stalks are sure to be broken by cultivation or wind and insect pests may also take some. The two main factors that tend to produce a poor stand of corn are poor soil and insect pests. Of these two, one is entirely under the control of the farmer, and the other is partially so.

"One thing that every farmer can and should do is to test his seed corn. He would find proof that his time was well repaid by the stand of corn he raised. Insect pests can be partially controlled by rotation of crops, poisoning, and other methods. Some loss may occur by drowning in some cases, but this can be avoided by planting only on well drained soil. Some increase in the yield can also be made by carefulness in selecting the seed corn.

"Last fall I showed some of my corn, three ten-ear samples, at the county fair and won first, fifth, and seventh prizes. My first prize sample won sweepstakes in the corn exhibits.

"I am raising yellow dent or Wisconsin No. 12 corn because yellow corn has vitamins in it that seem to be lacking in white corn. These vitamins are especially necessary in feeding live stock."

"That's quite a story, Jimmie," said Dan, as he turned over the page and came to the summary.

Receipts

Value of common stock	$ 80.00
Value of seed corn	45.00
Value of stalks, silage, or fodder	5.00
Prizes won	7.50
Total receipts	$137.50

Costs

Cost of labor (page 3)	$ 8.74
Rent of land	5.00
Loss of fertility	5.00
Cost of seed	
Rent of machinery	2.00
Other expenses	4.60
Total costs	$25.34
Net profit or loss	$112.16

"Well, I'll be jiggered! Say, you certainly did make a good profit on your acre of corn, didn't you? One hundred and twelve dollars and sixteen cents. Say, that's great. I am sure you will be the county champion again this year. I'm pulling for you anyhow, Jimmie."

"Thanks, Danny. I have worked hard on my project and I have worked hard on my record book, and I am hoping that I will win some honor on these things. But you know, Danny, that isn't all we work for in club work. Honor and glory are nice, but after all, there is a whole lot of satisfaction in doing a job well, and besides, every year I have learned something about raising corn."

NEBRASKA TEAM WINS DAIRY DEMONSTRATION CHAMPIONSHIP

Left to right—Raymond Nixon and Olin Brown. Don't overlook the cow; she was a champion Guernsey in the grade cow exhibit at the National. These boys were coached by their county agent, J. H. Claybaugh. L. I. Frisbie is state club leader.

"No, I don't think anybody in our club is going to beat you this year, Jimmie, but next year, look out. I am on your trail!"

"Go to it, Danny. Competition makes it more interesting. What are you going to write in your record book tonight?"

"Well, I haven't got much to put in, Jimmie, because I am just starting. I think it is a good plan to keep right up-to-date in your record book, don't you?"

"Yes, I do, Danny."

Danny opened his record book and with pen and ink copied some figures which he had put down in a note book, under the heading "Record of Work". He only made three entries as follows:

September 1, selecting seed corn	2 hrs.
September 6, making corn trees	4 hrs.
October 10, applying fertilizer	2 hrs.

"Is that all right, Jimmie?" Danny asked.

"Sure, that's a good start," was his answer.

Just then Mr. Dare looked up and said, "Well, boys, how are you coming with your record books? I have just about finished my job for tonight."

"So have we," said the boys.

"What do you suppose the inventory of this farm is?" Mr. Dare asked. "Twenty-three thousand, four hundred and sixty dollars," Mr. Dare went on, not waiting for the boys to even make a guess. "I never would have guessed it myself. Here take a look at my figures, boys. See if I'm correct."

Statement of Net Worth November 15, 1924

ASSETS

Live stock:		
Horses, 6	$ 605	
Cows, 15	2,000	
Other cattle, 15	616	
Hogs, 25	286	
Poultry, 200	209	
Machinery	1,523	
Feed, seed, and miscellaneous supplies	896	
Land, 156 acres at $140	23,400	
Life insurance, cash surrender value	309	
Money in the bank and in pocket	100	
Note due me from Jim Smith	75	
		$30,019

LIABILITIES

Mortgage due, 1924	$ 5,000	
Note in bank	1,500	
Unpaid store accounts	50	
		$6,550
Net worth		$23,460

"I'll say we've done an evening's work, don't you think so, boys? Why don't you two play a game of checkers? I want to show these figures to your mother, Danny."

And thus did Danny and his father and Jimmie Watkins apply business methods to farming.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

In the November 14th issue of Hoard's Dairyman you will find a further discussion of the following:

Why is the farm woodlot so important? Because three-fifths of the original timber of the United States is gone and we are using timber four times as fast as we are growing it, according to a recent report of the Forestry Service of the U. S. Department of Agriculture. Because the largest users of timber are the farmers. Because forest fires are a menace. In 1918 and 1919 alone nearly twenty million acres were destroyed by fire. (See article "Mr. Farmer, Spare that Tree".)

When was the first dairy association organized in Denmark? In 1882. Today there are more than 1,335 of these dairy associations in that country. Each of these operates a creamery with a membership of 100 to 200 patrons and using the milk from 800 to 1,600 cows.

How do these associations sell their butter? Denmark has eleven co-operative export associations doing a successful business. No butter is kept in storage but clean sales are made every week. (See article "Co-operation and Co-operative Creameries in Denmark".)

Who was Sophie 19th? This cow successfully defended the title of world's champion Jersey for several years. She gave 91,869 lbs. of milk containing 5,280.64 lbs. of butterfat

during a period of seven years. (See article "Study of Sophie 19th".)

What has become of this cow? She was recently slaughtered and her skeleton dedicated to science. The Bureau of Dairying is making a study to see if there is a relation between conformation and producing capacity.

Junior Letters

A Flower Alphabet

Hoard's Dairyman Juniors:—I am nine years old. My birthday was August 3.

My mother has 54 little chickens and 19 little turkeys. My father is milking fourteen cows now.

I am sending a poem we had to compose one day in school. I will be in the fifth grade at school next fall. Our school is out now. It was out the 9th of May.

The name of the poem is "A Flower Alphabet". Here it is:

A is for astragalus, purpling the hills.
B is for the buttercups, the sunshine of the o'erfills.
C is for cowslip that has a fragrant smell.
D is for daphia that thinks himself so swell.
E is for evening primrose so pink.
F is for fern that loves a drink.
G is for gladioli that look very nice.
H is for hollyhock that neve- blooms twice.
I is for Iris, its color is white.
J is for Jasmine that grows with all its might.
L is for lilacs that a pretty sight.
M is for Marigold, its color is yellow.
N is for nasturtium that looks very mellow.
O is for orange blossom that looks very sweet.
P is for peony that loves the heat.
Q is for quince, a yellow flower.
R is for Rose that grows in the bower.
S is for sego lily so nice.
T is for tulip that will grow twice.
U is for umbel that looks kind.
V is for violets that are hard to find.
Y is for yellow belle that looks very fine.
Z is for zinnias that look like roses of mine.

My address is Big Horn, Montana.

Marian Ickes.

The Farmer's Thanksgiving

Hoard's Dairyman Juniors:—I received your welcome letter and was glad to hear from you. Here is another poem I have made up. It has taken me some time, but at last I have finished it:

The earth is brown, the skies are gray, and the windy woods are bare,
The first white flakes of the wintry snow are afloat in the frosty air;
But the sparks fly up from the hickory log on the homestead's broad stone hearth,
And the windows shake and the rafters ring to the lads' and lassies' mirth.

The farmer's face is furrowed and worn and his looks are thin and white;
But his hand is steady, his voice is clear, and his eye is blue and bright
As he turns to look at his sweet old wife, who sits in her gown of gray,
With the cobweb 'kerchief and creamy frills she wore on her wedding day.

He bows his head to the laden board and his guests are silent all:
"Thanksgiving, Lord, for the sun and rain, and the fruit on the orchard wall;
For the silvery wheat and the golden corn, and the crown of a peaceful life—
The greatest blessing that Thou canst give, a true and loving wife!"

This white faced lover he bends to kiss her hand in its frills of grace
And the snowflakes click on the window-pane and the rafters ring above,
And the angels sing, at the gates of God,
The words of the farmer's love.

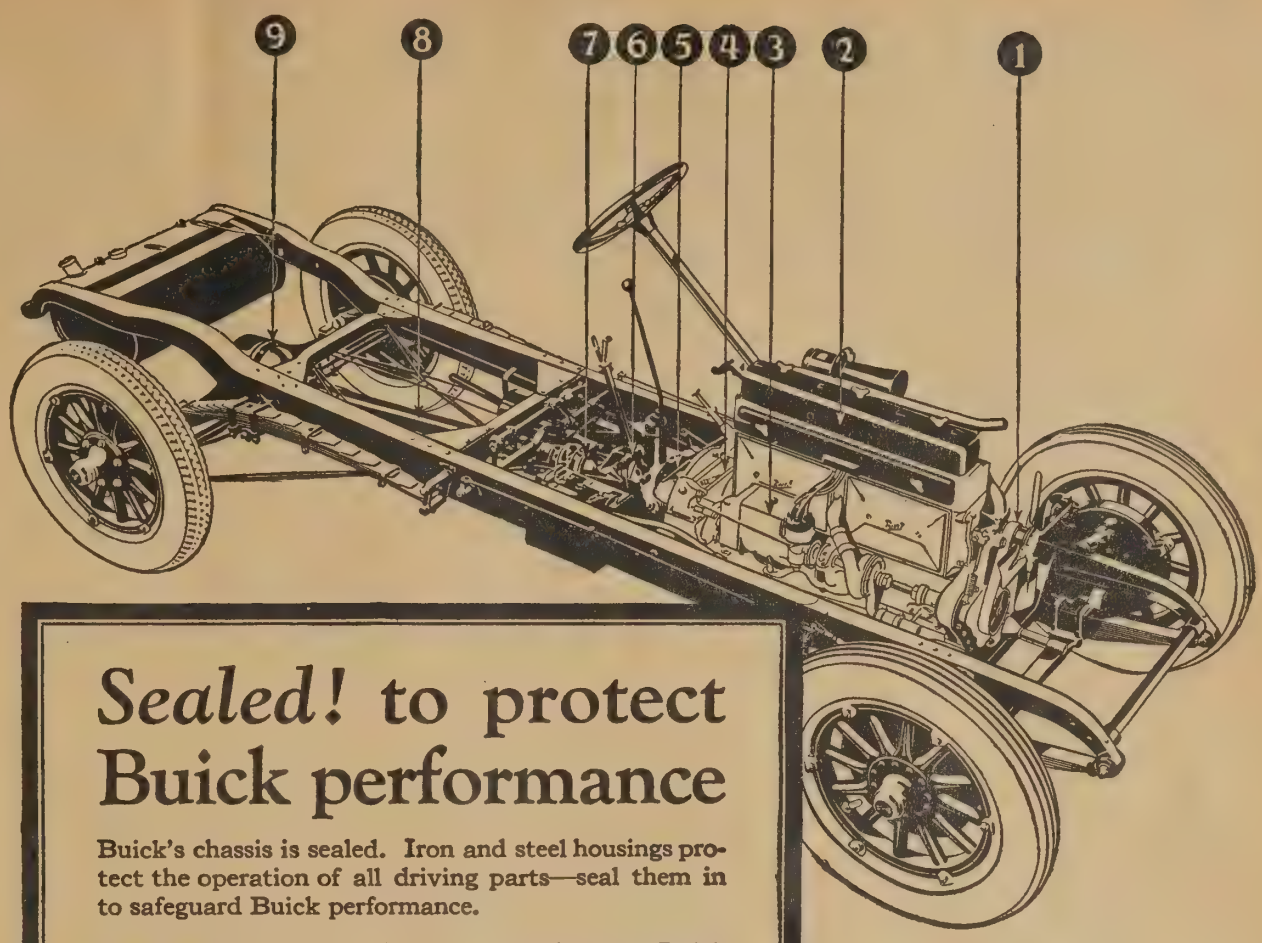
My address is Box No. 155, Smyrna, N. Y.,

Mary Elizabeth Boos.

A Letter Straight From Ireland

Hoard's Dairyman Juniors:—I have been interested in Hoard's Dairyman for about a year and especially liked reading the Juniors' columns. I received the creed, badge, and button some time ago.

I am 14 years old and 5 ft., 3 in. tall. I go to a day school, 4 miles distant. I cycle there every day, except when I ride a pony in the winter. The pony's name is Wisdom and is black with a white star. She is a good goer and jumper. I also have a smooth fox terrier called Joy Bells. She is a keen ratter. She is registered and will be in some shows this year.



I live on a farm of about 2,000 acres but about 1,000 is mountain, but is good for grazing. I have two brothers and three sisters, all older than I. We keep Shorthorn cattle, horses, sheep, pigs, poultry, and bees. We have a Shorthorn bull that took second prize at Cork Show last year.

Is there any other junior whose birthday is the 5th of November? We get three farming papers, weekly. I like Hoard's Dairyman best!

There was a big camp here about a field from our house during the war, but was destroyed about two years ago.

I hope some of your juniors will write to me. My address is Ballyvonare, Butterant, Co. Cork, Ireland.

Peter Harold-Barry.

Sealed! to protect Buick performance

Buick's chassis is sealed. Iron and steel housings protect the operation of all driving parts—seal them in to safeguard Buick performance.

Some cars have some of this protection, but only Buick has a wall of defense continuous from fan hub to rear axle against road dirt, stones, water and loss of lubricant. Only Buick's close coordination of driving units and Buick's torque tube drive make possible this important improvement.

Here are the vital points at which Buick engineering provides this extra protection:

1. Fan Hub—Fan bearing totally enclosed—lubricated by its own gear pump.
2. Motor—Steel cover keeps water from short-circuiting spark plugs. Steel cover over valve-in-head mechanism keeps dust out, oil in.
3. Starter-Generator—Delco single-unit starter-generator completely housed in single housing. Starting gears housed with fly wheel.
4. Fly Wheel—Completely housed. Starting teeth protected from road damage and accumulation of mud and dirt.
5. Clutch—Multiple disc—completely housed.
6. Transmission—Completely protected. Shifting mechanism holes sealed.
7. Universal Joint—Completely encased in ball joint at front end of torque tube—lubricated automatically from transmission.
8. Propeller Shaft—Buick's third member drive, which is a torque tube, completely encloses the propeller shaft. It is impossible for road dirt to work from the shaft into the universal joint or rear axle.
9. Rear Axle—Floating type, totally enclosed in rear axle housing.

BUICK MOTOR COMPANY, FLINT, MICHIGAN

Pioneer Builders of Valve-in-Head Motor Cars

Branches in All Principal Cities—Dealers Everywhere

When better automobiles are built, Buick will build them

From the Anderson Quartette

Hoard's Dairyman Juniors:—My brothers and sister received a letter from you and thank you very much for it. It was a very inspiring letter. We all received our creeds and my brothers, Julian and Alton, and my sister, Alice, received their badges and buttons. You asked when it is our birthdays. Alton and I were 10 years old May 24th, Julian was 11 years old on May 17th, and Alice was 12 years old yesterday (May 23rd).

We also have two little sisters. Verna was 8 years old April 17th and Margaret was 6 years on Oct. 15th. No, our cow tester did not get a calf club started. We never hear anything about it any more but we boys help take care of all of mother's calves and every time she sells one we each get 10c. She sold two beautiful heifer calves last spring that were shipped to Iowa for calf club work and she also sold a 2-year-old heifer that went out there. The little heifers sold for $125 each and the other one $200.

We have 2 little bulls here that are sold but not delivered yet. One is going to Minnesota but the other one is only going 1¾ miles from here. We have a herd of 13 pure-bred Guernsey cows. The highest cow for May gave 72.8 lbs. fat for the month and the whole herd averaged a little better than 43 lbs. We have the cutest little collie pup. Her name is Flossie.

Best wishes to all the juniors and the Junior Editor from we four juniors.

Wisconsin. Alvin Anderson.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

Wanted—Single man for general farm work; with good habits and references. Guernsey cattle, good equipment. HARVEY LONGLEY, Dousman, Wisconsin. 19-spl

Wisconsin Dairy Conference

The first meeting of the Wisconsin Dairy Conference was held in the Assembly Chamber at the State Capitol in Madison on the evening of Nov. 6. The meeting was well attended and some fourteen different state dairy organizations were represented by official delegates.

This is not a new organization but s merely a gathering of the several state organizations under the auspices of the State Dairymen's Association, from which have sprung all the others. The Dairymen's Association dedicated one session of its annual meeting to this purpose and it has been requested to continue this in the future. The principal address was delivered by E. R. McIntyre on "The Interdependence of the various Branches of the Dairy Industry".

Mr. McIntyre depreciated the creating of more organization. "The need is far more urgent than this," he declared. "It is to unite what organizations we now have and weld them into an informal congress to perpetuate all that is fine and upright, and to advocate the economical and practical movements, as well as to confer on defensive tactics." He stressed the necessity of greater efficiency and economy of production, better marketing and salesmanship, and the improvement of quality.

Following this address was a round able discussion by representatives of he several organizations present. This prepared the way for an energetic display of what needs most emphasis for the improvement of dairying and the solution of the problems confronting the various organizations. The interchange of opinion and emphasis brought home to those present that each phase of the industry has its pressing problems and it is doubtful whether anyone of them is paramount to all others.

At the conclusion of the session the Secretary of the State Dairymen's Association was requested to call a similar conference at the time of its next annual meeting. A committee was also appointed to outline the future plans and policy of the conference. This committee reported, in part, as follows:

"It is the consensus of opinion of all sane, practical dairy workers that *economy*, *uniformity*, and *quality* of production, processing, and distribution are essential points for the success of the dairy industry. * * * To accomplish these purposes we propose to create a working unity between the agencies which have the necessary information as to how success has been achieved in these things and the agricultural press of the state that can give large publicity to this information. We also believe that closer co-operation can be secured through the various dairy groups and we ask that other meetings be called by the State Dairymen's Association to discuss specific problems of the industry. We also suggest that the officers of the allied units be asked to issue quarterly statements on the condition and outlook of their various organizations."

Selling Milk

"Salesmanship is rapidly growing in importance because the big problem in industry now is not how to produce merchandise, but how to sell merchandise," says M. O. Maughan, secretary of the National Dairy Council, in a little booklet entitled, "Manual for Milk Salesmen".

The purpose of the booklet is to help those interested in the distribution of milk to apply modern salesmanship methods in their work.

The author discusses the subject from the standpoint of: 1, Knowing your merchandise (milk); 2, Knowing your customer; 3, Knowing yourself and the development of a successful personality; and 4, Making the sale.

To the salesman of milk Mr. Maughan says: "Your merchandise is the greatest article on sale today because it is the most important article of food known to mankind. Know your merchandise thoroughly.

"You should know the needs of your customer and work towards the filling of these needs.

"An attractive business getting salesman is a combination of three factors: 1, Neat, clean, attractive dress; 2, a healthy body; 3, a combination of certain qualities, such as enthusiasm, honesty, tact, self-command, courtesy, cheerfulness, promptness, memory, sympathy, and initiative.

"In selling goods the mind of the buyer must be led through four steps which are: 1, favorable attention; 2, favorable interest; 3, favorable desire; and 4, favorable action."

The booklet is well written, concise, neatly bound, and would be helpful to milk salesmen.

Meeting National Dairy Council

In accordance with the by-laws, notice is hereby given that the annual meeting of the National Dairy Council will be held at the Auditorium Hotel in the city of Chicago, Illinois, on December 4th, 1924, at 10 A. M.

M. O. MAUGHAN, Secretary.

Send for this
true story of a land of better farms

From everywhere they came, farmers from South and East, from Kansas and from Maine, to seek a land of better farms.

Seventy thousand of them have found this land in Washington.

There, where fifty years ago was little more than wilderness, they have built a splendid farming country. There they have found happiness and prosperity, a profitable place to work, a glorious place to play.

And there, where farming is a better paying business, is opportunity for a hundred thousand farmers more.

Read this interesting free book

Perhaps you too will wish to farm in Washington. That is something you can tell only when you know the facts.

And these facts you will learn when you read the book, "Washington for the Farmer." You will find this book interesting and instructive. It is generously illustrated and, we believe, the most complete and reliable handbook on the state of Washington.

You can get it free. Just write, or mail the coupon below, and we shall be glad to send it to you by return mail.

The Whatcom Plan of Testing

(Continued from page 586)

day, then he leaves a memorandum with the sample bottles and the herd record sheet. In nearly every case, during the first year's work, members who have missed the tester on his first trip to deliver the bottles have met him the next day when he calls for the samples. This resulted last year in 95 per cent of the members feeding balanced rations recommended by Mr. Anderson.

Half of the members on this route will be given assistance during Monday morning and a part of the afternoon, leaving only time enough for the tester to deliver the sample bottle to the other half. This makes it so that by Monday evening all the members on the route will have their sample bottles and will be ready and reminded to take the test during the next two milkings.

Tuesday morning arrives and the tester proceeds over the same route collecting all the bottles and the field sheets which have been made out by the dairymen, giving the names of the cows, amount with weight of all feed used by individual animals, and any remarks which might help the tester in analyzing his month's work. During Tuesday the tester will give suggestions and help to the other half of the dairymen to whom he delivered the sample bottles the day before but did not help them with their problems. In this manner all of the members of the association on the route are taken care of each month. This same process is repeated on the other nine routes.

One of the questions coming to mind at this time is, how does the tester have time to analyze the work, and following is the answer. After the tester receives the general information from the dairyman on a cow as recorded on a field sheet, the test is run, the field sheet is filled in further detail, and then sent to the state extension service office.

The test is run by Mr. Anderson personally at a local creamery, and he makes all records of the test. If he is overcrowded, he has the permission of the Board of Directors to hire someone to help him with the record work, but he always reads the samples to the one who is helping him.

In order that he may have the information to do extension work, the compiling and analyzing of the records are made for him at the office of the extension service and a barn sheet made out.

Armed with all this information the "tester" or "assistant county agent" has a definite basis upon which to work. Each month he calls upon every member of the association for samples; as explained above, he helps him with his immediate dairy problems because he has analyzed and knows the condition of his herd. The actual extension work requires seven days during each month while the balance of the time is spent by the tester in doing regular testing work.

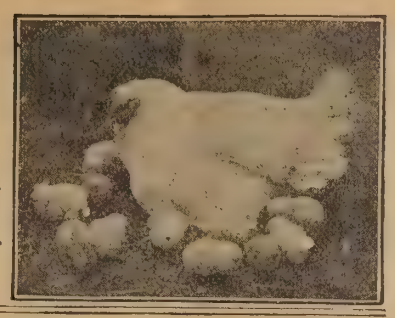
It was mentioned before that the association had solved the problem of finances, at least to the place where each member can receive not only the testing work, but the services of a dairy specialist. The annual report of the Board of Directors shows that the association received for testing dues $2,030.75 last year with expenses for testing, salary, auto expense, and stationery, amounting to $1,943.80.

Mr. Anderson, the dual-purpose tester, receives $175.00 per month divided as follows: From the association as salary, $85.00; from the association as auto expenses, $40.00 per month and from the State College of Washington, extension service as assistant county agent of Whatcom County, $50.00. This makes $1,500 per year from the association and $600 from the extension service, or a total of $2,100 per year.

The annual report of the directors shows that the association received for testing dues, $2,030.75 during the year 1923. If one figures the receipts at $1.25 per cow on the 1,725 cows for the entire year, it would amount to $2,156.75, but it must be taken into consideration that not all the 1,725 cows were in for the whole year. When the association began work for the year 1923 there were only 1,100 cows signed up, but when they finished testing for the month of December, 1923, there were 1,725 cows on the books. As the payments per cow are made every six months, this would explain the difference in receipts and cows.

Since the association pays from its funds the sum of $1,500 per year for the tester and his car and the annual report showed an annual expenditure of association funds amounting to $1,943.80, the difference, or $443.80, was charged to stationery, supplies, and testing. However, by a vote of the association, their secretary was given a fine gold watch, as appreciation for his splendid work during the year, in taking care of the clerical work outside of the records.

Now it requires the help of a clerk in the extension office to work out the barn sheets and reports, but this clerk is likewise a dual-purpose one, for while she is working on the records of the 1,725 cows, she is also gathering data for cost accounting in the dairy industry of the state. As she is part time clerk, her salary of $40.00 per month must be charged to the work of an assistant county agent clerk.



Dairymen are satisfied with the "Whatcom plan", for when 1,500 out of the 1,725 cows are signed up with little or no effort, that is proof that the "test is being put into testing".

"I belonged to the old plan organized in 1917 and liked it very much, but the present plan suits me better. I get more service; it keeps me in closer contact with what my cows are doing and helps me place proven sires," said K. B. Aker.

Whatcom County has an association which gives more service at a cheaper rate than any tried out in the state of Washington before, and because the tester is backed by the extension service and able to help the dairymen each month, they are anxious to continue with the new type.

[EDITOR'S NOTE:—Members of cow testing associations will observe that under the "Whatcom Plan" the state is providing the clerical work in compiling and entering the records on each cow and making out the monthly report to each farmer. In addition it pays over a third of the tester's salary. It is doubtful whether many states would find it possible to finance this plan for any considerable number of association. It will also be observed that each farmer takes his own weights and samples, which he records on the barn sheet together with the feed consumed. Where the farmers will do this work it simplifies the method, reduces cost, and will fulfill the basic purpose of cow testing. However, such records cannot be considered other than private herd records and are of doubtful authenticity for publicity purposes.]

POULTRY On The DAIRY FARM

J. B. HAYES

Paralysis

A condition or disease is somewhat prevalent at the present time and has not been entirely explained. Work is still in progress, some preventive measures have been adopted, and progress has been made but not sufficiently to answer the questions that are raised. Most of the lack of definite information results from a wide variety of possible causes that are found from a post-mortem examination.

Several names have been applied to this condition but is most commonly called paralysis. Hens are affected in the greatest number during the winter but it may also be apparent in half grown young chicks on range. In many cases thrifty cockerels or pullets weighing four to four and a half pounds will be the victims.

In mature hens there seems to be three possible causes. The first is caused by worms which, under some conditions, will cause a condition called limberneck, while under other systems of management the hen will lose entire control of her legs. A post-mortem examination will show the round worms or tape worms to be present in large numbers.

A second form is induced by the hen becoming egg bound. When the egg stops in the oviduct and the hen is unable to dislodge it, she will show the same symptoms. Removing her from the rest of the flock to a quiet place where feed can be decreased will often act as a cure. Feeding freely of fresh, succulent green feed is especially advised. The introduction of sweet oil through the vent will generally allow the egg to be produced.

The third form, showing exactly the same symptoms, seems to have no explanation. Lack of direct sunlight has been suggested as one possible cause but has not been efficiently tested to be conclusively proved. Possible lack of some mineral in the feed has been another thought but a long continued series of blood tests will necessarily have to precede the acceptance of this reason.

Fairly satisfactory results have been obtained by the observance of a strict quarantine of the old stock. Exception is taken to the statement that old and young stock should not have access to the same range by farm flock owners who are successfully rearing that way each year. It is just another example of locking the door after the horse is stolen, for one never knows when trouble will appear. A chick range away from the old stock is not an impossible problem on any farm and is well worth the added trouble in the increased gain obtained.

With an increased size of the farm flock from year to year, and the larger number of chicks which must be brooded to replace the laying flock, one will find that the possibility of disease will become greater. Even if a separate range, for brooding the chicks at least, is not used, the ground where the greatest congestion results should be tilled, treated with lime, and seeded. Prevention is worth more than all the treatments that have been advocated.

At the present time a special tobacco dust has been placed on the market for use with poultry. This material is used at the rate of two pounds to one hundred pounds of mash and is incorporated at the time of mixing the dry ingredients. This possibly offers an advantage over the former method of steeping in hot water and mixing with a moist mash. Even with this mixture, Epsom salts should be given to the flock at regular periods.

For individual cases where the fowl has paralysis that is induced by round or tape worms, oil of turpentine is the treatment. This means handling each fowl but will obtain results. One teaspoon of oil of turpentine can be introduced directly into the crop by means of a tube and funnel and is followed by an equal amount of castor oil in about three hours. In many cases, the turpentine and oil are mixed and administered at the same time.

The possibilities of direct sunlight are not known for such cases. Beneficial results of direct sunlight into the house through open windows is noted each day and should be followed. It is only by opening the windows and allowing light to enter that results are obtained, for filtering through glass removes or excludes the helping rays. In any portion of the country there are very few times when it is inadvisable to open the windows for at least an hour or more during the middle of the day.

Because of the rather low value per hen which is attached to poultry, one has been advised time after time to kill each sick or ailing fowl. In some cases this procedure is advisable but the average flock owner is too well satisfied with that step. Rather than calling a halt at this point, he should be more interested in discovering what is back of the scene that causes the trouble.

Every experiment station is equipped with facilities to aid in this work, generally without cost. If one ships a live specimen that is sick, a laboratory examination will reveal the cause and control measures can be recommended. Getting the jump on an outbreak is half of the job.

Most of the paralysis can be controlled by proper attention to the chick range to prevent worms, tobacco or similar treatment to old or young stock when placed in winter quarters, liberal supply of direct sunlight into a clean, well ventilated coop, and adoption of sanitary measures with the flock.

Sprouting Oats for 800 Hens

Is it practical and profitable to sprout oats for 800 laying pullets? Would dried beet pulp fed in small quantities be good for laying pullets? We fed first class finely cut ensilage advantageously one winter. What is the feeding analysis of beet pulp?

Greencastle, Ind. R. A. M.

The deciding factor in sprouting oats for 800 pullets is primarily a question of labor involved and the possibility of obtaining some other form of green feed that will be equally satisfactory. The use of sprouted oats is advisable occasionally during the winter as a change for the flock. However, one will find that quite a bit of equipment and quite a bit of time will be needed in order to properly handle the amount of material which will be required.

In cases where a person can obtain cabbage, mangels, or material like that, they can be used just as satisfactorily and require considerably less time in preparation than the sprouting of oats.

Dried beet pulp has never been used to any great extent for poultry feeding. In cases where this material is used it would be necessary to moisten it before feeding and one must be careful in moistening to see that it is just damp and not soggy and saturated. Any sloppy feed of that sort that is given to a flock is very apt to do more harm than good in that it is very apt to throw the entire flock out of condition. The analysis of beet pulp, according to Henry and Morrison, is 91.8 dry matter, 4.6 crude fibre, and 0.7 true protein. In consideration of green feed it is a succulent material and the vitamins that one is primarily interested in rather than the food value of the material.

We have quite a few persons that are using corn silage to good advantage as a form of green feed for the birds. The feeding of this material this year may be rather a problem though because of the quality of silage which has been obtained from the immature corn which was placed in the silos.

It is generally possible to obtain cabbage at a price low enough to warrant purchasing that or to obtain mangels or sugar beets as a constant supply of green feed with the sprouted oats used as sort of a change occasionally.

Own Your Feed Factory
Save $10 to $20 per ton

With these two wonderful new patented machines you can duplicate any high priced balanced ration mixed feed on the market and save half their cost.

The Masticator Hammer Mill is the only mill that makes fine meal of cornstalk, corn in shuck, alfalfa, peavines, oats, any kind of grain or any other roughage. Operated with 8 H. P. engine. The Maclellan Batch Mixer makes a perfect mix in one minute.

We give you the best known standard formulas free. Two famous feeding experts will help you with your feeding problems. Whether you are feeding dairy cows, cattle or poultry you need this equipment.

Masticator Hammer Mill $150.00
Maclellan Batch Mixer $100.00

They are sold on trial. Will save their cost many times—every year. Write for catalogue.

AYRSHIRES

WALLIS FARMS AYRSHIRES
Breeder of Registered Ayrshire Cattle, now offering for sale individuals of both sex, based on records and performance.
Federal Accredited Herd.
H. M. WALLIS, *Owner* Racine, Wis.

Production and Individuality
must be combined in the breeding of your next sire. Our success in the showrings of the U. S. and the production of our herd insures you getting individuals from us that will make money for you. We are now offering six young bulls eight to fourteen months of age sired by HOWIE'S KING OF HEARTS or CAVALIER'S LORD ROSEBERRY. 6 bred heifers and 10 young cows. Write for prices and information.
ADAM SEITZ & SONS WAUKESHA, WIS.

Ayrcroft Farm Ayrshires
have again proven themselves winners in the show ring as well as producers. Write for what you want. Herd Federal Accredited.
B. B. SIMMONS & SONS, Pewaukee, Wis.

Pure Bred Ayrshire Cattle For Sale
Accredited herd No. 63105. Maud of Fernbrook 14th, state class leader. Junior two-year-old, 13280 lbs. milk, 477 lbs. fat. Herd sire, Alta Crest Mainstay. Grand Champion over all breeds Junior live stock show, Madison, 1922.
Wm. NISBET & SONS, Richland Center, Wis.

Accredited Ayrshires
Good type and production are found in our herd. A special price on young stock. Write for prices.
W. T. SHUTTLEWORTH,
Route 4, Ypsilanti, Mich.

Attractive Ayshire Offering
BULL BORN APRIL 18, 1924
Color: white with brown cheecks. He has a level back, well formed rump and clean cut head and shoulders. Sire, Penshurst Rising Star, 20922. Dam, Favorite's Beauty, 50089, a large, typy foundation cow with big udder and good teats. A. R. Records: 10,556 lbs. milk, 456 lbs. fat, 4.32%; 11,470 lbs. milk, 512 lbs. fat, 4.47%. Again on test.
Herd Federally Accredited—Certificate No. 10241.
Price: $125.00
GLEN FOERD FARMS, Torresdale, Pennsylvania.

High Producing Ayrshires
AT FARMERS' PRICES
Young cows, heifers, and bull calves for sale. Sires backed by world's record production and most popular breeding. Herd federally tested.
CLOVER BROOK FARM, R. F. D. 2, Bristol, Pa.

FOR SALE
Twenty-five well bred Registered Ayrshires (accredited herd.) Mostly heifers, one to eighteen months old. Some foundation cows. Personal inspection desired.
FRIENDS HOSPITAL, Frankford, Philadelphia, Pa.

Better Milk Bigger Profits

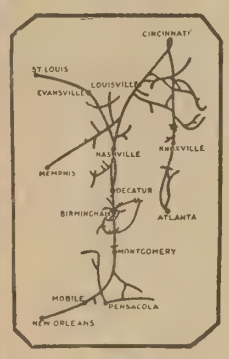
Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

THE H. H. MILLER INDUSTRIES CO., CANTON, OHIO
successors to
Chas. Skidd Mfg. Co.
Janesville, Wis.

EDGERSTOUNE FARM AYRSHIRES --- Type + Production
Five daughters of Hobsland Lucky Boy 16482 average 12,988.7 lbs. milk, 522.29 lbs. fat. This farm won in 1923 1-R of H. Silver Medal, 4 advanced Registry Silver Medals and 2 French Cups.
CHOICE YOUNG BULLS FOR SALE
MRS. JOHN G. WINANT, Owner GEORGE A. HILL, Manager



Go South Young Man!

Years ago the cry used to be "Go West!", but now the tide has turned, and the real opportunity in the United States lies in the South. The young man with energy and initiative who starts out today can make a wonderful success in this great agricultural section.

The South needs more blooded cattle and dairies and creameries. You can make money here. Operating costs are lower than in the North. Splendid grazing lands are available at low prices, and foodstuff can be grown at all seasons. The winters are short and not severe, so that housing and stall feeding cost less, and the work of caring for the herd is much reduced.

The L. & N. Railroad will gladly give you full and free information about desirable localities, operating conditions, transportation, markets, prices, etc., in its territory, which is in the heart of the agricultural South.

THE OLD RELIABLE

Super Zinc-ed TRADE MARK **WIRE FENCES**

"Super-Zinced" Fences are guaranteed unexcelled in quality and long life. They are armored against rust by our improved process which bonds to the steel an extra heavy zinc armor that will not crack or peel. The wire is made complete in our own mills and given the most rigid tests before it is made into "Super-Zinced" Fences.

Pittsburgh Perfect & Columbia Fences

are all "Super-Zinced", and in these two brands you will find the exact styles for your different fence needs. They *cost no more* than ordinary galvanized fences, but give many years of extra service. Inclosures with "Super-Zinced" Fences enhance the appearance and increase the value of farm, garden and lawn.

"Super-Zinced" Fences permit better farming and increase farm profits. Send for catalogue of "Super-Zinced" Fences and 72-page Farmers' Handy Manual, both FREE.

Pittsburgh Steel Co.
725 Union Trust Bldg.
Pittsburgh, Pa.

Gentlemen: Please send me FREE your Farmers' Handy Manual and account book with a catalogue of "Super-Zinced" Fences.

SWING-HAMMER
FEED MILL

The MILL, the PRICE and the TERMS are Right

Manufactured by
Jas. A. Day Feed Mill Co.
Knoxville, Tenn.

Red Strand (top wire)

50

Longest Lasting farm fence ever made

The patented "Galvannealed" process puts 2 to 3 times more zinc coating on the wire than is possible by the ordinary galvanizing method. Therefore, we are able to guarantee this new Square Deal to far outlast any other farm fence made—sold at *no extra price.*

The Triple Life Wire **Galvannealed** **Square Deal Fence**

15 to 30 points copper in the steel from which Square Deal is made causes it to resist rust more than twice as long as steel without copper. There is about $5.00 per ton more actual material cost in copper-bearing "Galvannealed" fence, yet the price to you is not one cent more than the ordinary galvanized kind. Let us send you absolute proof of all claims made for this extra long life fence.

FREE to Land Owners Nationally recognized authorities back up our claims. Send for copy of "Official Proof of Tests." We'll also send Ropp's Calculator—and—Square Deal catalog. All 3 mailed free. Address:

Keystone Steel & Wire Co.
1750 Industrial St., Peoria, Ill.

No Extra Price

Association Notes by Testers

Jackson Co. F. B., Minn.: One silo was erected, making 22 silos on 28 farms. One barn was completely remodeled and modernly equipped. Several barns underwent a few changes so as to hold more cattle. A new tile milk house and garage combined were erected this summer. Five new separators replaced old ones. One new electric motor and one gas motor were installed.—C. W. Meyer.

Prince William Co., Va.: The 553 cows tested last month averaged 565 lbs. milk, 22.4 lbs. fat; 68 cows made over 40 lbs. fat and 15 over 50 lbs. The corn crop is very poor in this section. Most dairymen are putting all their corn in the silo and a good many did not get their silos filled. Market milk sold for $2.38 per cwt. and retailed for 12—14c per quart last month.—T. T. Curtis.

Kane Co. No. 2, Ill.: The record of the high cow for last month was made on alfalfa pasture supplemented by 6 lbs. of grain. Sixteen grade Holsteins owned by Lewis Riedelsperger made an average of 985 lbs. milk, 33.1 lbs. fat, the best for last month. Of the 637 cows tested, 140 were dry and 68 fresh since the last test. The average production was 726 lbs. milk, 25.3 lbs. fat. Profit per cow in milk $10.91; feed cost per 100 lbs. milk, 88c. Forty-one cows made 40 or more lbs. fat. The 25 grade and pure-bred Holsteins owned by Henry Butt completed their second association year with an average of 8,326 lbs. milk, 295 lbs. fat, compared with 7,470 lbs. milk, 256 lbs. fat last year, a gain of 856 lbs. milk and 39 lbs. fat in one year. The herd was the same as last year with the addition of a few two-year-old heifers the second year. At the average price of milk the gain on two cows more than paid the association dues. Fourteen pure-bred Holsteins owned by C. E. Warford & Son have just completed a year's work with an average of 12,226 lbs. milk, 415 lbs. fat, Eight of the 14 were under full age. None produced less than 10,000 lbs. milk and ten made over 365 lbs. fat apiece. Homstafa Queen Ormsby, a junior three-year-old, made 15,082 lbs. milk and 540 lbs. fat in the association year. A five-year-old grade Holstein owned by Oliver E. Pritchard produced 16,672 lbs. milk, 649.4 lbs. fat in ten months at a return above feed cost of $319.04.—W. K. Bullock.

King Co., Wash.: Due to the continued milk war in Seattle, market milk continued at the same price which condenseries paid. The feeling between the factions seems to be increasing, with no indications of settlement in sight. Prices of hay and grain continue at a high level, with a possible exception of alfalfa hay which may be weakening a little. In October market milk sold for $1.85 per cwt. The condensery and cheese factory paid $1.85 for 3.8% milk. Milk retailed for 9c a quart.—H. Dempsey.

Sioux Falls, S. D.: Ten more dairy cows were introduced into the association. One new milk house was built. There is a crying need for dairymen in this section. Last month market milk sold for $1.75—2.50 per cwt. and retailed for 12c per quart. The creamery paid 33c per lb. for fat.—C. E. Heeren.

Wellsville—College Ward, Utah: Many association members are interested in grain feeding and are making preparations to feed grain this winter. The majority feed hay. One member put a cement floor in his cow barn. Last month the condensery paid 44c per lb. for fat.—R. Hansen.

Mesa Co., Colo.: Production for October showed an increase of 4 lbs. per cow over last month. Cost of production decreased 6c per lb. fat due to fall pasture and more abundant feeding. Market milk sold for 20—25c per gal. and retailed for 10—12½c per quart last month. The creamery paid 36c a lb. for fat.—C. H. Boyd.

Lehigh Co., Pa.: One member purchased a carload of pure-bred Holsteins including a well bred bull to replace a scrub. Two members installed drinking cups. One modern calf barn was built. Corn is nearly all cut and some is being husked. All silos are filled. Potato crop is good but apples very scarce. The feed cost per 100 lbs. milk in the association for October is $1.76; for 1 lb. fat, 46c. Market milk sold for $2.80 per cwt. and retailed for 12—20c a quart last month.—W. W. Sassaman.

Des Moines Co., Ia.: At least 20 carloads of cull and scrub cattle from outside sources have been sold in this section for prices ranging from $50—$100. The quality of these animals sets the dairy industry back at least 20 years. Fortunately none were purchased by association members. In October market milk sold for $2.40 per cwt. and retailed for 10c per quart. The creamery paid 34c per lb. for fat.—C. M. Deem.

Branch Co., Mich.: The average production per cow for October was 538 lbs. milk, 21.59 lbs. fat. Dairymen in this locality are thoroughly disgusted with the flat rate on milk. A plant which would buy on the butterfat basis would be appreciated and patronized. The condensery paid $1.40 net flat rate per cwt. for milk.

Milk retailed at 12c per quart, butter 43c a lb.—L. Q. Kitchen.

Montcalm, Mich.: Members are beginning to feed silage and get cows in from the pasture. The high cow, a two-year-old, for October had only 25 days to her credit for 1,300 lbs. milk. Last month market milk sold for $2.40 per cwt. The condensery paid $1.75 per cwt. for milk, the creamery 37—41c per lb. for fat.—K. S. King.

Mocomb No. 2, Mich.: At a meeting held October 29th, Dr. Smith of the Detroit Creamery Farms gave a talk on care and preventive measures of abortion in cattle. George Girsbach of the Michigan Dairy Extension Department talked on bull association work. Last month market milk sold for $3.00 per cwt. basic f. o. b. Detroit and $1.59 for surplus f. o. b. Detroit.—C. Blumer.

No. Eaton, Mich.: In preparing the annual report, 41 cows were found to have made a profit of less than $40 above cost of feed. Nine cows produced over 400 lbs. fat and the high cow produced 537.5 lbs. fat and showed a return of $3.41 for each dollar expended for feed. The condensery paid $1.55 per cwt. for milk in September.—H. E. Frank.

Alpina—Leer, Mich.: There was a decrease in milk production last month due to the dry cows. Three silos were erected and one milk room constructed. Milk retailed for 15c per quart, butter 45c per lb.—C. Jennings.

Berrien Co., Mich.: All members use pure-bred bulls and the majority are anxious to own herds of all pure-bred females. Market milk sold for $2.12—2.25 per cwt. and retailed for 10—13c per quart in October.—P. L. Hemingway.

Oakwood, Wis.: The high cow for the first six months produced 10,446 lbs. milk, 349.8 lbs. fat; value of milk, $235.14; cost of feed, $78.56, leaving a profit above cost of feed of $156.58. The high herd for six months is owned by Alf. Mahr, his 13 cows averaging 1,269 lbs. milk, 39 lbs. fat.—V. M. Pinnewell.

Verona, Wis.: The association picnic was well attended. Last month market milk sold for $2.13 per cwt. The condensery paid $1.65 per cwt. and the cheese factory $1.37. The creamery paid 41c per lb. for fat. Milk retailed for 9c per quart, butter 41c per lb.—G. W. Weihing.

Farmington, Wis.: Tuberculin testing is under way in this association. The first five herds tested were found clean and five reactors were taken from the other two. In the course of a few weeks the entire association will have been tested, putting the majority under the Federal Accredited Herd system. The condensery, cheese factory, and creamery paid 50c per lb. for fat last month. Milk retailed for 12c per quart.—J. G. Strathearn.

Sheldon, Wis.: A meeting will be held at which there will be shown lantern slides, also a lecture will be given on feeds and feeding by the tester, followed by a basket social. Members are starting to feed silage and hay. The cheese factory paid 42c per lb. for fat, the creamery 37c in October.—G. E. Ronne.

Independence, Wis.: At the association sale held recently 40 head sold for an average of $53.00 per head. Three head sold for $100 each. A Guernsey calf topped the sale on bulls at $115.—P. Nelson.

Central Monroe Co., Wis.: Five faulty separators were found last month. The last scrub bull has been sold and a new registered one with three generations of high records replaces him. One member is building a new cement stave silo. Last month the creamery paid 42-44c per lb. for fat. Milk retailed for 8c per quart, butter for 41c per lb.—V. Sorenson.

Westby—Jersey, Wis.: During October 403 cows were tested; 24 of these produced over 40 lbs. fat. Several members are feeding grain and silage. One herd was tested for tuberculosis and one reactor found. This is the first reactor out of four herds tested since the association started in June. The creamery paid 41c per lb. for fat in October. Milk retailed for 10c per quart.—H. Oehmcke.

Tennyson—Dickeyville, Wis.: Last month 10 cows produced over 40 lbs. fat. Cel Winkler had the highest herd average of 649 lbs. milk, 35.4 lbs. fat. Two farmers built additions to their barns. In October the cheese factory paid 41c per lb. for fat, the creamery 37—38c.—J. Aufdermauer.

Lancaster, Wis.: Several herds are being tested for tuberculosis. One member purchased a pure-bred sire whose dam has a record of 606 lbs. fat. Another member built a new cement stave silo. Of the 463 cows tested, 68 were dry and 21 made over 40 lbs. fat. One member sold two grade Guernsey heifers for $125 each to an Illinois buyer. Last month the cheese factory paid 45c per lb. for fat, the creamery 40c.—A. J. Claridge.

Hammond—Baldwin, Wis.: Seven herds were tested for tuberculosis and no reactors found. One member unloaded a carload of lime. All members feed grain. Last month the creamery paid 45c per lb. for fat. Milk retailed for 8c per quart, butter 39c per lb.—O. Berkseth.

Spring Valley, Wis.: Sixteen members weigh milk daily and more will start soon. Two associations are expected to be formed out of this one for the coming year, making seven associations for Pierce County.—J. J. Taylor.

Denmark, Wis.: A meeting of the cow testing association members was held October 15th. J. M. Kavanaugh gave a splendid talk on cow testing association work and a film, Jonathan Bar's Conversion, on cow testing work

(Continued on page 596)

Are Wisconsin Factories Moving Away?

THAT IS A LIVE QUESTION. It deserves a correct answer. First of all, people should know what "moving away" means. It includes:

1. Changing Wisconsin corporations into outside corporations by re-incorporating in other states.
2. Selling Wisconsin corporations to outside companies and continuing the factories here as branches.
3. Moving main offices to other states.
4. Setting up separate outside corporations to operate Wisconsin factories.
5. Change of residence to other states on the part of officers, office employes and skilled workers.
6. Actually moving the factory out of Wisconsin.

Those Things Are Going On Now

When one or all of them happen, it means:

1. Loss of money and opportunities for every man, woman and child in the state.
2. Loading onto people who stay here, more of the cost of government—taxes.
3. Retarding the future growth of our state.
4. Lessening employment for Wisconsin labor.
5. Reducing the home market for Wisconsin farmers.

Why Be Blind to the Facts?

The processes above outlined are now in motion. They are being forced, by agitation for unfair laws aimed at Wisconsin industry.

Agitators and political propagandists cry "bluff" and "lies". Get the *FACTS* as given in these ads and decide for yourself what and whom to believe.

Remember this: "moving away" does not alone mean tearing down or closing factory buildings. But whatever form it takes, it hurts Wisconsin and it hurts *you*. Read this ad again. Write us for information. We want people to get the facts. When once they have them, Wisconsin will go forward by leaps and bounds.

"Ah! that's better now"

FOR a lame back, stiff neck or any muscular strain, Gombault's Balsam is the remedy you can depend upon to give relief that's quick and sure.

It's equally effective for cuts, bruises, sore throat, bronchial cold, muscular or inflammatory rheumatism, sciatica or lumbago. One application drives out pain in a hurry.

Safe, healing, antiseptic —Gombault's Balsam has been the standby in many households for over forty years. No need to suffer if you keep this reliable liniment always on hand.

$1.50 per bottle at druggists or direct upon receipt of price.

AS A VETERINARY LINIMENT Gombault's Balsam also is the remedy which years of use have proved effective and safe for most horse ailments. Keeps your horses sound and working. The Lawrence-Williams Co., Cleveland, Ohio.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Telegony

Some old superstitions and erroneous beliefs are hard to "scotch" or eradicate in the minds of the people and many of these exist relative to the breeding of farm animals. We were reminded of that recently when we read with astonishment some incorrect advice given by an editor to a correspondent who asked for it before going on the witness stand to give expert testimony relative to the after effects upon a female animal of a previous conception to the service of an alien sire. It has long been held by many breeders that such a service taints or infects the womb and that the taint will appear in subsequent offspring by a sire of the female's own breed. This mistaken belief became the stronger when Darwin advanced what he believed to be conclusive corroborative evidence by quoting the unquestioned fact that a mare that had been bred to a quagga subsequently had a foal by a stallion of her own breed which showed stripes characteristic of her previous alien mate. There was no doubt as to the "off" markings. They might, however, be explained on the more rational basis that foals not infrequently show such markings, although of pure breeding. This is most liable to prove true of the foal of a mare tracing in blood to the Arab breed. "One swallow does not make a summer", neither does a striped foal, such as the one mentioned, prove the truth of alleged telegony.

Professor Cossar Ewart of Scotland, in the famous Penycuik experiments, crossed Shetland and other pony mares with zebra sires, in every possible combination, and exhaustively continued and repeated or checked the results and in not a single instance did any "taint" or "infection" result. The pony foals, by pony sires of the same breed as the mares, invariably showed only their true breed characteristics and color or markings, despite previous conceptions to the services of zebra sires. When off-markings appear in any animal they are not, therefore, correctly attributable to a previous mating with an alien sire, but are evidences of atavism, or recurrence of the characteristics of a remote ancestor. Such characters lie dormant or recessive in all animals of our so-called pure breeds and any one of them may "crop up" when a male and a female possessed of the same dormant character happen to be mated. That phase of the subject will be considered in another article.

On the witness stand an expert would have to state that telegony, or the influence on subsequent progeny of a previous alien impregnation, has no foundation; in fact, as has been proved by exhaustive and authentic experiments and that all instances of off-markings, in offspring of pure breeding, when an alien cross has previously occurred, are evidences of atavism or reversion to the lost characteristics of a remote ancestor.

When a scrub bull breaks into a pasture and serves a pure-bred cow and she consequently produces a scrub calf, that is an accidental injury for which the owner of the bull may, perhaps, be held responsible in law; but he cannot legally be made to pay damages for a supositous injury to the cow on account of the fictitious taint or infection of the womb to which we have referred as "telegony". The editor should have so informed his correspondent and, in giving instruction to the contrary, was plainly a "blind leader of the blind".

Barrenness

Do you know of any treatment that has proved reasonably successful in the treatment of cows that fail to get in calf? We have quite a valuable cow that has had four calves but have been unable to get her in calf since her last calving, nearly a year ago.
East Moline, Ill. A. H. B.

If the cow does not come in heat it will be necessary to have a veterinarian manipulate the ovaries, by way of the rectum, to rupture cysts or dislodge persistent "yellow bodies" (*corpus luteii*). If the cow comes in heat regularly but does not conceive when bred it is probable that there is an infected condition of the neck of the womb (*cervicitis*) or of the womb (*endometritis* or *pyometritis*). These diseased conditions necessitate local treatment with antiseptics and the employment of special instruments so that an expert has to do the work. Until one can be employed it would be well to keep the cow isolated and to syringe out her vagina two or three times a week with blood warm (100° F.) boiled water containing two tablespoonfuls of salt per gallon. It may be added that infection with the contagious abortion disease is a common cause of barrenness.

Sore Teats

Every fall I buy several carloads of milk cows in the north and ship them to our home place here. Almost invariably we have a large percentage of these cows develop sore teats; often, I believe, it gets the form of cowpox. Do you know of anything I can use on the teats before loading and on the trips, that will prevent this trouble?
Orlando, Fla. B. B. D.

We should advise you to cleanse the teats, each time before milking, with warm water containing one ounce of hypochlorite of soda or hyposulphite of soda per gallon. At time of shipping infection of the teats may be prevented by applying carbolized vaseline or oil 2 or 3 times daily. A wide bandage or string around the udder and body would also give the necessary protection but scarcely would be feasible for so many cows. Have the cows milked with clean, dry hands and keep floors clean to prevent fouling of the teats. Instantly isolate and milk last every cow that shows sores of cowpox on her teats. The stables should be cleaned, disinfected, and whitewashed, including the floors and gutters.

Louse Powders

Have tried every druggist in Chattanooga and can't find flowers of sulphur, sabadilla seed, and Persian insect powder. Druggists don't know what it is here. Please tell me where I can find them.
Alton Park, Tenn. M. Q. L.

Flowers of sulphur is the washed powdered or flower sulphur and is kept in stock by every druggist. Sabadilla is *veratrum sabadilla*, or *asagraea officinalis*, the Mexican variety. Your druggist can obtain it by writing to any wholesale drug house. Pyrethrum, Dalmatian, or Persian insect powders can also be ordered from such a firm and are kept in stock by most druggists.

MARSH FARM GUERNSEYS

Founded upon CHERUB blood, combining modern show type with production. At the last 13 National Dairy Expositions 46 out of 78 championships have been awarded to cattle from this farm. There are now in the herd 40 cows with yearly records of 500 pounds of fat in Class G. to 900 pounds of fat in Class A. In your efforts to improve the type of your cattle, the show ring records indicate Cherub blood as the really sure way. We will be pleased to advise with you about your next sire.

MARSH FARM - - - Waterloo, Iowa

LANGWATER QUEENLY A. R.

Do You Want the Best When You Buy a Herd Sire?

We are sure you do and that you will be interested in the son of Langwater Queenly we are now offering. "Queenly" produced 675 lbs. fat in Class E and 757 lbs. fat in Class A from 16,552 lbs. milk. He is sired by Langwater Star Gazer whose first daughter now on test is going at better than a 600-lb. rate in F. This calf will bring you both type and production and is priced very reasonably at $1000. The herd is accredited.

FLORHAM FARM, R. H. Allen, Mgr., Madison, N. J.

Ladysmith's Cherub and Gerar Pearl

We are line breeding to these two great individuals by using our herd sire CHERUB'S DART (out of PEARL'S DOT) on the seven head purchased at Mr. Stout's Sale.

CAUMSETT FARM, HUNTINGTON, L. I., N. Y.

2 SONS OF LADYSMITH CHERUB

The TYPE *Plus* PRODUCTION SIRE

ARE OFFERED FOR SALE. Both are serviceable, born in September, 1923, and are out of granddaughters of Beda's May King. One with a record of 590 lbs. fat in FF. The other died shortly after being started on test. Excellent individuals, nicely marked. PRICED AT $1,000 AND $500 respectively.

That most coveted place, 1st get of sire at the National, has been won 4 times in the last 6 years by the get of Ladysmith Cherub.

BUY LADYSMITH CHERUB BLOOD.

SHOREWOOD FARMS, CRYSTAL BAY, MINNESOTA.

This Blood Sells Fast!

Our bull calves are either sons of Anton's King Confidence or out of his daughters. They sell so rapidly that only in rare instances are we able to keep them until they are old enough for service. If you want a bull possessing this blood to head your herd, buy a calf six months' old, raise it yourself and save money. A. K. C. has gained a reputation for siring mighty good udders along with the other desirable characteristics. A bull of our breeding will make money for you and improve your herd.

Cow Testing Associations

(Continued from page 598)

was shown. The condensery paid $1.70 per cwt. for milk in October. The cheese factory paid 47c per lb. for fat.—M. H. Nelson.

Alma—Cochrane, Wis.: Thirteen members supplemented pasture with grain. Three feed silage. Twelve members weigh milk daily. One milk house was built and another is under construction.—E. R. Bailey.

Elroy, Wis.: Fourteen cows produced over 40 lbs. fat, three over 50 lbs. and three herds averaged over 30 lbs. fat last month. Milk retailed for 10c per quart.—A. G. Steffen.

Minnesota Has Ninety-two

HOARD'S DAIRYMAN:—In the October third issue of Hoard's Dairyman you gave a brief summary of our 1923 cow testing association activities in Minnesota. In this you stated that we had 40 associations. This is a bit misleading as on the 31st of December 1923, we had 72. Our summary reported that 40 associations could have rendered actual reports and of this number 29 submitted them. Thirty-two new associations were organized during 1923 and these added to the 40 which were already in operation brings the total to 72. At the present time there are 92 active testing associations in Minnesota which indicates that a steady growth has been taking place since the 1923 report was summarized.—E. A. HANSON.

Minnesota College of Agriculture.

Pennsylvania Associations

The Edinboro Association of Pennsylvania completed its year with 518 cows on test, their average production being 8449 pounds milk containing 310 pounds fat. There were 31 cows that produced over 400 pounds fat for the year, the high cow being a grade Holstein owned by G. S. Henry & Son that produced 16,604 pounds milk containing 600 pounds fat. There were 14 herds that averaged over 300 pounds fat with the Jersey herd of R. F. Divine taking first place with 449 pounds fat.

The Butler Association finished the year with 264 cows having an average production of 7047 pounds milk containing 296 pounds fat. The high herd, owned by Alex Martin, had a production of 10,092 pounds milk containing 405 pounds fat.—L. O. SIDELMAN.

Money's Worth Is the World's Best Bargain

THERE is no philanthropy in giving the consumer his money's worth, for it means satisfaction for him, for the dealer, the distributor and the manufacturer. Nor is there any lasting benefit in claiming to give him more.

This creed has won for the Warford Auxiliary Transmission more than 30,000 users whose enthusiasm for Warford comes from the fact that they got their money's worth.

When you select Warford, you get exactly what you pay for—a splendidly built selective type transmission—plus the confidence that it will meet every claim made for it.

In providing your Ford Truck with *six* speeds, Warford uses both under drive and *over* drive to give you two-ton capacity and pace making speed at Ford one-ton operating cost.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Volume LXVIII, No. 20 Fort Atkinson, Wisconsin November 28, 1924

Just Common Sense

FARM electrification, like farming itself, is a matter of common sense.

Farmers do not want electricity unless they can use it profitably.

But how can they learn to use it profitably? By experiment.

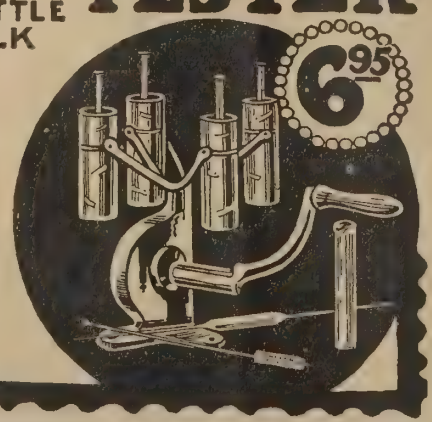
That is exactly what is now being done.

A National Committee of economists and engineers has organized state groups of farmers to whom electric service is now rendered. Each state group, with the assistance of its agricultural college and farm-paper editors, applies electricity in old and new ways. It keeps accurate records of operating and producing costs for comparison with the costs of unelectrified years. Electricity is being adapted to farming, and farming to electricity.

From time to time the results of these experiments will be made known. Farmers will not have to wait years before they can throw switches and fill silos electrically.

Even those farmers who have long had electricity, because their local conditions made it profitable to apply it, will receive the benefit. For they will see how they can make even greater use of electric service.

Thus the common-sense method of gathering the facts experimentally is helping along the work of farm electrification.



The Committee in charge of the work is composed of economists and engineers representing the American Farm Bureau Federation, the Departments of Agriculture, the Interior and Commerce, the Power Farming Association of America, the American Society of Agricultural Engineers and the National Electric Light Association.

A booklet has been published by the Committee. It will be sent on request free of charge. Read it and pass it on to your neighbor. Write for it either to Dr. E. A. White, American Farm Bureau Federation, 58 E. Washington St., Chicago, Ill., or to the National Electric Light Association, at 29 West 39th Street, New York City.

Wayside Musings

The Sower, The Seed, And The Soil

JOSEPH S. MORRIS, WISCONSIN

THE little girl was very near the mark, when she said that a parable is "an earthly story with a heavenly meaning".—W. M. Taylor.

How true! And how very, very many there are of these earthly stories with heavenly meanings. We are helped to the understanding of truths by descriptive and pictorial language. It would seem as if everyone who in any way attempts to teach would try always to use the simplest possible language to make it descriptive, to realize that we are all very busy people and that many times we miss much of truth because we haven't time to dig it out of language that conceals it.

The greatest art in the world is to get the great, enduring, character-building truths into the lives of people, for it is to good character that we must look for all progress of the future.

Jesus of Nazareth, the Galilean Peasant, continually resorted to "the earthly story with a heavenly meaning" and that is why the crowds lingered to listen while He talked.

There is nothing more difficult to listen to than advice which is given in a "preachy" manner. It may be the absolute of truth; we may know that it is the very thing we should heed, and yet, somehow, we are so constituted that when we are being "preached at", something within us revolts against it and we are not won over to the truth.

Jesus in His teaching usually left it to the hearer to reach his own conclusions. He presented the truth in story, in illustration, with a fine appeal, and always left the impression that men must themselves make the choice.

As He told the Parable of the Sower, men would be asking themselves "What kind of soil am I?" "How will the seed of good get along as it falls into my life?"

As the sower scattered the seed (it was by hand in Jesus' day), some of it fell by the wayside, upon the trodden-down, hardened ground. The birds of the air with keen eyes saw it and carried it away. Our lives may be the wayside soil, hardened by the struggle of life, tramped down by self-seeking and selfish living. Truths, however beautiful and saving they may be, may find it impossible to get a lodgment in our lives.

Some of the seed fell upon rocky places, places where there was shallow soil between the rocks. They found a lodgment, took root, grew up, but under the blazing heat of the day, when the moisture was exhausted, they withered away because they were not rooted deeply. In fine moments of life there come to us visions of high and noble purpose, ambitions for powerful, helpful lives. But everything that is strong and enduring and worth while has to stand a lot of opposition and testing. If the great, good emotions that come to us root deeply they will live and guide us.

And then, according to Jesus' story, some of the seed fell among thorns and the thorns grew and choked it. Those who read these words know how hard and how stubborn must be the battle against weeds. Character survives by a continual battle against "weeds" that get rooted in our souls. If there are untruths, bad thinking, hate, envy, jealousy, stubbornness growing in our characters, the truths which make for fine, broad manhood and womanhood will be choked out.

Then there is the good soil, the prepared soil. The seed took root, grew, multiplied, some thirty, some sixty, some a hundredfold. The good soil of the soul is made of kindness, justice, truth, self-control, reverence, brotherliness, and when the words of wisdom, of progress, of sanity, of clean living comes, it falls into the soul and takes root and grows. We are ready to grow into friendly and fruitful lives.

There are, happily, untold thousands of lives that are a blessing to themselves and to others. They have deliberately and painstakingly prepared to receive only the best and the best has grown in their lives and borne fruit.

What kind of soil am I? Am I open, receptive, eagerly waiting the ever-increasing light of truth and knowledge? Am I the prepared soil that can receive and make the most of all that is so wonderful in the age in which I live?

If all the "good soil men and women" of the world were written up in the newspapers and magazines there wouldn't be room for much else.

Farm Tenancy Studied in California

The California College of Agriculture has recently conducted some investigation concerning problems in farm tenancy and methods of leasing. The results of the investigation are published in Circular No. 272.

Those in charge of the work set up as the objective the following: 1, a study of the tenant situation as it affects the social and economic welfare of California; 2, a description of leasing methods in use in various agricultural sections of the state; 3, a suggestion concerning ways of determining proper division of income between landlord and tenant; 4, items to be considered in drawing up leases.

The conclusions drawn while of direct application to California conditions are not without pointed significance to other parts of the country. They are as follows:

"A state-wide policy looking to permanency in California agriculture requires that the place of the tenant be more accurately measured in the future than it has been in the immediate past, that conditions be improved for deserving tenants so that men may be drawn to the land who shall become social as well as economic assets, and, finally, that the land and all that it implies shall be given that consideration which will protect it from ruinous practices and short-sighted exploitation. Upon the welfare of its agriculture does much of California's prosperity depend."

Ayrshire Sets New Production Mark

South Farm Helen R., this year's National grand champion, completed her Roll of Honor requirements in the ownership of Adam Seitz & Sons of Wisconsin. In 300 days she gave 13,374 lbs. of milk, 498.05 lbs. fat; carrying a living calf 193 days of this period. This entitles her to the championship of the mature class of the Roll of Honor in this state.—Ayrshire Breeders' Association.

LESSONS FROM MY TRIP ABOUT DENMARK

J. MOLDENHAUER, CONNECTICUT

NOW I have been in Denmark over five months and surely have seen and heard much and many people of many kinds and in all stations in life, from plain town people and peasants to barons, counts, king, and queen! And truly I have enjoyed the talk and company of one kind just as much as of the other, and while I was glad again to see the hills, fields, seashore, villages, and cities and the immense progress made in all directions, still what has interested me most of all has been to get really acquainted with these Danes, my old countrymen, and to find them as a whole the most cheerful, friendly, and hospitable people I ever met anywhere—and that means a good deal. Of course, the Danes have their curious peculiarities and national faults, as all people have, but—that's another story! The fact is that every foreigner who behaves himself and doesn't brag too much of the superiority of his own land (we all know a little about that tendency), will be welcomed and shown every courtesy, no matter whether he is French or German, yellow or black! This will do for an introduction to what I really want to tell about, and I follow the good old rule, *"Strike while the iron is hot,"* and don't postpone.

Therefore I shall begin by telling about my last event, what I heard at a crowded meeting of dairymen from the country about Aarhus, that beautiful, prosperous, and fast growing city of 75,000 people, the capital of Jutland. The special cause of this gathering of so many busy farmers at 3 p. m. was the address by Professor Orla Jensen, the great bacteriological expert of Denmark, whose effort and investigations for years have been especially directed towards the dairy, the milk and its uses in all forms. He is a fair and conscientious investigator, who does not say or write things in order to please anybody or whoever would try to "grind his own ax", which we unfortunately find too many like to do—also in America! He also possesses that Danish characteristic of *"thoroughness"* and wants to be *sure* of a thing before he advocates it, and does not go off "half-cocked", which probably is one of *our* most dangerous tendencies.

You know how we all love to meet and hear people who agree with us! Thus you can well understand how pleased I felt when already at my first meeting with Professor Orla Jensen in Copenhagen I at once found that we so completely agreed on all principal milk questions, and more so especially in our ideas as to what ought and must be done in order to improve the quality of the supply of milk and cream for all cities, in America as well as in all other countries, and thereby again to gain the great object: to increase the use of milk in every form by all people. But while pleased to find such an eminent scientist from a theoretical and humane point of view to have reached the same conclusions which I, an old Danish-American milkman, have reached after half a century of practical experience—still it almost tickled me also to find that this Danish professor, which title means more abroad than in the United States, had the highest praise for the progress made in the United States along the lines of city milk supply, and considers the American cities generally to be far in advance of Copenhagen and other cities in Denmark! This same fact has also struck me, and wherever I have been I have taken pains to find out what the consumers and housewives over here think, and have always found a dissatisfaction with the milk and cream. A strange fact, indeed, when we know that Denmark absolutely holds the first place as a dairy country as well as a producer of the finest and best known products made of milk anywhere in the world.

What, then, can be the reason of this Danish backwardness regarding that most important question, milk for consumption? Partly, I think, it is caused by that dangerous disposition in all men: To rest upon old laurels! When we human beings a long time have been told about our great virtues and accomplishments, we are apt to forget that progress is necessary everywhere; if not, stagnation shall take its place. But when Denmark years ago found that some radical steps had to be taken in order to put a halt to the spread of tuberculosis among the dairy herds as well as all stock generally, it was found that the most practical and effective method would be the thorough pasteurization of all skimmilk supplied from the creameries for the feeding of stock on the farms. This system was soon adopted and made compulsory by law—the laws, by the way, are always enforced in Denmark—and the results have proven most effective, and the spread of tuberculosis through infected skimmilk and buttermilk has been checked. But in order to enforce a law it was necessary to find a test by which it could be easily proven that all milk sent back from the creameries had been heated sufficiently to guarantee the destruction of all tubercular germs. It was then found that even a momentary heating of milk and cream to at least 85 Centigrade (185° F.) was necessary so to change the milk that a simple test would change the color of the milk only if it had been sufficiently heated. So this temperature was adopted by law, and has been practiced ever since in all Danish creameries, both for the skimmilk and for the cream used for buttermaking, so that the buttermilk became equally safe for all feeding purposes. Fortunately this high heating did not have any bad effect on the butter when the pasteurized cream afterwards was ripened by the addition of a uniform starter, but on the contrary has played an enormous part in producing a butter not only of excellent character but of such keeping quality and uniformity which is unequalled in any other country. What is good for the goose is not always good for the gander.

It may be that the stomachs of people and pigs are very much alike, but civilization has made us finicky in our taste, and so it happens that most people dislike the taste and smell of such high pasteurized milk and while the laws of Denmark prohibit calves and pigs from drinking cows' unpasteurized milk, the people everywhere are still allowed to drink and eat milk raw and the natural result is that yet today the people of Copenhagen generally drink raw milk, which, while very cleanly handled, still not only has a poor keeping quality (gets sour too soon) but cannot be guaranteed as being safe, not only as to presence of tubercular germs, but also as to infection from the many other most common diseases so dangerous both for children and adults.

I have gone rather more into these details because it will explain Professor Orla Jensen's point of view and fixed convictions better. It also is interesting to find that the Professor already by his researches and experiments in Copenhagen had reached the conclusion that when milk was heated even as low as to 60° Centigrade (140° F.) only, but was kept at that temperature for 30 minutes, would destroy all objectionable germs as fully as the higher temperature 85° Cent. for momentary exposure. But when Professor Jensen visited the International Dairy Congress in the United States, he was surprised to find how this system already had been so universally adopted for many years and with such great success. So he became more confirmed than ever that low pasteurization, as it is called in Europe, absolutely is the only practical method to secure a safe and satisfactory milk supply for cities—at least until something still better may be invented.

The professor also had become much interested in the so-called "Dairy Council" as has lately been organized in the eastern part of the United States and he has already succeeded in forming a similar organization in Denmark, with the important final object to increase the use of milk in all forms. It certainly must please us in the United States that a so far advanced dairy country as Denmark still may learn something from us. Only let us not forget that we can

(Continued on page 620)

UNION STAR CHEESE FACTORY

FOR several years the Marschall Dairy Laboratory of Wisconsin has offered prizes to Wisconsin cheese factories for neat and attractive surroundings. The above illustration is of the Union Star Cheese Factory, winner of the first prize in this contest. The prize is not offered for the most expensive or elaborate cheese factory, but for neat and attractive surroundings.

The Wisconsin cheese industry would render itself a splendid service if every cheese factory in the state would take more pride in outside appearances. This state is visited by many tourists and if every cheese factory they passed had plants and flowers and well kept grounds surrounding it, and the factory well painted and otherwise in neat condition, it would be one of the biggest advertisements we could give our cheese. A cheesemaker who looks after the outside appearances of his factory and takes pride in it is also a better cheesemaker. He requires better milk from his patrons and he exercises more care in the manufacture of his cheese.

Pacific International Live Stock Exposition

F. L. BALLARD, OREGON

THE 14th Annual Pacific International Live Stock Exposition held in Portland the week ending November 8th, reaffirmed the spirit of the Pacific Coast and its faith in better live stock.

When on July 23rd the entire plant housing the exposition was burned to the ground, it for a moment seemed that this distinctive live stock show was temporarily at an end. But only for a few minutes, however. Before the ashes were cool, press announcements went out bearing word that reconstruction would at once begin and a replica of the destroyed plant would be ready for use November 1. And it was. In fifty-eight working days a new building was finished and in it were all the conveniences of the first structure and many features of added convenience as well. An additional acre was enclosed making more room in the arena and in the barns, providing particularly for increased accommodations for the boys' and girls' club exhibits which have from the first been an annually increasing phase of the exposition. Around the enlarged arena the increased seating space was freed of obstructing pillars.

AIRPLANE VIEW OF THE PACIFIC INTERNATIONAL EXPOSITION PLANT REBUILT IN 58 WORKING DAYS FOLLOWING COMPLETE DESTRUCTION BY FIRE JULY 23, 1924

Fire was not the only untoward development encountered by the show this year. With California ravaged by foot and mouth disease, entries from the South were closed; with drouth prevailing over all the West and the fire occurring just as fitting for the show was to start, conditions were not favorable. In fact, many Northwest shows including the Washington State Fair were cancelled.

MANAGER O. M. PLUMMER HOLDING THE GRAND CHAMPION HOLSTEIN COW OF THE PACIFIC INTERNATIONAL LIVE STOCK EXPOSITION, MADAM ARTIS WAYNE DENVER, OWNED BY JEFFERSON COUNTY ASYLUM, WISCONSIN

The Pacific International covers a wide field. Not only is it a dairy show of first rank but as an exhibition of beef cattle, horses, sheep, and hogs it also holds a front place. Connected with the show is a Northwest Land Products Exposition, a large industrial exhibition, and the Western Winter Poultry and Pet Stock Show. The night horse show is an event of every evening and late in the week, after the judging is completed, matinees are scheduled.

The premium list this year totaled $90,000 in cash prizes. In addition there was an unusually long and valuable list of special trophies awarded by commercial and agricultural organizations.

The greatest improvement in live stock exhibits this year was noted in the draft horse classes. Not only were draft horses shown in greater numbers than for several years back but the high class of the entries was heretofore unattained. The sheep classes were also strong. Hogs showed great improvement in quality of exhibits and remained about as in previous years in numbers. Beef cattle were shown in approximately the usual number and the quality was about on former levels.

The dairy show, as from the first, reflected the advancement of the Pacific Coast in the dairy industry. In the territory immediately surrounding the show, dairying has made marked progress in recent years. Government reports indicate that the cows of Washington are the highest producers of those of any state. Oregon has a major share of the production records in the Jersey breed; in fact, holds more world's records than any other state. In Idaho the dairy cow is being recognized as the hub around which diversified farming is being developed. More bull associations have been organized in Idaho recently than in any other state. British Columbia is increasing its dairy industry; likewise California, where rapidly increased population is providing ready markets.

The dairy show this year in general equalled expectations. Many entries were from the herds of new breeders who are starting modestly with a small number of good individuals. The dairy products show was stronger than usual, featured by good numbers of entries of butter, cheese, and market milk.

The Land Products Show maintained its quality. The potato display, while decreased in total entries, made high advancement in quality. Certified seed displays and excellent bushel entries of market stock were the features. The state experiment stations made suitable displays and a large space was devoted to an exhibit by Oregon Agricultural College. Agricultural counties sent representative exhibits. There was no competition among these entries. Hood River County, Oregon, sent an outstanding exhibit of apples. Coos County, Oregon, presented a booth featuring cheese and myrtle wood products.

In the industrial department the United States Department of Agriculture, in tastefully arranged booths, depicted different lines of effort. The Bureau of Dairying brought out the value of better feeding, improved breeding practices, and sanitary methods of handling milk. The Forest Service, Biological Survey and Bureau of Public Roads brought to light appropriate facts regarding work in progress.

The Holstein-Friesian Association maintained official headquarters in a space 10x40 feet in the industrial department and distributed literature and furnished Holstein milk. Fred A. Koenig, head of the association's extension service, and W. E. Meyer, fieldman for the Northwest, were in charge. The Jersey breeders had feature displays in the dairy barn. Darling's Jolly Lassie, world's champion producer, owned by Ovid Pickard, occupied an especially well decorated box stall. The Guernsey Association presented a rest room for Guernsey enthusiasts. In charge of this feature was E. L. Westover of the field staff.

Boys' and Girls' Clubs

Exhibits of boys' and girls' club members have always been a popular feature of the exposition. Here is afforded a fitting climax to the year's work and winners in county competitions in the northwest states, particularly, meet for final competition. Most of the entries would stand creditably in open classes and here and there is found an individual which would win. Junior exhibitors this year showed sixty-five dairy animals, forty sheep, thirty-two beef animals, five colts, and 285 hogs. The colts were shown by a club from Adams County, Washington.

Thirty-three county teams entered the stock judging contests. All classes of live stock were placed. First place went to Marion County, Oregon. Members of the team are Homer Bray, Eldon Fox, and Lyle Rains. Other leading teams were Kittitas County, Washington; Linn County, Oregon; Union County, Oregon; and Adams County, Washington. Homer Bray of the winning team was high ranking individual attaining a score of 800. Dan Reaugh of Grant County, Washington, pressed closely with 795. Morris Johnson and Lester Blockland, both members of Oregon teams, were tied at 785 and Clarence Smith of Lewis County, Washington, made a score of 775. Professor Gordon H. True of the University of California had charge of the judging contest.

Twenty-five teams from Smith—Hughes vocation high schools entered a live stock judging contest arranged especially for students in Smith—Hughes courses. Newberg, Oregon, sent the high scoring team. Twin Falls, Idaho, presented the second place winners. Other teams in order were from Ontario, Oregon; Pullman, Washington; and Imbler, Oregon. Ted Sievers of the Filer, Idaho, team was highest scoring student and won a gold medal. Albert Murphy was second. Others toward the top were Roland Sheedeen, Virgil Starr, and Russell McKennon of Oregon. R. J. Werner of the California Department of Education had charge of the contest.

In the college judging contest—all breeds of live stock—University of California was first with a score of 4,376. The other teams placed as follows: Washington State College, Uni-

GOVERNORS W. M. PIERCE, OREGON, (LEFT) AND L. F. HART, WASHINGTON, DRINKING HOLSTEIN MILK AT THE HOLSTEIN BOOTH

versity of Idaho, Montana State College, Oregon Agricultural College, University of British Columbia.

Individual leaders were: Hector McDonald, Washington State College, 915; Walter C. Leth, University of Idaho, 910; Elizabeth Graves, University of California, 906; Milton Johnson, University of Idaho, 904.

Students' Dairy Judging

By virtue of winning first and second in judging Holsteins and a second place in Ayrshires, the University of Idaho team took first rank in the college students' judging contest, an annual event held under the direction of the Western Dairy Instructors' Association. Gold medals are offered by the association to the three students making the highest scores. H. W. Thulin of the winning team was high man with a total of 1,182 points out of a possible 1,500. Henry P. Dykstra of Washington State College was second with 1,141 and Robert E. Osborne of University of California, third with 1,132. Mr. Osborne was first in judging Ayrshires and Guernseys. Mr. Thulin was the most accurate judge of Holsteins and S. J. Curtis of Washington State College was the best judge of Jerseys.

Members of the winning team were: H. W. Thulin, David Fales, and Dan Warren. Professor F. W. Atkeson coached the team. The remaining four teams finished as follows: Washington State College, Oregon Agricultural College, University of California, University of British Columbia.

The Ayrshire Breeders' Association gave a silver cup to the best team in judging Ayrshires; this was won by the University of Idaho. The American Guernsey Cattle Club plaque was taken by the University of California. The Holstein-Friesian Association offered a silver cup which was taken by the University of Idaho. A silver cup is likewise offered by the American Jersey Cattle Club and this year it went to the team from Oregon Agricultural College.

The same institutions entered teams in judging of dairy products. Oregon Agricultural College took first and one of its team, H. B. Aldrich, was high man in the competition which included placing of butter, cheese, and market milk. The University of Idaho team was second in the composite score and took first in cheese placing. The team from University of California was the best group in the scoring of market milk. Clarence Fales of University of Idaho was second man in the contest and C. L. Lockhart, Oregon Agricultural College, third. All three were awarded gold medals.

The usual number of meetings of breed associations and other agricultural groups were held during the week. Chief in interest was the meeting of the exposition stockholders. E. A. Stuart of Carnation Farms was re-named president and O. M. Plummer was continued as secretary and general manager. The breed associations held banquets and short business sessions. The Oregon Buttermakers' Association met in annual convention as did the Oregon Horticultural Society. The Portland Chamber of Commerce entertained the boys' and girls' club participants with a banquet.

Dairy Sales

Low prices prevailed at the Holstein and Jersey sales. On election day voters of both Oregon and Washington registered disapproval of "anti-oleomargarine" laws and these decisions were thought to have seriously depressed the bidding. Eighty-seven Jerseys were listed for the sale but because of inactivity around the sale ring some were withdrawn. Approximately 65 were sent through to make up a sale average of $172 with a top of $785. The Holstein sale dragged on about the same level. Sixty-five individuals drew out an average of $167. The top was $525.

At the Jersey Association meeting resolutions were passed pledging renewed effort along educational lines looking to another fight on the dairy substitute question.

The Dairy Cattle

The dairy show was this year predominantly a Holstein show. The black and white led in numbers and quality. Eleven exhibitors from Wisconsin added interest and tone to the very excellent entry list. In fact, the Pacific International this year attracted such a galaxy of quality stock as to mark it one of the top Holstein shows of the year. Numbered among the forty-seven exhibitors were many small breeders, some of whom attained enviable positions in the placings on their entries. Throughout the dairy barns, in fact, was evidence of the role the show has filled as a "Live Stock University" in the dairy industry since dairy cattle last were admitted in 1918. Small breeders showing year after year indicate marked advancement in quality and finish of exhibits. The Holstein display evidenced the efforts of the extension service of the national association which has been very active in the Northwest for two years.

The Guernsey entries were more uniform than in past seasons but in numbers the breed was light. This popular breed has been making steady progress on the Pacific Coast but in past shows in Portland there have been wide variations in quality. Therefore the uniform excellence of the Guernseys this year is an encouragement. Jersey classes were fairly well filled but this part of the show fell far short of measuring up to its possibilities considering the position the home state of the exposition holds in the Jersey world. One class was so mediocre that the judge would not place a blue ribbon. No greater improvement in the dairy department of the exposition could be made than the assembling regularly for a period of years of a Jersey line-up in keeping with the quality of the Jerseys on the coast. Ayrshires maintained about the same level in numbers and character and Brown Swiss showed some decrease in entries. The latter breed has not as yet made much headway on the Pacific Coast. The best herd in the Northwest, that of W. O. Bohart, Montana, was not entered this year. All in all, the dairy department maintained its standards by virtue of the Holstein entries. Undoubtedly the unfavorable conditions of the season had a depressing influence on the show.

The judging was very satisfactory. There was an entire absence of disapproval. In fact, many commendatory expressions were heard.

JOHANNA RAG APPLE PABST, SENIOR AND GRAND CHAMPION HOLSTEIN BULL
OWNED BY J. E. PIEK, WISCONSIN

BOOTH OF COOS COUNTY, OREGON, FEATURING MELOWEST CHEESE MADE IN THAT COUNTY

Holstein-Friesians

Forty-seven exhibitors made 336 entries of Holsteins and brought about the only increase in numbers among the breeds. The line-up was generally declared the best the show has seen. Interest was increased by the presence of eleven exhibitors from Wisconsin, a new departure in the Holstein show. The eastern entries were recipients of a generous share of the awards. Carnation Farms, Washington, was the largest single exhibitor. For the first time Oregon exhibitors exceeded Washington in number. Washington has always shown a strong preference for the black and white and several famous herds have been developed there. Some of these were missing this year, due largely to the fact that most of the fall fairs and shows in Washington were cancelled and breeders were not fitting for the one show at Portland. The Oregon herds represented were generally small herds but indicated their quality by substantial positions in the awards.

The classes were generally strong with perhaps more uniform strength shown among the younger animals. The senior yearling heifer group was about the hardest class to place. Out of this group came the junior champion, Johanna Wayne Rue 2nd, entered by the Jefferson County Asylum, Wisconsin. This heifer was given a close run, however, by a dandy heifer, Hazelwood Fobes Heilo, entered by John L. Smith of Washington. A Carnation heifer took third place. The junior yearlings also had a close line-up with a daughter of Matador Segis Walker taking the blue in a close race with Lady Johanna Pontiac Rag Apple 3rd, a Wisconsin heifer, entered by Philip Linker. An interesting class was aged bulls. Matador Segis Walker 6th, long time grand champion of the exposition, his show days over, went down to third place, while the blue was taken by Sir Florence De Kol Soldene, an excellent bull from the little herd of Blair & Sandwick, Oregon. Second place went to a Wisconsin bull, Maple Row Sarcastic Lad, owned by the Jefferson County Asylum. The three-year-old bulls were strong. Although there were but four entries this class produced the grand champion, Johanna Rag Apple Pabst, entered by J. E. Piek, Wisconsin. The two-year-old bulls brought out a good individual in Phymire King Fobes from the herd of Dr. W. P. Phy, Oregon. When the aged cows were called, twenty entries responded and made up a strong class in which the first twelve were strong individuals. First place was taken by Agricultural School Farm, Wisconsin, on Barbetta Hengerveld De Kol. The four-year-old cows were not particularly strong. The next class produced the grand

champion, Madame Artis Wayne Denver, of the Jefferson County Asylum herd that had taken similar honors at the National Dairy Show. The 2-year-olds brought out a strong individual that was runner up for senior championship honors in Jenny De Kol Segis Walker owned by Anton Vandecoevering, Oregon. The groups were strong. John L. Smith won permanent possession of the $1,000 trophy presented by Holstein breeders of the East, who were guests of the exposition in 1921, for the best produce of dam. For permanent possession it was necessary to win twice. Carnation Farms won in 1922 and the Smith entries last year and again this year.

Recapitulation shows Carnation Farms the heavy winners with five firsts, nine seconds, and seven thirds. The Jefferson County Asylum herd was next with seven firsts, one second, and three third places.

Judge—Ward W. Stevens, New York

Exhibitors: Carnation Milk Farm, Hugh Nisbet, John L. Smith, H. J. Evans, Thos. Yarr, C. H. Hennings, J. W. P. Dunlap, R. A. Anderson, James C. Chamberlin, A. H. Buck & Ed. Hoem, H. R. Shoultes, Washington; Dr. W. T. Phy, F. W. Durbin & Son, E. P. Lindow, John A. Lindow, P. A. Frakes, George E. Frakes, Adolph Benter, T. L. Sweany, Jr., Chris Siegenthaler, Adams' Eden Farm, Albert J. Evers, Jack Mowry, F. R. Beals, J. Luscher & Sons, Roy E. Stevens, J. P. Vandecoevering & A. J. Evers, J. P. Vandecoevering, Anton Vandecoevering, George A. McCart, Wm. McKeown, J. F. Peerenboon & Albert J. Evers, Joseph Erickson, Maracci & Cuzzolin, Blair & Sandwick, Charlie Melson, Oregon; Jefferson County Asylum, Baltz Hoesly, Pabst Holstein Farms, Carnation Milk Farms, Philip Linker, G. Keyes, H. E. Dickenson, Agricultural School Farm, Christ & Hackbarth, John Zoberlin, Wisconsin.

The awards are as follows:

Bull 4 years old or over—1, Blair & Sandwick on Sir Florence De Kol Soldene; 2, Jefferson County Asylum on Maple Row Sarcastic Lad; 3, Carnation Farm on Matador Segis Walker. Bull 3 yrs. old and under 4—1, Piek on Johanna Rag Apple Pabst; 2, F. W. Durbin on Sir Walker Inka Homestead; 3, E. P. Lindow on Twin Fir Sir Bos. Fayne. Bull 2 yrs. old and under 3—1, Dr. W. T. Phy on Phymere King Fobes: 2, Carnation on Sandy Segis Walker Matador: 3, Charlie Melson on Sir Florence Pietertje Sharp. Senior yearling bulls—1, Carnation on Harvest Jewel Matador: 2, Beals on Tidy Colantha Whiteness: 3, P. A. Frakes on Tidy Statesman. Junior yearling bulls—1, Jefferson Co. Asy. on King Mutual Fan: 2, Wm. McKeown on Segis Walker Matador Mechthilde: 3, H. R. Shoultes on Sir Adns. Perfection. Senior bull calf—1, Christ & Hackbarth on King Richmond Pontiac: 2 and 3. Carnation on Walker Lilith Colantha and Alfred George Matador. Junior bull calf—1, John Zoberlin on General Homestead Mercedes; 2, Adams Eden Farms on Adamseden Meth. Segis; 3, Jefferson Co. Asy. on King Waldorf Inka Lyon.

Cow 5 years old or over—1, Agricultural School Farm on Barbetta Hengerveld De Kol; 2, Carnation on Tillamook May Boon De Kol; 3, Adolph Benter on Esther Hengerveld Antonia. Cow 4 years old and under 5—1, Dickenson on Dolly De Kol Tirania Fayne; 2, Beals on Bessie Princess Snowball; 3, Jefferson Co. Asy on Charity Canary Denver. Cow 3 years old and under 4—1, Jefferson Co. Asy. on Madam Artis Wayne Denver; 2, Carnation on Carnation Matador Ourvilla; 3, Chamberlin on Laurie Prilly of Cerealia. Heifer 2 years old and under 3—1, Anton Vandecoevering on Jennie De Kol Segis Walker; 2, Beals on Nancy Active Tillamook: 3. Carnation on Carnation Matador Mercedes Selah. Heifer 2 years old and under 3—1 and 2, Carnation on Queen Pontiac Matador and Segis Matador Bonnell; 3, Chamberlin on Harriet Waldorf Boon Cerealia. Senior yearling heifer—1, Jefferson Co. Asy. on Johanna Wayne Rue 2nd: 2. Smith on Hazelwood Fobes Heilo; 3, Carnation on Carnation Pauline Matador. Junior yearling heifer—1, Carnation on Carnation Matador Aaggie Colantha; 2, Linker on Lady Johanna Pontiac Rag Apple 3rd; 3, Smith on Hazelwood Segis Bonheur. Senior heifer calf—1, Jefferson Co. Asy. on Empress Susie Waldorf; 2, Carnation on Carnation Matador Lulu Segis; 3, Smith on Hazelwood Segis Ormsby. Junior heifer calf—1, Smith on Hazelwood Heilo Skylark 2nd; 2, Linker on Lady Nettie Pontiac Star 2nd; 3, Carnation on Carnation Prospect Gem.

Cow having official yearly record begun at 5 years old or over—1, Beals; 2, Evans; 3, Carnation. Cow having official yearly record under 5 years of age—Adolph Benter and Jefferson Co. Asy. each entered cows scoring 95%; 2, Evans; 3, Evers and Jefferson Co. Asy. A. R. cow with two progeny owned by exhibitor—1, Carnation; 2, Beals; 3, Chamberlain. Get of sire—1, Jefferson Co. Asy.; 2, Smith; 3, Carnation. Produce of cow—1, Smith; 2, Chamberlain; 3, Carnation. Exhibitor's herd—1, Jefferson Co. Asy.; 2, Carnation; 3, Chamberlain. Young herd—1, Jefferson Co. Asy.; 2, Carnation; 3, Smith. Calf herd—1, Carnation; 2, Smith; 3, Jefferson Co. Asy. Dairy herd—1, Beals; 2, Carnation; 3, Evans.

Senior and grand champion bull—Johanna Rag Apple Pabst. Junior champion bull—King Mutual Fan.

Senior and grand champion female—Madame Artis Wayne Denver. Junior champion female—Johanna Wayne Rue.

The special prize for state herd went to Wisconsin. Washington took second place and Oregon third.

The Matador Segis Walker Trophy was won by the Jefferson County Asylum.

Jerseys

The Jerseys, second in numbers, were something of a disappointment to the ringside. Twenty-four breeders exhibited two hundred individuals which ranged from a strong group in the senior bull class down through a very ordinary group of older cows into a considerably better showing in the younger classes. On the whole, the bulls this year were much better than the females, a complete reverse of the situation prevailing for two years past. The younger classes brought out some promising growthy young stuff which will be favorably heard from later on. The best bull class was the aged group in which Noble's Majesty of L took first place and then went on to the senior and grand championships for the third time. This remarkably good bull has been grand champion three times at the Pacific International. Last year he was runner-up, but was finally beaten out by a narrow margin. This bull is a stylish show bull of American breeding and is a creditable representative of the breed. He heads the small herd of J. M. Heldt, Washington, and interest this year attached to a few of his daughters who did fairly well in the competition but did not measure up to the distinction of their sire. Second place went to Foxhall's Chief Engineer, another good bull, but lacking the easy refinements of the winner. The bull classes were then rather ordinary until the senior bull calves were brought out. This was a good sized class of typy youngsters and competition was close. The junior bull calves made up another good class, the blue ribbon going to an unnamed March calf. Another promising calf in this group was St. Mawes Beauties St. Mawes shown by D. C. Howard.

The aged cows were very ordinary with the exception of the first place winner, Imp. You'll Do Fannie, shown by Pickard Bros. The winner in the next class could only make second at the Oregon State Fair and in the three-year-olds no first place was given. The young female classes were rather uniformly good. The cows having official yearly records begun under five years of age were a strong group and the selection was close. St. Mawe's Oxford Lady from the comparatively recent herd of D. C. Howard took first place. In get of sire, the first place group of L. G. Smith was a good one. The four entries displayed uniformly a wealth of Jersey character and all together made up a very promising group. Another strong group was the young herd of F. E. & C. F. Bates, Oregon. Competition was close in this class which however had but four entries. An imported cow, Imp. Broadland's Lady, was grand champion female in a very close race. She is a little smaller than some of the Jerseys that have been popular in the Northwest but was exceptionally smooth and showed a world of quality.

Judge—Professor F. W. Atkeson, University of Idaho

Exhibitors: L. G. Smith, Fox Bros., V. S. Abraham, M. K. Abraham. E. L. Power, Frank B. Davis, D. C. Howard, Kenneth A. Kesterson, J. L. Bowman, D. B. Yoder, Lewis E. Judson, Will Behrmann, Jr., Pickard Bros., T. H. Acree, Lester R. Campbell, Ed. Schoel, Crandall & Linn, F. E. & C. F. Bates, K. Hanneman, A. W. Agnew, Oregon; A. J. Firkins & Son, Idaho; J. M. Heldt, O. P. Dosland, W. W. Howard, Washington.

The Jersey awards are as follows:

Bull 4 years old or over—1, Heldt on Noble's Majesty of L; 2, Fox Bros. on Foxhall's Chief Engineer; 3, Behrmann, Jr., on Carry On of Oregon. Bull 3 years old under 4—1, Howard on Captain Tristrams St. Mawes; 2, Abraham on Popelora's Golden Pogis. Bull 2 years old and under 3—1, Crandall & Linn on Glen Tana Morocco Majesty; 2, Bowman on Halcyon's King of Oregon. Senior yearling bull—1, Fox Bros. on Imp. Eagle's Double Boy; 2, Behrmann on La Creole's Golden Pogis; 3, Davis. Junior yearling bull—1, Firkins & Son on Nutwood Count; 2, Acree on Rex of Valhalla. Senior Bull Calf—1, Smith on Chimes Fussy Clair Val of S. B.; 2, Pickard Bros. on Glow's Tiddledywink Syracuse; 3, Bates on Unnamed. Junior bull calf—1, Bates on Unnamed; 2, Howard on St. Mawes Beautie St. Mawes; 3, Davis on Captain Tristram's Image.

Cow 5 years or over—1, Pickard Bros. on Imp. You'll Do Fanny; 2, Crandall & Linn on Imp. Jersey Volunteer Bess; 3, Bates on Luckiamute's Hope. Cow 4 years old under 5—1, Crandall & Linn on Imp. Broadland's Lady; 2, Howard on St. Mawes Suzette of M. L. P.; 3, Pickard Bros. on Vive La France III; 4, Howard on St. Mawes Lad's Oxford Lady. Cow 3 years and under 4—(No first awarded) 2 and 3, Bowman on Halcyon's Blue Bell and Halcyon's Buttercup. Cow 2 years old and under 3—1, Crandall & Linn on Imp. Xenia's Oxford Lady; 2, Howard on Dream of St. Mawes; 3, Bates on Belle of Rich Lea. Senior yearling heifer—1, Howard on St. Mawe's Blossom's Gelatine; 2 and 3, Hanneman on St. Mawe's Marcia and St. Mawe's Silent Glow. Junior yearling heifer—1, Bates on Lorita's Princess; 2, Behrmann, Jr., on La Creole's Daisy Bell; 3, Schoel on Oxford's Glow. Senior heifer calf—1, Crandall & Linn on St. Mawe's Gypsy Rose; 2, Howard on St. Mawe's Rosaires Dollie; 3, Smith on Chimes Pearl of S. B. Junior heifer calf—1, L. Power on Rosaire's Noble Twin; 2, Heldt on Unnamed; 3, Ed. Schoel on Oxford's Betty D.

Cow having official yearly record of 5 years or over—1, Behrmann, Jr., on La Creole's Saviour Bell; 2, Hanneman on Poet's Mabel Mowat. Cow having official yearly record begun under 5 years of age—1 and 2, Howard on St. Mawe's Oxford Lady and Noble's Tinkler's Mabel; 3, Hanneman on Plymouth's Yockey. Advanced Registry cow with two of her progeny—1 and 3, Behrmann, Jr., on La Creole's St. Saviour's Bell and Lillys Pet Mabel; 2, Hanneman on Poet's Mabel Mowat. Get of sire—1, Smith; 2, Schoel; 3, Bates. Produce of cow—1, Howard; 2, Crandall & Linn; 3, Hanneman; 4, Behrmann, Jr. Exhibitor's herd—1, Crandall & Linn; 2, Bates; 3, Howard. Young herd—1, Bates; 2, Schoel; 3, Howard. Calf herd—1, Power; 2, Abraham. Dairy herd—1, Crandall & Linn; 2, Howard; 3, Behrmann, Jr.

Senior and grand champion bull—Noble's Majesty of L. Junior champion bull—Imp. Eagle's Double Boy.

Senior and grand champion female—Imp. Broadland's Lady. Junior champion female—Loritta's Princess.

JEWEL OF ROSE CITY, SENIOR AND GRAND CHAMPION GUERNSEY COW
OWNED BY A. L. GILE, WASHINGTON

WEISER'S KING TOM, SENIOR AND GRAND CHAMPION GUERNSEY BULL
OWNED BY H. J. WEISER, WASHINGTON

Guernseys

An even dozen exhibitors made up a showing of about 85 head of Guernseys. This number is not up to the standard of the Pacific International but the general tone of the entries was good. The tops, in general, perhaps, were not as outstanding as has been the case in some years, but as an offset, there was an entire absence of ragged stuff. The result was a very uniform showing with quality very well distributed through the classes. The aged cows were good. Jewel of Rose City, twice previously grand champion cow, worked up again through this class to another grand championship. It was this group also that produced the runner-up, Queen Zeffrys Edgemoor Girl, owned by G. M. Vetter, Washington. This cow had not received the advantage of extensive fitting for the show as she was running on pasture up to the time entries were made and became a last minute entry and the surprise of the female classes. The senior heifer calves made up another good class and brought out some close competition.

Several good small herds established in recent years did not show this year owing to the abbreviated circuit in the West. Albion L. Gile won a large proportion of the first and second awards. He took three of the championships, winning senior and grand championship on Jewel of Rose City, junior championship on Lavender Chicona, and took the junior championship bull award on Chicona Joseph Pride, a splendid young individual. H. J. Weiser, Washington, showed the senior and grand champion bull, Weiser's King Tom, a bull with a nice top, splendid head, and good depth.

Judge—E. V. Ellington, Washington State College

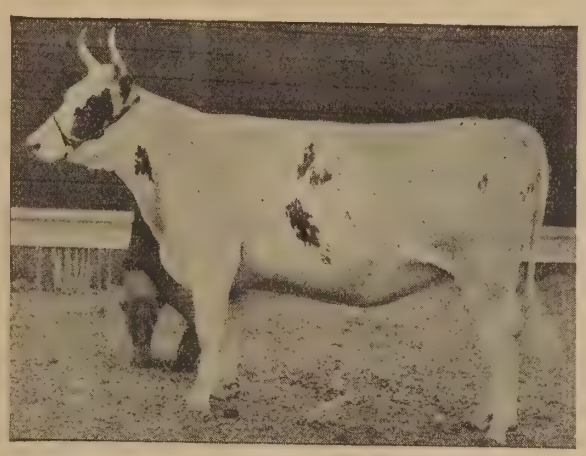
Exhibitors: D. J. Elliott, Francis Hughes, Leo Farr, P. C. Adams, Springbrook Farm, G. Mitzner & Son, Oregon; Valley Gem Farms, Hal Bisnett, H. J. Weiser, G. M. Vetter, John Olson, Albion L. Gile, Washington.

The awards are as follows:

Bull 4 years old or over—1, Weiser on Weiser's King Tom; 2, Gile on ———. Bull 2 years old and under 3—1, Mitzner & Son on Keewaydin's Jolly Fermain; 2, Valley Gem Farm on Valley Gem Paragon. Senior yearling bull—1, Elliott on Summerfield's Victor. Junior yearling bull—1, Gile on Chicona Joseph Pride. Senior bull calf—1, Valley Gem Farms on Mixter Senator; 2, Valley Gem Farms on Unnamed; 3, Gile on Chicona Puck. Junior bull calf—1, Gile on Chicona Dumas; 2, Springbrook Farm on Spotlight's Hero of Springbrook; 3, Valley Gem Farms on Valley Gem Pagan.

Cow 5 years old or over—1, Gile on Jewel of Rose City; 2, Valley Gem Farms on Gana of Valley Gem; 3, Weiser on Park's Auvaleen. Cow 4 years old under 5—Vetter on Queen Zeffry's Edgemoor Girl; 2, Francis Hughes on Red Wing Doctor Phillips. Cow 3 years old and under 4—1, Gile on Sunlight of Chicona; 2, Valley Gem Farms on Lishman's

Nancy of Valley Gem; 3, Valley Gem Farms on Lishman's Gana of Valley Gem. Cow 2 years old and under 3—1, Vetter on Lady Glenwood of Littlebrook; 2, Gile on Starlight of Chicona; 3, Springbrook Farm on Victoria's Beaty of Springbrook. Senior yearling heifer—1, Gile on Carmen of Chicona. Junior yearling heifer—1, Gile on Maybelle of Chicona; 2, Mitzner & Son on Molalla Boy's Lassie; 3, Bisnett on Princess Lilly of Nobles Farm. Senior heifer calf—1, Springbrook Farms on Jennie Daisy of Springbrook; 2, Bisnett on Hazel of Nobles Farm; 3, Gile on Janella of Chicona. Junior heifer calf—1, 2, and 3, Gile on Lavender of Chicona, Lucretia of Chicona, and Derinda of Chicona.



Cow having official yearly record begun under five years—1, Gile on Jewel of Rose City; 2 and 3, Valley Gem Farms on Gana of Valley Gem and Nancy Lee of Valley Gem; A. R. cow to be shown with two of her progeny, Valley Gem Farms on Gana of Valley Gem. Get of sire—1, Gile; 2, Springbrook Farm; 3, Valley Gem Farms. Produce of cow—1, Vetter; 2, Gile; 3, Valley Gem Farms. Exhibitor's herd—1, Gile; 2, Valley Gem Farms. Young herd—1, Gile. Calf herd—1, Gile; 2, Valley Gem Farms; 3, Springbrook Farm.

Senior and grand champion bull—Weiser's King Tom. Junior champion bull—Chicona Joseph Pride.

Senior and grand champion female—Jewel of Rose City. Junior champion female—Lavender of Chicona.

Ayrshires

As in the case of the Guernseys the Ayrshire show was short in numbers but improved in uniformity. Likewise, also, the tops have been excelled at the Pacific International. It was encouraging to view the improvement evidenced in the young classes which were the best in the competition except the aged cow class and the two-year-old bulls. The outstanding female of the show was the junior yearling heifer, Wenatchee Stewart Lady, and her designation for the purple banner was early a foregone conclusion. She is a mighty sweet heifer with an abundance of quality and a real Ayrshire conformation. A Wisconsin entry from the famous herd of Adam Seitz was the best of three good two-year-old bulls and was made grand champion. Another Seitz entry, Lucindy of Spring Castle 4th, topped the group of aged cows which included three other typy individuals of considerable strength. A four-year-old, Empress Lady of Wenatchee, was senior champion female and came from the herd of E. W. Van Tassell, Washington, as did the junior champion bull, Wenatchee Scottish Cavalier. The Van Tassell herd, always a leading factor in the show, staged pretty competition with the herd of W. J. Domes, Oregon, which also is always on hand at the Pacific International. While both herds are showing improvement from year to year, the Van Tassell entries had somewhat the edge and took the majority of the blue and red ribbons.

STEWART GIRL OF WENATCHEE 3RD, JUNIOR AND GRAND CHAMPION AYRSHIRE FEMALE
OWNED BY E. W. VAN TASSELL, WASHINGTON

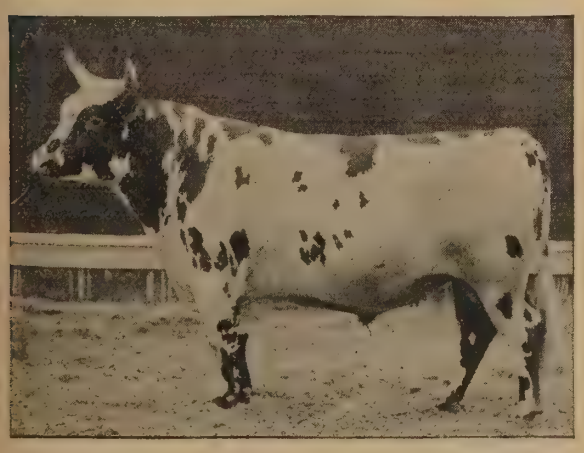
Judge—A. C. Oosterhuis, Wisconsin

Exhibitors: E. W. Van Tassell, Washington; Earlcrest Stock Farm, A. F. Domes, W. J. Domes, Oregon; Adam Seitz, Wisconsin.

The awards were as follows:

Bull 4 years old or over—1, Van Tassell on Cavalier's Scottish Emperor. Bull 2 years old and under 3—1, Seitz on Cavalier Sherry Redman; 2 and 3, Domes on Shortie of C. H. A. F. and Panagin on C. H. A. F. Senior yearling bull—1 and 2, Domes on Sheridan Boy and Bussie of C. H. A. F. Junior yearling bull—1, Domes on Junior of C. H. A F. Senior bull calf—1, Van Tassell on Wenatchee Scottish Cavalier; 2 and 3, Domes on Dolly Boy of C. H. A. F. and Jolly Boy of C. H. A. F. Junior bull calf—1 and 3, Van Tassell on Wenatchee Scottish Cavalier and Wenatchee Royal; 2, Domes on Our Laddi of C.

Cow 5 years or over—1, Seitz on Lucindy of Spring Castle; 2, Domes on Fondula Girl of C. H. A. F.; 3, Van Tassell. Cow 4 years old—1 and 3, Van Tassell on Empress Lady of Wenatchee and Lady Bruce of Wenatchee; 2, on Princess Snowdrop. Cow 3 years old and under 4—1, Van Tassell on Wenatchee Blossom; 2, Domes on Little Miss Sentinel of C. H. A. F. Cow 2 years old and under 3—1, Van Tassell on Ellen Scott of Wenatchee; 2 and 3, Domes on Beauty of C. H. A. F. and Daisy Bells of C. H. A. F. Senior yearling heifer—1 and 3, Van Tassell on Stewart Girl of Wenatchee 3rd and Blue Bell of Wenatchee; 2, on Dulla Again of C. H. A. F. Junior yearling heifer—1 and 2, Van Tassell on Wenatchee Scott and Wenatchee Stewart Lady; 3, Domes on Miss Peter Pan II of C. H. A. F. Senior heifer calf—1, 2, and 3—Van Tassell on Stewart Girl of Wenatchee, Wenatchee Scottish Belle, and Wenatchee Iota. Junior heifer calf—1 and 3, Domes on Club Girl of C. H. A. F. and on Miss Peter Pan; 2, Van Tassell on Wenatchee Lady Fair.



Cow having official record begun at 5 years or over—1, Van Tassell on Lady Bruce 2d. Cow having official record begun under 5 years—1, Seitz on Lucindy of Spring Castle 4th; 2 and 3, Van Tassell on Empress Lady of Wenatchee and Ellen Scott of Wenatchee. Get of sire—1 and 2, Van Tassell; 3, Domes. Produce of cow—1 and 2, Van Tassel; 3, Domes. Exhibitor's herd—1, Van Tassell; 2 and 3, Domes. Young herd—1 and 2, Van Tassell; 3, Domes. Calf herd—1, Van Tassell; 2, Domes. Dairy herd—1, Van Tassell; 2, Domes.

Senior and grand champion bull—Cavalier Sherry Redman. Junior champion bull—Wenatchee Scottish Cavalier.

Senior champion female—Empress Lady of Wenatchee. Junior and grand champion female—Stewart Girl of Wenatchee 3rd.

Brown Swiss

The Brown Swiss competition was keen. All the entries were from Oregon herds. Two or three good herds that have become established in the mind of the ringside as fixtures at the show were not on hand this year. Many of the entries were not what the breed should be in udder development. Progress was noted in the general make-up of the classes. T. Brugger & Son lacked but one of making a clean sweep of the championships. Their good bull, Jessie's Lot, for several years a winner, was senior and grand champion, and an April calf, Gresham

CAVALIER SHERRY REDMAN, SENIOR AND GRAND CHAMPION AYRSHIRE BULL
OWNED BY ADAM SEITZ, WISCONSIN

(Continued on page 613)

"Here, where land is good and cheap farming is a paying business"

says F. A. SPEARS, *and he proves it*

F. A. SPEARS
(From an actual photograph)

There is nothing startling about the story of F. A. Spears. Many farmers have done better in Montana.

Spears isn't rich, but he has a fine farm and plenty to live comfortably on. And all he has he has made in Montana.

We have chosen his story to tell because he is typical, because we know that what he has done is what any industrious farmer can do in Montana.

Ten years ago, Spears worked in a store. Besides that, he had nineteen acres of irrigated land next to town, just a home and garden, with a cow and a few chickens.

But Spears had been brought up on a farm back in Iowa, and he began to hanker for a real place to dig.

So he rented out the nineteen acres, took his family and goods—a few household things, a saddle horse, five head of cattle, and about a hundred chickens—and went out to homestead half a section.

About two years after that the nineteen acres sold for $4500, but Spears had to wait for his money.

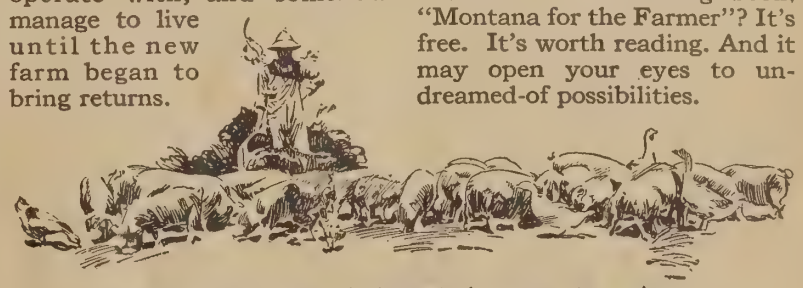
And in the meantine he had to break his land, put up buildings and fences, sink his well, buy farm equipment and livestock to operate with, and somehow manage to live until the new farm began to bring returns.

Today, after ten years, besides the original half section, Spears has paid more than half on a full section adjoining.

He has a good home, with a good barn, silo and ice house. His stock, poultry, garden and little orchard give him more than a living by themselves, and he makes a substantial profit every year on his field crops.

He is happy. He is free from debt, except for what he still owes on the additional section he bought. And he believes in Montana.

And there are thousands of Montana farmers about whom we could tell much the same story. Like Spears, they have been able to make good on a small start.



Homesteading days in Montana are over. But land there is cheap, cheaper than it will ever be again.

And the Montana acre is proved to have a larger earning power than that in many states where land costs from two and a half to five times as much.

Montana is a good place to live. Its climate is healthful; its mortality is the lowest in the United States. Its school system has been pronounced the finest in the country. Its vast resources assure it a great industrial future.

Farmers everywhere owe it to themselves and to their children to learn about the opportunities Montana offers as a place to farm and a place to live and grow up.

Why not send the coupon below for our interesting book, "Montana for the Farmer"? It's free. It's worth reading. And it may open your eyes to undreamed-of possibilities.

Feed for MORE MILK and Bigger Profits

Fully 90% of all dairy rations are lacking in bulk and succulence, say authorities. Bulky feeds, mixed with concentrates, aid digestion. They also keep the bowels open.

Make DRIED BEET PULP

A part of your dairy ration

This succulent vegetable feed gives bulk in a remarkably palatable and healthful form. It is laxative, easily digested and rich in carbohydrates. It is a wonderful milk producer, promotes health and increases profits. You can use Dried Beet Pulp with corn silage or to replace it.

Ask Your Feed Dealer

THE LARROWE MILLING CO., Detroit, Mich.

EDITORIAL COMMENT

TO THE DAIRY COW

If it were not for you, "dairy cow", a government by the people, of the people, and for the people could not be so successfully developed nor would it last; people of nations could not be properly fed; little children would be stunted, undernourished, less mentally alert, liabilities to a nation; farm homes could not be so successfully developed; the soil would be more rapidly depleted; less happiness would reign in the homes of many; the heart of man would cry out for the products of your efforts. Surely you have contributed much to the happiness and prosperity of mankind. For this we render thanksgiving and implore your keepers to give you a square deal.

HIGH AND LOW COWS

The last annual report of the Farmington Cow Testing Association, Wisconsin, shows that the ten high cows produced 5,033 lbs. of fat for the year. The ten low cows produced 1,246 lbs. fat for the same period. Any two of the high cows produced 1,006 lbs. fat.

The value of the fat above feed costs for the ten high cows was $1,816.77. Only $213.68 above feed cost is credited to the ten low cows. It took 8½ of the ten poor cows to produce as much net profit as was produced by one of the high cows.

Production per cow is a significant thing when backed by such a striking illustration. One man with 10 cows like the first group could produce as much net profit as another man with 86 cows like the second group.

TOO MANY STARTERS

"There are too many men starting things," said a very dependable authority in the dairy industry recently when discussing production and marketing of dairy products.

This same thought is brought out by the authors of a recently published bulletin by the Minnesota Experiment Station in a study of co-operative marketing. It was the conclusion of the authors of this bulletin, after careful study and analysis of all of the information available on the history of co-operative marketing in this country, that altogether too often the promoters of co-operative marketing schemes and plans appear to be more interested in "starting things" than they do in knowing how to successfully execute the follow up. Get the growers' names on the contract first, the successful marketing of the products is a minor factor and can easily be taken care of later—sign here—is the attitude of many and has been the forerunner of many failures.

It is mighty easy for these professional starters to get a lot of irons in the fire and fan them into a white heat with temporary enthusiasm but it is quite another task to know what to do with them before they burn up or grow cold for want of knowledge on what to do and how to do it.

WHEAT PRICES STILL ADVANCING

When wheat made its rapid advancement in price this fall, a story to the effect that it was done for political reasons was given wide circulation and believed by some people. Since election day, November 4th, wheat has advanced in the neighborhood of 15 or more cents per bushel and other crops, such as rye, barley, and corn, have also advanced in price. We have not seen any comments as to what might be the cause of the rapid advancement in the prices of these farm products. As near as we have been able to determine, prices of cereals have advanced rapidly because there is a world's shortage of these products. Several wheat countries have short crops and the world has come to our country for some of its breadstuff. The corn crop is estimated by the government to be about five hundred million bushels less this year than last and of poorer quality. It seems reasonable to us that the prices of farm products have advanced because there is a world's shortage of these crops and that political parties have had nothing to do with the advancement of the prices of these several farm commodities.

We think it well for people to consider the factors that affect prices of farm products rather than to be mislead into thinking there is some artificial way of stimulating prices. We can not hope to make progress in solving the agricultural problems with false and erroneous statements. What is needed is accurate information.

FUTURE LIVE STOCK MEN

The condition of any business is a reflection of the characters and personalities of those engaged in it. It is true of farming and particularly is it true of the business of breeding live stock. The heights attained today in the development of our herds and flocks were reached not by chance but because men desired improvement and had the initiative and the energy to bring it about.

Why do some communities lag behind in the quality of their live stock? Sometimes, it is true, because of unfavorable conditions of soil and climate but more often because there are not real stockmen among the inhabitants. Economic necessity has its influence, of course, but the individual reacts to it according to the characters of which he is made and the equipment with which he is endowed. It is said that "real stockmen are born, not made" and there is much truth in the saying. It is true also that the born stockman can be made a better one by training him for the job.

The live stock in this country 25 and 50 years hence will be what the coming generation of stockmen make it. Young men are growing up and taking over old established herds or preparing to start new ones. They must know more and they must be fired with the ambition to attempt more or we shall not be able even to retain the development we now have.

They need training and it should begin early. The boys' and girls' club work is a field in which interest is aroused and the metal of the youngsters tried out. Many high schools could well give some attention to organizing the courses so that more live stock work could be taught in a practical manner. Many of the colleges of agriculture are offering short courses which are a combination of definite instruction with inspiration to do worthily some worthwhile work that has proved to be especially well suited to equip young stockmen for their life work. Many take advantage of these courses, but many more should. It means much to them individually and it means much to the communities of which they may be members.

PUTTING OVER SOMETHING BIG

Agriculture is handicapped because we have so many people who desire to put over something big in its behalf. There seems to be little consideration given to those who believe that advancement in any enterprise is a drilling process. As we look over the development of large business enterprises, we find it has come through hard work, close application to business, and not by attempting to put over something big. The dairy farmer should, now and then, sit on a sack of feed in the winter and ask himself these questions: What is it I can do to increase my income? Am I keeping the right kind of cows in my barn? Are they capable of returning me a profit? Am I feeding my cows right and am I otherwise giving them the attention necessary to make them good producers? What can I do in other ways that will increase my returns? Is it possible, through co-operation with my neighbor, to manufacture my products and put them on the market cheaper than private agencies? If so, how?

When a person begins to ask questions as to what he can do to his herd, his land, his crops, manufacturing his products and marketing them that will lead to better returns, he begins to see, immediately, that agriculture does not offer opportunity of putting over something big in a short time. Its progress must be made by close study of one's business, close application to work, and by intelligent direction of that work. What a wonderful thing it would have been if someone could have thought four years ago, or since, of something outstanding that could be instituted which would bring immediate relief to agriculture! Of all the thinking that has been done by earnest, sincere, intelligent men, nothing has yet been found to bring immediate relief. This does not mean we should give up and say nothing can be done, for anyone who has given a moment's consideration to agriculture can immediately see opportunities everywhere for improvement. An intelligent analysis of agriculture as a vocation will soon reveal that nothing can be put over on a big scale to bring immediate results to this industry. Advancement will come through careful planning and intelligent work.

TO IMPROVE AGRICULTURE

The past few years have brought many plans and suggestions for helping agriculture. Some of them are sound, some of doubtful value, and others worse than worthless. Every fair and honest thinking man, whether he be interested directly or indirectly in agriculture, has felt the necessity of bringing agriculture back to its proper relationship with other industries. This is no small task, for agriculture is so large and its interest so varied and complex that no one thing is wholly responsible for its condition and no one thing will restore it to its proper relationship to other industries. It should be encouraging to everyone to note that prices of many of the agricultural products have advanced sufficiently to make them on a parity with other commodities.

In a recent address B. H. Hibbard, Department of Agricultural Economics, University of Wisconsin, made the following suggestions:

"The government can influence farm prices to no small extent by furnishing information concerning foreign markets; by taking part in the rehabilitation of European people and governments; by furnishing information as the basis of readjustment of American agriculture to fit present conditions; by fostering farmer organizations to the extent of giving them the sympathy and help, the latter mainly along educational lines; by policing and regulating the operations of marketing; by making credit facilities available. Last, and perhaps most important of all, by using its influences in taking out of the agricultural category great areas of marginal land and putting it to some other use, and by furnishing a more intelligent basis by which land may be valued. With these conditions the farmers will have an opportunity of working out their own salvation."

We have commented many times on the undesirability of bringing more land under cultivation and we particularly regret that there are many marginal farms, that is, poor farms, now under cultivation. Both federal and state governments are responsible for this situation and when such periods of depression come to agriculture as we have experienced in the last three years, many of the unproductive farms must be abandoned. This incurs an unnecessary loss of both time and money and from people who can ill afford such setbacks.

The New-born Calf

What care should be given new born calves in order to safeguard them against contracting digestive troubles soon after birth?

Missouri. N. H. R.

Have the calf dropped in a clean, recently disinfected stall, which should be again cleaned and rebedded as soon as the calf is on its feet. Thoroughly clean the navel and disinfect with iodine as

soon as the calf is born. See that the calf sucks each of the four teats a little at its first meal and leave it on the cow about three days. A quart of milk allowed three times per day is sufficient for the first three or four days. After this the amount should be increased gradually up to two quarts for each feeding. The calf's stomach is small and requires small amounts fed often. More trouble results from overfeeding than underfeeding. Whole milk should be fed for nearly a month, diluted a little at first if from a high testing cow and gradually changed over to skimmilk. Water should be given as soon as the calf will take it and grain (whole oats and corn) and hay should be supplied as soon as the calf will take notice of it. Overfeeding of alfalfa may tend to cause digestive trouble at the beginning.

Tramping Silage

HOARD'S DAIRYMAN:—In a recent issue of Hoard's Dairyman you ask for experiences on the value of tramping silage. When we began to fill our three silos with our own outfit we were short of help and tried to dispense with anyone in the silo. We went in every morning and leveled off the cut corn, tramping it somewhat, then left it to be settled by the succeeding day's cutting. Two objections to this system soon developed: First, it is not possible to get in anywhere near the amount of corn the silo should hold; and, second, if the corn becomes the least bit dry or frosted before ensiling it is practically certain to develop mold, especially at the outer edge. We now use all the help we can spare in the silo at filling time and believe it pays to do so.

New York. FRED H. TUTTLE.

Shavings and Acidity

I find it necessary to use a considerable quantity of pine shavings and sawdust for bedding. Will this resinous material have a tendency to increase acidity of the soil? Would the product of white pine be much better? Would the use of gypsum in the gutters and manure absolutely keep the soil sweet and fit for alfalfa?

Perryville, Md. H. N.

We have no information indicating that shavings or sawdust used as bedding will increase the acidity of the soil any more than the use of straw. The largest factor in creating soil acidity is the removal of lime in the growing crop and the leaching of the soil itself. There is some acidity developed through the fermentation or rotting of the organic matter such as manure and stubble that is plowed up. This, however, is a factor that cannot be avoided where good crops are expected. Indeed, this fermentation is essential to good crops.

The major objections that we have had as to the use of shavings for bedding are that they do not decompose readily in the soil and some men are prejudiced against their use. The statement has been made that the shavings and sawdust have little actual fertilizing value. It would be our opinion that the white pine shavings would decay less readily than would the hardwood shavings.

It is doubtful whether enough gypsum could be used in the gutters to replace the lime that is taken from the soil by the growing plants. It would, of course, help according to the amount used. We anticipate, however, that where soils show acidity, the best control is to apply lime in requisite amounts as shown by tests.

Pole Beans With Corn

HOARD'S DAIRYMAN:—Getting the most protein out of home grown feeds is a problem worthy of more serious thought and study at the present time than ever before. In these days of high grain prices and comparatively low milk values, it behooves the dairyman to conserve every pound of protein possible, for protein is the highest priced nutrient of purchased mill feeds.

Growing soy beans with the corn for silage is a practice that has become quite common among dairymen, for this purpose, and is a step in the right direction. The practice has several disadvantages, however. The seed is so small in comparison with the corn that uniform planting is somewhat difficult. The bean plants have a tendency to fall away from the corn stalks and are not all gathered by the binder. The comparatively short bean plant does not fasten well into the bundle of corn and considerable waste results in handling the bundles.

In seeking to find a suitable legume to grow with silage corn, that would overcome these difficulties, the Rhode Island Experiment Station tried pole beans in the corn with excellent results. County agents were quick to pass the idea on to farmers and several demonstrations were conducted. The demonstrations in each case proved so successful that many farmers took it up, and it is now becoming a common practice.

Two varieties were found to be best adapted, the Horticultural Pole Bean and the Kentucky Wonder. Both beans produce a heavy growth of climbing, twining vine and yield heavily of good sized beans. The vines climb the cornstalks and are thus easily cut by the binder and held firmly in the bundle.

Two general methods of planting were used. The first was to mix one part beans and two parts corn in the hopper of the corn planter and plant in drills, using about one-half bushel of beans and twelve quarts of corn to the acre.

The second method was to check row the corn three feet each way and when about three to four inches high to go over the field with a hand planter of the stab type, jabbing in three to four beans to every hill of corn.

Both methods have worked very successfully, the second method having somewhat the advantage in that the corn will get a start and furnish a good pole for the beans to climb on. Being planted later the beans do not become as mature and there is less dying down of the vines, thus giving a greater yield of green forage to the acre.

The Horticultural Pole bean is a shell bean and has a good demand in the market for this purpose. The Kentucky Wonder is an excellent and prolific green podded string bean, having pods from six to eight inches long. Many farmers have found it profitable to pick the beans and market them as a cash crop, leaving the vines to go into the silage as a source of protein. Whether this practice is the most profitable or whether the beans should be left on the vines is questionable as the beans are rich in protein. The answer would probably depend upon the market price of the beans. At any rate the silage is of considerable more value for having the bean vines with the corn, for the vines not only add materially to the total tonnage but also contain considerable protein.

One of the doubts often expressed by farmers before trying this practice is that the beans may cross from one row to the other and hinder cultivation and harvesting. Little trouble will be had from this source for the vines begin to twine early in their growth and will seize on to the object nearest them, consequently little crisscrossing is experienced. This is especially true where the beans are planted by the second method. The yield of vine per acre from either of these varieties is about double that of soy beans.

Rhode Island. SUMNER D. HOLLIS.

(EDITORIAL COMMENT:—In reply to our inquiry Mr. Hollis informs us that the growth of beans does not seem to interfere with the growth of corn and the shade of the corn does not seem to injure the growth of beans. Test plots at the state experiment station showed a yield of 20 tons per acre, of which 4 tons were beans. This percentage of beans is greater than we would have expected. What has been the experience of those who have tried out this combination? Does it increase the total tonnage from an acre of silage?)

Scours or Diarrhea in Calves

"The most common ailment of calves and the one giving the most trouble in calf raising is diarrhea or scours," say Frandsen and Nevens, of Nebraska. "It occurs most frequently in young calves, though older calves are also subject to it. There are a number of causes of this trouble, the most frequent of which are overfeeding, temperature of the milk, and amount fed; character of the feed —that is, a change from sweet milk to sour, or the feeding of moldy or damaged feeds; exposure of calves to cold or dampness; unclean pails or feed troughs from which calves are fed. The last is a frequent and often unsuspected cause. Steps should be taken to stop the trouble on first indications, because the calves will become weakened and may finally succumb through lack of vitality. Older calves may develop chronic scours, which prevents them from growing rapidly.

"The first step is to determine the cause and remove it. The milk allowance should be cut down one-half, and in severe cases omitted entirely for one or two feeds. Usually a physic, such as one of flour and lime water, should be given. Lime water assists in removing any irritating materials from the digestive tract. The first action of castor oil is that of a physic, and later it acts as an astringent. Common remedies are scalded milk, flour and lime water. The latter, which should be clear water after the slaked lime has settled, may be mixed with the milk in equal parts. In case more drastic measures are necessary, two teaspoonfuls of one part salol and two parts subnitrate of bismuth may be given in a small quantity of milk every six hours; or one teaspoonful of laudanum may be given every twenty-four hours. The latter is somewhat dangerous for young animals and should not be used except as a final resort."

Alfalfa For Pasture and Hay

HOARD'S DAIRYMAN:—For the past four years H. E. Hazen of Southeastern Iowa has pastured a ten-acre field of alfalfa with hogs, horses, and cattle. Besides furnishing a pasture which can not be beat it helps him with his hay crop. The first cutting usually comes at a very busy and rainy time. He has delayed cutting for several weeks by pasturing and says he gets a much finer hay as a result.

In the spring he turned his stock on the alfalfa on April 22. Forty-six head of hogs, brood sows and shoats, 10 head of horses, and 23 head of cattle had the run of the ten acres. The cattle were yearlings and a few cows which also had calves at side. These he did not include in the 23 head mentioned since they were too small to eat much alfalfa. The horses were colts and a few older. Over Sunday the 12 head of work horses were added to this number.

If the spring is very wet, so that the stock will injure the alfalfa by tramping, he does not turn in. However, for the past four years he has had no damage from tramping. The stock stay on pasture until the latter part of May and then they are put on bluegrass. In a field this size the stock kept the alfalfa from making a coarse, woody growth and after they were taken out the alfalfa grew rapidly, and produced a fine stemmed hay. A year ago his first crop averaged 1¼ tons after pasturing, the second cutting was ¾ ton, and the third cutting ⅛ ton of hay. This light yield he attributes to the dry season since his average for ten years has been over three tons per acre.

That fall the alfalfa made about a ten-inch growth. Late in November he turned in his flock of sheep and left them there until February. They ate the alfalfa close to the ground and even into the ground. In spite of the severe winter, and the fact that he had common alfalfa, his stand did not winterkill. His farm is in the southeastern corner of Iowa and the winters are not severe, as a rule. He has tried pasturing his fall growth with sheep for the past four years and, in spite of general opinion, has not lost or injured his alfalfa.

Pasturing will encourage blue grass to come in, says Mr. Hazen. So far he has not been troubled enough to require cultivating. At first his hogs started to root up the patch but he rung all of them and stopped this trouble.

There are few farmers growing alfalfa in his neighborhod. A number tried it but did not lime and the result was no stand. Mr. Hazen has only failed to get a good stand once. About ten years ago he tried growing it without applying lime. It did not work. Since then he has always limed although he has to have the lime shipped in.

He believes alfalfa is a better paying crop than corn, acre for acre. It can not be beat for pasture and hay for any class of live stock. It does take work to get a field started and to harvest the crops but it pays and pays well in his estimation.

He is an advocate of sowing in the spring with a nurse crop. Heretofore he has always used rye and wheat for nurse crops. This year he sowed 26 acres with Grimm alfalfa and used both early oats and wheat for the nurse crops.

His cattle have never given him any trouble to speak of by bloating while on alfalfa pasture. Even when the alfalfa was wet they did not bloat. He always fed silage to them but they did not eat much. A few calves bloated slightly at one time but not enough to require any attention.

In the spring Mr. Hazen topdressed his alfalfa field with manure. He believes this is a good practice to follow. Since he has a large number of cattle on the farm all the time he aims to put back as much of the crop on the fields as possible in the form of manure.

Iowa. A. M. WETTACH.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00 including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Coming Events

Dec. 10-12—Wisconsin Cheesemakers' Association meets in Milwaukee Auditorium. J. L. Sammis, Secretary.

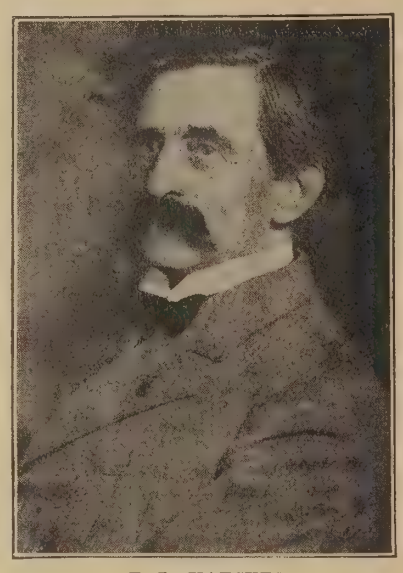
Dec. 10-16—Pacific Slope Dairy Show, Oakland, Calif.

Carlson Holstein Sale

The dispersion of the Enoch Carlson Holstein herd, Oct. 31, at Roberts, Wis., attracted buyers from four states who took the 35 head for $4,620 with $300 for the top cow purchased by the St. Croix, (Wis.) County Asylum. Reppert and Hansen did the selling with Everson in the box.

A visitor said to a little girl, "And what will you do, my dear, when you are as big as your mother?"

"Diet," said the modern child.—Tit-Bits.



Tom Tarheel says the reason he is checking up the results of his farm work this year is because he doesn't like to travel in the dark.

Buttermakers Honor T. L. Haecker

The National Creamery Buttermakers' Association of recent years has adopted the practice of giving formal recognition of distinguished service in the dairy industry to some outstanding individual who has withdrawn from active work.

At the annual convention of the association this year held at Mason City, Ia., Nov. 11, 12, 13, it was the pleasure of President H. C. Larson to present a gold medal suitably engraved to T. L. Haecker, of Minnesota, in recognition of distinguished service.

It is interesting to note that back beginning in 1874, when Mr. Haecker was operating a Jersey and Guernsey farm in Dane County, Wisconsin, he

T. L. HAECKER

became associated with W. D. Hoard while the latter was governor of Wisconsin, serving as executive clerk.

In presenting the medal, Mr. Larson gave a brief review of the contribution that Mr. Haecker has made to the dairy industry. "He is known today as the father of dairying in Minnesota," said Mr. Larson.

In closing, Mr. Larson quoted the following verse which seemed to him to perfectly express this great man's determination from the beginning and all through his life:

"To keep my health, to do my work, to live,
To see to it that I grow and gain and give;
To wait in weakness and walk in power,
But always forcing onward to the light,
Always, always facing toward the right.
Robbed, starved, defeated, fallen wide astray,
On with what strength I have—on in the way."

National Buttermakers Meet

In opening the annual convention of the National Creamery Buttermakers' Association held November 11, 12, 13 at Mason City, Iowa, President H. C. Larson placed before the members in attendance some of the more important problems that should have their attention. In addition to this he also spoke of some of the good things the association had accomplished.

The problems for consideration were as follows: 1, should the association continue membership in the American Dairy Federation; 2, should the association consent to the changes in standards for ice cream as asked for by the National Association of Ice Cream Manufacturers; 3, should the association board of directors be empowered to cast a referendum vote when necessary and more particularly when asked by the American Dairy Federation; 4, should the association change the time of annual convention from fall to spring season; 5, should the preparation of the history of the association be authorized; 6, should we make such changes in finance as will enable the association to employ a full time secretary; 7, we should discuss ways and means of improving the conditions for the individual members of our association as well as those of the farmers.

Mr. Larson called attention to the support that the association gave towards the establishing of the U. S. Dairy Bureau. He spoke of the co-operation given to the National Dairy Exposition in the way of contests and exhibits of products and laid special emphasis on the cream grading contest conducted this year. The cold storage butter contests have done much to lead the way for better quality and production methods.

North Carolina Jersey Record

J. F. Diggs of North Carolina is the owner of Pioneer's Country Lassie, a 7-year-old Jersey cow that has completed a splendid 365-day test. In one year Lassie yielded 747.52 lbs. fat and 11,986 lbs. milk, and for ten months of this time she produced well in excess of 50 lbs. of fat per month.—American Jersey Cattle Club.

An Ideal Dairy Farm

To be Sold At Public Auction, Dec. 18

This sale is being made because other interests require the owner's continual absence from home, and it affords an opportunity to secure a highly productive and a well equipped stock or dairy farm in the very heart of a section that offers as many advantages to a real farmer as any section in this country. The farm contains 320 acres and is located a mile and a half southeast of HURON, S. D., a prosperous and rapidly growing city of 12,000 population.

The farm is in a high state of cultivation, having been maintained for years as a stock farm, and it produces annually large crops of corn, oats, and barley. Fifty acres are on the Jim River bottom and are in alfalfa which produces yearly three and four crops. Corn on this farm made 70 bus. per acre in 1922, and 75 bus. in 1923. Oats yielded 75 bus. and 55 bus. per acre the same years, and in 1924 oats made 50 bus. and barley 45. The soil is medium loam, underlaid with clay, and is easily worked.

BUILDINGS: The buildings are nearly new and include a six-room house with full cement basement and large screened in porch; one barn 64 by 96, with 11 box stalls and stanchions for 30 cows, single stalls for 6 horses, grain bins and large storage room for hay; one barn, 40 by 50, arranged for cattle and sheep; corn crib and granary combined with cement driveway; hog house, 16 by 30; hen house, 12 by 30, and a machinery, tool house and garage combined, 24 by 55. A large grove, mostly ash, north and west of the buildings adds beauty to the surroundings. The fields and numerous yards are fenced with hog tight fencing, and soft water from an artesian well is piped to buildings and yards and then empties into a large cement tank which has never frozen over.

Huron offers a ready and stable market for all form of dairy products. A new packing plant has been completed two miles from farm, and Swift & Company are erecting a large plant for handling poultry and dairy products. The Huron public school system is one of the best in the Northwest, and Huron College has a high standard, its graduates being admitted to the large universities. This sale presents an opportunity to acquire an ideal home and a profitable business for less than one-half the investment that would be required for a similar acreage in the older settled sections of the country. For further information and terms address.

D. E. McMONIES, Owner **HURON, S. D.**

Let Us Send a Simplex FREE For You To Try

Just mail the coupon below. We send one bowl prepaid for you to use. Return it if you care to—or order for your barn.

Operates on any pressure up to 100 lbs. Valve cannot stick and flood. Shallow bowl permits normal drinking position.

SIMPLEX
The World's Best Water Bowl

This is not an argument for stock watering. Every dairyman admits its value. But he also knows its practical success depends altogether on the operation of the bowl itself.

Perhaps you have experimented with the old unsatisfactory "float system." Perhaps you are now using an automatic bowl that is not all that you think it should be. Or perhaps you have a bowl that you think is pretty good. In any case, this offer is made directly and individually to *you*.

We might use this space to *tell you all about the Simplex.* But we prefer to say, "We believe the Simplex is the one perfect water bowl. Try it FREE and see what you think about it."

Showing how the hinged Simplex drops for cleaning. No working parts under water.

If this sample doesn't sell itself to you without any argument or sales talk, then send it back. You're not out one cent. No strings to this offer. No deposits. No C. O. D. Nothing but the straight-forward offer. Try it free. Then buy for your barn—or pay for the sample only—or send it back—just as you please.

The Simplex is not new—not an experiment. Tens of thousands have been sold. Many of the biggest dairy cattle breeders in the country use them. Men like E. C. Schroeder, of Moorehead, Minnesota, say, "The Simplex is the best bowl we have ever seen." But we don't ask you to take the word of others, however authoritative it may be. Once you have this sample in use, where you can watch it, you need no recommendations from anyone to sell you. The Simplex sells itself.

Whatever your attitude for or against other water systems, we urge you to accept this offer. Get this sample. Watch the bowl to your entire satisfaction. Then do as you please about buying. No fairer offer could be made. Mail coupon.

F. Rassman Manufacturing Co.
Dept. 28-58, Beaver Dam, Wis.

You may send me a sample Simplex Automatic Water Bowl, free and prepaid. It is understood that I will try this bowl for 30 days without any obligation to buy. After trial, I will either return the bowl to you or remit its price of $3.50—or order for my barn.

Trenton Guernsey Sale Breaks All Records

47 Head Average $2,856

A new and exceptional price record for a public sale of Guernseys was established at Trenton, N. J., on November 14th. Forty-seven registered Guernseys consigned by W. W. Marsh of Iowa, D. D. Tenney of Minnesota, F. J. Reuping of Wisconsin, and Myron A. Wick of Ohio were sold for $134,245, an average of $2,856, just $118 higher than the previous high mark established years ago by the dispersion of the herd owned by the late F. Lathrop Ames. Another record that went up Nov. 14 was the high price for a Guernsey cow. Shuttlewick Levity, a show heifer and a class leader, daughter of Langwater Levity, consigned by Mr. Wick, was purchased by J. O. Winston of New York for his Saugerties Farm herd at $22,000.

It is interesting to note that in Mr. Wick's consignment were seven animals of one family that brought exceptional prices. Langwater Levity purchased of F. Lathrop Ames for $6,000, now a 10-year-old cow, brought $15,000. Her daughter, Shuttlewick Levity, mentioned above, sold for $22,000. Three other daughters increased the total by $24,100, one granddaughter added $11,100 more, and a second another $1,700, making a grand total of $73,900 for the seven members of the family, an exceptional figure, indeed.

The highest priced bull of the sale, Cherub of the Prairie, was a Marsh consignment. He was first as a calf at the 1923 National and after spirited bidding was struck off for $10,000 to H. L. Tinkham of Massachusetts.

Altogether 22 animals sold for $1,000 each or more and but 12 for less than $500 each. Most of the entries were purchased by eastern breeders and quite probably many of them will be seen at the 1925 shows.

Charles L. Hill, Wisconsin, managed the sale.

The following list includes those animals selling for $1,000 or more and names of buyers:

John E. McLoughlin, New York	
Itchen King	$2,100
Oscar Whittemore, Massachusetts	
Saugerties Ultra Monarch	$1,350
Mixter Farm, Massachusetts	
Cherub's Contender of Shorewood	$2,500
H. F. Andrus, New York	
Langwater Levity	$15,000
Shuttlewick Mirth	11,100
Shuttlewick Rosebud	1,700
Day Dream of the Prairie	2,300
Corium Elizabeth Dolores	1,075
J. O. Winston, New York	
Shuttlewick Levity	$22,000
John Ames, Massachusetts	
Shuttlewick Queen of Joy	$8,100
Wm. H. Williams, New York	
Shuttlewick Happy Girl	$6,000
Diamond of Maple Hill	4,600
Emmadine Farm, New York	
Shuttlewick Laughter	$15,000
Honey Bloom of the Prairie	5,600
Peach Bloom of the Prairie	5,000
Coumsett Farm, New York	
Honeydew of the Prairie	$4,000
Marsh Marigold of the Prairie	4,000
Sweet May Rose of the Prairie	1,000
F. J. Reuping, Wisconsin	
Lilac of the Prairie	$1,000
H. L. Tinkham, Massachusetts	
Cherub of the Prairie	$10,000
R. R. Carpenter, Delaware	
Bopeep's Rose Des Houards	$1,000
A. Stanley Bell, Maryland	
Floridale Merry Maid	$1,725

FORWARD WISCONSIN
FARM FACTORY COMMERCE

A Program for Wisconsin Prosperity

Factory—The factory creates for the Wisconsin farmer the finest of all markets—the *Home Market*—right at his door.

Farm—The foundation of our state's well-being. "Every farm is a factory".

Home—Where all prosperity and well-being bear fruit. Wisconsin might well be called The State of Happy Homes.

• • •

"Doctor, Lawyer, Merchant, Chief," all owe their livelihood to *production*, their prosperity and opportunity to Farm and Factory.

BELIEVING that the prosperity of Wisconsin depends upon the combined efforts of the producers of farm and factory—

Believing that the future holds even greater prosperity, provided our producers are not held back with unfair laws, high costs, and higher taxes than are collected in other states—

Believing that the world is the market for the products of Wisconsin factories and for the surplus from the farms; that sales in other states make better markets at home; that factories in Wisconsin bring money into the state, while factories in other states take money out—

Believing that if we are to have the best opportunities in Wisconsin for our citizens on the farms and in the factories, in business, in the professions, and for our children, we must work together for a broad, sane and progressive program—

Believing that our permanent prosperity depends entirely upon straight thinking today, this Association has decided to place before the citizens of the state some vital facts that concern our future.

There will be a series of straightforward messages. Watch for them, study them, and help build a permanent prosperity for Wisconsin.

WISCONSIN MANUFACTURERS' ASSOCIATION
MADISON, WISCONSIN

THE COMMITTEE IN CHARGE OF THIS "FORWARD" PROGRAM IS
CARL A. JOHNSON, President Gisholt Machine Co., Madison
WALTER KOHLER, President Kohler Co., Kohler
GEORGE VITS, President Aluminum Goods Mfg. Co., Manitowoc
W. H. ALFORD, Vice-President Nash Motors Co., Kenosha
OTTO H. FALK, President Allis-Chalmers Mfg. Co., Milwaukee
F. H. CLAUSEN, President Van Brunt Mfg. Co., Horicon
GEORGE F. KULL, Secretary Wisconsin Mfrs. Ass'n., Madison

FARM AND FACTORY MUST PROSPER TOGETHER

"The improved acre must yield not only corn but civilization, not only potatoes but culture, not only wheat but effective manhood."—KENYON L. BUTTERFIELD.

Says Sam: Prejudice is the weed that halts the growth of reason.

LEFT TO RIGHT—W. W. MARSH, CHAS. L. HILL, MYRON A. WICK, D. D. TENNEY AT THE GUERNSEY SALE, TRENTON, N. J., NOV. 14, 1924

Messrs. Marsh, Wick, and Tenney and F. J. Reuping of Wisconsin were the consignors to the sale which was under the management of Mr. Hill.

SHUTTLEWICK LEVITY, SOLD AT AUCTION FOR $22,000 BY MYRON A. WICK, OHIO, TO J. O. WINSTON, NEW YORK

Standing back of cow, P. J. Kelly (with cap) and M. A. Wick, seller of cow.

The Dairy Farm Home

LUCY THOMPSON

Did You Record His Birth

During the war we all learned the value of birth records though most of us who were old enough to take any part were born before the recording of births was thought of widely and seriously.

In 31 of our states and in the District of Columbia the law now requires that the baby's birth be reported promptly by the doctor, nurse, mid-wife, or whatever person attended the delivery. This report is passed on to the local health officer who in turn sends it to the state board of health.

It is possible for you to register your child's birth even in the states where this law is not in force. Just write in to the board of health at your state capitol and they will send you the proper blanks.

It may seem rather needless now but your foresight may save your child much inconvenience and possibly danger later. The Department of Labor at Washington gives these reasons why every birth should be on record:

To prove
1. Age and citizenship.
2. Right to go to school.
3. Legal right to go to work.
4. Right to an inheritance.
5. Right to marry.
6. Right to hold office.
7. Right to secure passports for travel.

Enough Outlets

Be sure, if you are installing an electric lighting system, that you do not economize too much on outlets. To a person used to oil lamps, any sort of automatic lighting seems a godsend even if it is somewhat limited in its use and when it is being put in we are not apt to consider how our demands may expand.

The expense of a few more outlets is small compared with the time and labor they save. You may have a fine vacuum cleaner but if it is hard to make the attachment you will find yourself bending to the old time broom methods more than once.

Strong, direct, overhead lighting is becoming a back number. Where there are several people sitting in a room the natural location of them is a sort of circle, always under the central light. They face all evening toward a glare which is not only hard on the eyes but brings out all the defects of a person or room. The elimination of this glare is one of the best things discovered lately about lighting.

Where a center light is used it should be softened by having an indirect fixture. In a living room there is no need for a center light at all though many prefer them. In the dining room it is different. The living room may be lighted by a couple of wall brackets at either end of the fireplace and if it has one floor plug at the opposite side of the room no more is required as far as lighting is concerned as the floor plug may have a two-way socket attached which will connect both a floor lamp and a table light. A soft light is a thing of beauty of itself and is a great beautifier of plain folks and plain furniture alike.

Every electrically equipped bedroom should have a floor socket placed so that a light may be over the bed. Reading in bed is said to be bad for the eyes but if people will do it anyway they might as well have conditions made as harmless as possible for them.

The kitchen is the only room in the house, to my notion, that justifies a strong overhead light. If the room is not too large this will be sufficient for working in all parts of it.

Extra plugs should be in the room used for laundry for even if you haven't them now you will eventually get an electric washer and maybe ironer, if crops and prices are good. Plugs for these should not be as near the floor as in other rooms as they are less convenient low and may be flooded with water.

In these days of outdoor living don't neglect at least one outlet on the porch in addition to the one in the ceiling used for lighting. It is handy for cleaning and helps a lot when you want to eat your summer meals outside.

Covering the Flowers

In many parts of the country we are having a long and lovely fall; the weather seems to be trying to make up for its treatment during the summer.

If you have flowers such as the sturdy chrysanthemums that are growing in sheltered nooks, you can keep them for weeks yet by watching the weather and covering them carefully when the cold snaps come. In summer we are lavish with the flowers but later on we grow conservative and are glad for just a tiny touch of color to put on the table to cheer up the meals.

When there is no longer any chance of keeping the flowers you can often have the greens, such as honeysuckle vines, clear up to Christmas.

Making the Lunch Hot

If you have the hot lunch system in your school you may have found that the work of getting things ready at noon was most too great for pleasure on the part of either teacher or pupils.

Here is an idea that is not original with me but is so good that I would like to pass it on. Of course there is an oil stove in the school house. Now either get a cheap new boiler or else mend an old one and make either a single rack or a double-decker, according to the number of pupils, to fit the bottom of the boiler.

Let the children take the hot part of their lunch to school in tightly closed pint jars and set them right into the boiler which can be filled at recess with enough water to cover the jars. At 11 o'clock a pupil can light the stove and by 12 everything will be piping hot.

There are any number of things that can be sent to school this way but probably the best are cocoa and soups. There are so many arguments in favor of the hot lunch and it has been shown again and again that children thrive on it better than on the old system. Where there are simply no conveniences, however, it is apt to degenerate into rather a messy affair but with the boiler and rack method each child can look out for his own things as there need be no central cooking dishes.

Uses of Kerosene

Kerosene has many uses around a house aside from burning it in the lamps. At home we used to have a large kitchen clock and when it got a notion that it didn't want to go any longer we used to give its works a good going over—not taking them apart—with a stiff chicken feather dipped in coal oil. We used the same method with the sewing machine. It has a tendency to gum, especially if you are not very particular to use a high grade of oil. Kerosene cuts away this gum.

One of its best uses in any home that has plumbing is for cleaning the enameled ware. It cuts the greasy dirt out of wash bowls and bath tubs like magic. The scouring powders are good but kerosene is easier to use and never scratches the surface.

Apples on a Stick

When days are bad it often happens that children are the same. Have you ever tried making apples on sticks for them? There is so little candy about them that they are not injurious and the children can help in the making of them.

Boil a cup of sugar with a quarter cup of water until it makes a hard ball in cold water. Run stout sticks in at the stems of apples and coat them with the syrup. An adult might not consider this much of a delicacy but it is wonderful to children who always are wanting candy. I wonder why it is that they never beg for spinach, carrots, and the other wholesome things. Just another problem to sharpen the mother's wits, I suppose.

Chocolate Custard

Instead of making plain custard next time, you might like the addition of some chocolate. Custards are appetizing but do not have enough flavor to keep us from getting tired of them if we have them too often. They have such valuable food properties, however, that it is well worth while thinking of ways to vary them and still keep the family eating them.

For the chocolate custard melt one square, add a quart of milk, a pinch of salt, and a half cup of sugar. Scald this and add four beaten eggs. Bake in a moderate oven until a silver knife passed through it comes out clean.

Plain custards can also be varied by serving with a little jelly or fruit on top.

If Bobby isn't helping father, why shouldn't he, as well as Mary, dry those dishes?

Fashion Magazine

Our Fall and Winter Fashion Magazine contains about 300 styles, new hot-iron transfer designs, illustrated dressmaking lessons, a section devoted to styles for children for school, play, and "dress-up" occasions and there are also two pages of pretty Christmas gifts that you can make at home. This book is worth many times its price so we suggest when you send your pattern order that you enclose 10c extra for a copy. Address your order to Fashion Department.

Miscellaneous Fashions

No. 2228—The Button-Down-the-Front Coat Dress. Cut in sizes 16 years, 36, 38, 40, 42, and 44 inches bust measure. Size 36 requires 4 yards of 36-inch material with 3¼ yards of braid.

No. 2189—Smart Model. Cut in sizes 16 years, 36, 38, 40, 42, 44, 46, 48, and 50 inches bust measure. Size 36 requires 3½ yards of 40-inch material with 6 yards of 1-inch braid.

How to Order Patterns

Enclose 10c in stamps or coins (wrap coin carefully) for each pattern ordered. Send your order to Fashion Department, Hoard's Dairyman, Fort Atkinson, Wis. Every pattern is seam-allowing and guaranteed to fit perfectly. Do not fail to state size.

Our patterns are made especially for us by the leading fashion designers of New York City. No stock of patterns is carried in our office and, since all orders are forwarded to the factory, kindly allow a reasonable time for delivery of any pattern you order.

How about making mother's Christmas gift "plum foolish"? Maybe she sees useful things enough in her everyday life.

Opinions, Brickbats, and Bouquets

These columns are open to the readers of Hoard's Dairyman for the expression of their opinion on any subject, whether radical or conservative, destructive or constructive, wise or foolish. It may be cows or crops, religion or politics, or what at the time most interests you. It may be critical or commendatory, but it should be your opinion. It is your own editorial page and the most effective editorial is short and to the point. Hoard's Dairyman assumes no responsibility for opinions expressed.

The New York League and Mr. Lyon

HOARD'S DAIRYMAN:—On page 481 of your October 31st issue of the Dairyman, there appears an article, "New York Dairy Notes," by H. H. Lyon of New York.

The article is interesting to milk producers and readers of Hoard's Dairyman for many reasons. The writer tries to give the impression that the Dairymen's League, or "Poolers", as the present association is commonly called, is a success and at the same time gives the readers of Hoard's Dairyman the impression that this pool has the surplus to take care of from all producers. Mr. Lyon knows better and if he would show more willingness and credit dairymen with good judgment enough to know the difference between $1.70 per hundred and $2.30 or $2.40 per hundred, he would lose his argument. His reference to Sheffield's and a higher price must mean they are getting a better grade of milk and selling more in fluid form than the pool, hence the better price.

After more than five years of the work of the Dairymen's League Co-operative Ass'n and not paying their producers as high a price for milk as many reports that have been received for milk delivered at cheese factories, there is something more than surplus milk the trouble with the pool.

Mr. Lyon says that an announcement that has caused much comment is a recent decision respecting the enforcement of the League contract. He wishes to have the readers of the Hoard's Dairyman know that this decision does not settle the validity of the contract. I take it Mr. Lyon refers to the Holmes' case near his home. Such being the case, I would like to call his attention to the fact that one Mr. Gurnsey signed Holmes' name to the contract, claiming that Holmes authorized him to do so. Gurnsey must be a good fellow. Would he have shown the same willingness to milk the cows and deliver the milk at the station at Holmes' request that he did in signing the contract? I think not. Mr. Lyon might tell the readers of Hoard's Dairyman how many members there were in the Pooling Association on the 18th day of April, 1922, when the non-poolers met in Utica for the purpose of getting more information on the methods of disposing of their milk. Some reports give it that two days later the association tried to vote in all contract signers as members. Mr. Lyon closed with rather a caustic remark about the pooler reading his contract.

Let me ask Mr. Lyon three questions:

Did you ever read the contract? Where is there any consideration for the producer under the common laws of business that makes the contract valid? Article Eleven of the contract states that in the absence of fraud, the producers waive all right to accounting or instituting legal proceedings.

Members of the Dairymen's League and the public were given to understand by the officers of the League that by pooling, they would obtain better prices and it would be their association. Mr. Lyon admits that after the exposure of one fraud by the non-poolers and a wait of nearly three years, the association tried to plug the pool by voting the contract signers as members to something they were led to believe they were before they signed the contract.

The success to better conditions in the dairy business in New York State or elsewhere depends on the dairymen and their families themselves. After nearly fifty years in the harness in dairying and general farm work, I have come to one conclusion at least. And that is that the farmer is not only overloaded with organization but has become top heavy with forced co-operation. By that I simply mean the kind of co-operation put in operation by former officers of the Dairymen's League, Inc., when they undertook to make a monopoly of the milk business and to boss the producers and to relieve themselves of responsibility as shown by their contract. That they used strong methods to get contracts signed can not be denied. I have personal knowledge where henchmen and workers for the pool laid down their contract before a visitor at their meeting and ordered them to sign it. The third time he issued the order, he placed his finger on the line and demanded that he sign there. When the young man was taken to task for his insolence, he turned away to seek other victims. Gurnsey admitted signing the names of others to contracts and did not leave copies with the parties. Now the courts are asked to put their stamp of approval on this kind of co-operation, or forgery as some term it. If there is any section of farming country where this form of co-operation has not got a start, keep it down and out for I believe all the germs of distress are in these two words, Forced Co-operation.

New York. FRED M. JONES.

Slave Farmers Blamed

HOARD'S DAIRYMAN:—Having just read Mr. Jones of Maine on the Wing article, I would like to ask of Mr. Jones why he milks his cows three times a day when he has no one to change off with and why he goes to work at 4 a. m. If men of this stripe would cut their hours to more reasonable ones and use this part of their time for rest or recreation, they and all the rest of us would be much better off. I maintain that the farmers who are making of themselves such slaves as Mr. Jones describes himself to be are the farmers who are most to blame for the low prices the farmers receive, in that they are most responsible for the overproduction and surplus of all farm products. His "think it over" is a boomerang that hits the bull's eye nicely.

New York. J. B. CRESWELL.

Clover Should Live

HOARD'S DAIRYMAN:—I like your editorial "Bring Back Clover". It can be done beyond any doubt and red clover is too valuable to be condemned to death by scientific (?) superstitions. The younger agronomists are waking up and beginning to see things that were before invisible because they had been blinded in the class room by wild guesses and false theories fed to them as great truths that must be held sacred. Your editorial marks a long step forward in American agriculture. The iconoclast has often worked terrible destruction but he has his uses.

Florida. CHAS. F. LEACH.

Saving mother's eyes

In this age of electricity the General Electric Company's monogram has marked the trail of electrical progress. You will find it on the giant generators used by lighting companies; on outdoor lighting systems; and even on the lamps and little motors that mean so much in the home. It is a symbol of useful service.

The new G-E Farm Book, giving interesting facts on the subject of farm electrification, will be sent on request. Write Section E, General Electric Company, Schenectady, N.Y.; Chicago, Ill., or San Francisco, Cal.

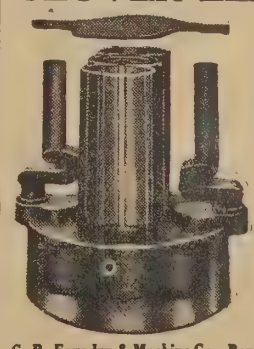
Mother's work—in the kitchen, at the sewing table, upstairs and down—is made easier when electricity enters the home. Electric light saves mother's eyes and banishes the drudgery and danger of kerosene lamps.

Electric lights are a great convenience, too, around the farm buildings, on the driveways, and out on the highway.

GENERAL ELECTRIC

The Years Have Proven That There Is Nothing Like

Reg. U. S. Pat. Off



Brown's Beach Jacket

for wear, warmth and comfort

The same good quality of material and care in manufacture which first gave it its reputation make it the best cold-weather garment of its kind today. It has an almost wind-proof exterior with knit-in wool fleece lining and is made to fit the body snugly, yet allowing perfect freedom of movement. It wears like iron, can be washed and keeps its shape. Three styles—coat with or without collar, and vest. Ask your dealer

BROWN'S BEACH JACKET COMPANY, Worcester, Massachusetts.

CLOVER LEAF OIL BURNING TANK HEATER

—Blue Flame—

No ashes, smoke, or sparks. Requires attention but once a day. Costs less to operate. Will last a lifetime. Keeps drinking water at proper temperature at all times. TODAY — write for illustrated circular and testimonials.

C. R. Foundry & Machine Co., Box 20, Cedar Rapids, Iowa

Dehorn with the Keystone

Dehorn your cattle in the modern humane way. No crushing—a single stroke does the work. Dehorned cows and steers are gentler.

The Keystone is sold on a money-back guarantee. We also make Keystone Bull Staffs. Write for circular.

DAIRY MARKET NEWS

Cheese Markets

(Report by U. S. Dept. of Agr.)

Cheese markets were firm and active during week ending Nov. 15. Decreasing production was an important influence; active buying also supporting situation. Storage holdings on November 1 were reported as 67,651,000 lbs., a surplus of 9,724,00 lbs. over last year. This is not a cause of concern.

The average wholesale prices on American cheese, style Twins, for the week ending Nov. 15, 1924, for the corresponding week a year ago, and for the previous week were as follows:

	Ave. for the week ending Nov. 15 1924	Nov. 8 1924	Nov. 15 1923
	Cts.	Cts.	Cts.
New York	21.0	20.5	25.2
Chicago	19.1	18.8	23.3
Boston	21.5	21.5	26.5
San Francisco	19.8	19.2	26.0
Wisconsin Boards	18.7	18.1	23.8

The receipts of cheese at these markets were 3,612,631 lbs. for the week as compared with 3,410,913 lbs. last week and 3,653,324 lbs. a year ago.

Cold Storage Holdings

(U. S. Department of Agriculture)

The following is a report of the cold storage holdings of dairy products on November 1, figures being given in thousands of pounds (000 omitted):

	Nov. 1 5-yr.-ave.	Nov. 1 1923	Nov. 1 1924
Butter, creamery	86,113	76,472	135,251
Cheese, American	52,641	57,927	67,651
Cheese, Swiss	4,996	6,094	10,648
Cheese, Brick	1,567	2,535	1,688
Cheese, Limburger	1,063	1,264	1,220
Cheese, all other	8,673	6,482	6,601

These holdings include stocks in both cold storage warehouses and packing house plants.

Butter Markets

(Report by U. S. Dept. of Agr.)

Butter markets were firm and active during the week ending November 15. Fancy grades were especially scarce, resulting in greater interest and more activity in best quality storage butter. Foreign markets were weaker. Monthly storage report released during week revealed total holdings on November 1 of 135,251,000 lbs. as compared with 76,472,000 lbs. last year and a 5-year average of 86,113,000 lbs.

The average wholesale prices on 92-score butter for the week ending Nov. 15, 1924, for the week previous, and for the corresponding week a year ago were as follows:

	Ave. for the week ending Nov. 15 1924	Nov. 8 1924	Nov. 15 1923
	Cts.	Cts.	Cts.
New York	41.2	40.5	53.1
Chicago	39.0	38.5	51.5
Philadelphia	41.6	40.7	53.5
Boston	39.5	39.0	51.5
San Francisco	38.5	37.9	48.6

The receipts of butter at these markets were 8,579,391 lbs. for the week as compared with 9,354,201 lbs. for last week and 9,488,847 lbs. a year ago.

CHICAGO, Nov. 20—Butter was in good demand with prices here unchanged to ½c higher. Offerings were not large and readily taken. New York was firm and Philadelphia unchanged to ½c higher.

Cheese markets generally unchanged.

Fresh eggs sold at unchanged prices. Receipts were 2,746 cases. Sales at 225 cars refrigerator standards for December delivery were made at 36¼@37c.

FOND DU LAC, Wis., Nov. 17—Average cheese prices (majority of sales), f. o. b. shipping point: Flats, 19¼c; Twins, 18¾c; single Daisies, 19½c; double Daisies, 19¼c; Longhorns, 19¾c; square prints, 21c.

PLYMOUTH, Wis.—Cheese prices established on Cheese Exchange Nov. 15—Single Daisies, 18¼c. On Farmers' Call Board Nov. 14—Singe Daisies, 18½c; Longhorns, 18½c; square prints, 19¼c.

NEW YORK, Nov. 19—Butter—Firmer; receipts, 10,968 tubs; fresh supply, 56,474 tubs; creamery extras, 44c; specials, 44½@45c.

Eggs—Firm; receipts, 5,968 cases; fresh supply, 80,792 cases; white, fancy, 81@84c; fresh firsts, 50@65c.

National Dairy Union Meeting

At the annual meeting of the National Dairy Union held at Mason City, Iowa, during the annual convention of the National Association of Creamery Buttermakers, N. P. Hull of Lansing, Mich., was re-elected president and A. M. Loomis of Washington, D. C., secretary, I. R. Morley of Owatonna, Minn., vice-president, and George Caven of Chicago, treasurer. The other directors are Samuel Schlosser, of Indiana, re-elected, and G. R. Kingsley of Iowa elected in place of C. V. Huenke of Ohio, whose term had expired.

The report of the treasurer showed about $3,500 cash balance and receipts of slightly more than the expenditures for the year. The report of the secretary covered the legislative activities of the year including work for the Bureau of Dairying, Butter Standards Act, co-operation with Internal Revenue Bureau in oleomargarine law enforcement work with Tariff Commission to uphold tariff rates on vegetable oils, etc. The secretary's salary was reported at $1500 a year and all his office and other expenses of the Washington office at $3,034.45.

The National Dairy Union began on Oct. 1, 1924, its 22nd year of active service for the interests of the dairy industry and the suppression of false and fraudulent methods of manufacture and sale of imitation dairy products. Going back in its history to the foundation laid by Ex-governor Hoard and his co-workers for the industry it is still finding plenty to do to carry on the never ending fight against fraud, imitation, and substitution. Its support comes from voluntary memberships which are solicited wherever dairy products are produced. A. M. LOOMIS, Sec'y.

There is Copper in *this* Steel Wire

In order to resist rust clear to the core of the wire, we use *copper-bearing* steel. 15 to 30 points copper in steel makes the wire last many years longer.

Every rod of Square Deal Fence is now made by the patented "Galvannealed" process, which means welding 2 to 3 times more zinc *into* the wire than is applied by the ordinary Galvanizing method. This, together with copper-bearing steel, guarantees Square Deal to outlast all others.

Galvannealed **Square Deal Fence**
(No Extra Price)

is marked with a *Red Strand*. Always look for it. This fence made of the "Triple-life wire" is sold at *no extra price*.

Nationally recognized authorities such as Indiana State University, Burgess and Hunt Laboratories, show in their "Official Tests" that "Galvannealed" greatly out-tests any other farm fence.

FREE: Write today for these proofs. Also get our catalog and Ropp's Calculator. All 3 free to landowners. Address:

KEYSTONE STEEL & WIRE CO.
1751 Industrial St., Peoria, Ill.

Outlasts any other Farm Fence!

(Continued from page 605)

Boy, was junior champion. Gem's Best, a junior heifer calf dropped in February, was the junior champion female. Nellie B. Cook, a big, roomy individual, was senior and grand champion female.

Judge—A. C. Oosterhuis, Wisconsin

Exhibitors: A. Grossen, Joe Schumacher, T. Brugger & Son, John Boeckli, Anna Marie Boeckli, Oregon.

The awards are as follows:

Bull 4 years old or over—1, Brugger & Son on Jessie's Lot; 2, Boeckli on Sunny Hill Bob. Bull 2 years old and under 3—1, Grossen on Tassa M's Beauty. Junior yearling bull—1, Brugger & Son on Admiral A. Senior bull calf—1, Boeckli on Bachtel. Junior bull calf—1, Brugger & Son on Gresham Boy.

Cow 5 years or over—1, Grossen on Nellie B. Cook; 2, Boeckli on Emme; 3, Brugger & Son on Brown Rosaline. Cow 4 years old or over—1, Brugger & Son on Lucille; 2 and 3, Boeckli on Rhone and Rhein. Cow 3 years old under 4—1, Grossen on Daisy Alice; 2, Brugger & Son on Bella T. Cow 2 years old under 3—1 and 2, Boeckli on Saanen and Kander. Senior yearling heifer—1, Brugger & Son on Lillian Glen. Junior yearling heifer—1, Boeckli on Delia H; 2, Brugger & Son on Lucille 2nd. Senior heifer calf—1 and 2, Brugger & Son on Winter Rose and Hulda Telle. Junior heifer calf—1 and 2, Brugger & Son on Gem's Best and Lilly 2nd; 3, Boeckli on Sunny Hill Dairy Maid.

Cow having official yearly record begun at 5 years or over—1, Grossen on Nellie B. Cook; 2 and 3, Boeckli on Aare and Limmat. Cow having official yearly record begun under 5 years of age—1, Boeckli on Rhone; 2, Boeckli on Saanen. Get of sire—1, Brugger & Son; 2, Boeckli. Produce of cow—1, Brugger & Son; 2 and 3, Boeckli. Young herd and calf herd—1, Brugger & Son. Dairy herd—1, Brugger & Son; 2, Boeckli.

Senior and grand champion bull—1, Jessie's Lot. Junior champion bull—Gresham Boy. Senior and grand champion female—Nellie B. Cook. Junior champion female—Gem's Best.

Boys' and Girls' Dairy Exhibits

There was a one hundred per cent increase in dairy stock entered by boys' and girls' club members in competition for awards totaling $1,000 in prize money. Each exhibitor in these classes is required to be regularly enrolled with his state club leader and shall be between the ages of nine and eighteen years. Exhibitors may make but one entry in any one class. A feature of this department is the series of showmanship contests taking place among exhibitors of Jerseys, Holsteins, and Guernseys.

Some remarkably good young stock was exhibited by the boys and girls. A few of the entries would have stood fair chances in the open classes but at this show entering in both club and open classes is not permitted and every effort by the young people is directed toward increasing the value of the junior show.

Twenty-five young people entered Jerseys. The best class was the senior calf class, with nine entries, in which competition was keen. Orval R. Loe, Oregon, took first in this class with a splendid bull calf, Chieftan's Little Lou; second and third place winners were Alvin G. Tillman, and Viola Tau, Oregon. Rudolph Hanson and Kenneth Kesterson, Oregon, showed mature cows which they had raised, the former lad showing Oxford Lassie of Lawn Vista, slightly out pointed his competitor's entry, Poppy of Sunnyfields. The junior calf award went to a nice St. Mawe's heifer owned by Kenneth Kesterson. The $25 showmanship prize went to Edith Pugh, Oregon. Herbert Kanne, Oregon, was second.

Twenty-six club members exhibited Holsteins. In this competition the senior calf class was also the strongest, with the junior calf class pressing closely. Winners in these classes were: John H. Fleming, Oregon, on King Segis Matador Abbekerk and Carroll Madsen, Oregon, on Mercedes Von Holmgen De Kol. The showmanship contest here was won by Lawrence Aylsworth, Oregon, with John Fleming second. The Hollywood Farm prize of a Holstein heifer calf made to that club member scoring highest on the basis of quality of calf, herdsmanship, showmanship, and record book was won by Marvin Daniel, Oregon.

Guernseys were shown by twelve young people. Most of the entries were in the calf classes where the outstanding individual was Glen Hilda May of Greenacres, exhibited by Karl Zweiful, Oregon. Edwin Ridder, Oregon, won the Guernsey showmanship contest. Karl Zweiful was second.

For the first time there were club entries of Brown Swiss. Five exhibitors composing the membership of a single club in Multnomah County, Oregon, exhibited their charges.

A Promise to Dairymen

The quality of Larro will never be lowered so long as Larro is made. Regardless of what changes take place in the price of ingredients, Larro will always remain the same.

LONG ago we decided upon this policy, and wrote this pledge into our manufacturing creed.

There were two reasons for this decision—we knew it to be correct, both in theory and practice, and we knew we could keep the promise.

Years of experiment and practical feeding have proved that a dairy feed must be more than just "a good feed." It must also be absolutely uniform and its formula must not be changed.

Sudden changes in feed—putting in more of this, or less of that, the substitution of poorer ingredients, imperfect blending or mixing—result in lower milk yield and smaller profits for the farmer.

Your cows do not eat a printed formula. They are not concerned with price changes. Whether the market is high or low, they need a feed that will build condition and keep milk flow at its peak.

The Larrowe Milling Company is able to keep its promise of uniformity and unchanging formula because it has the experience and equipment to manufacture a feed that never varies. It has a formula that can be depended upon to produce milk profitably. This formula will never be changed unless the Larro Research Farm proves that a better one has been found.

LARRO is *more* than a *good* feed; it is always the *same* feed.

We repeat that we shall continue to manufacture LARRO on this basis—the basis of more profit to those who buy it.

THE LARROWE MILLING COMPANY
DETROIT, MICHIGAN

THE SAFE RATION FOR DAIRY COWS

MR. FARMER How About That Corn Still to Husk ?

Buy an OHIO SHOCK HUSKER and quit your worry

It husks from the shock, hooks behind the wagon, saves the fodder; use in either wet or dry weather, keeps you warm in cold feeding it; remove engine and use for other farm power work. Don't delay but write today for our farmer dealer proposition.

THE OHIO HUSKER CO., Doylestown, Ohio

Milk Record Sheets

For years Hoard's Dairyman has been preaching the necessity of keeping records of the production of each cow. Only by knowing how much milk each cow actually gives is the dairy farmer able to improve his herd. Our Book Department has various sizes of milk record sheets to make it easy to keep tab on your cows. Complete samples with price list will be sent for 5 cents in stamps. Address Hoard's Dairyman, Fort Atkinson, Wis.

The sting of a reproach is the truth of it.—Proverbs of England.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR DAIRY FARM GIRLS AND BOYS

Boys' and Girls' Fairs Help Build Communities

Fall time is fair time. Why not? After a hard summer's work, what better way is there to "finish off" than to exhibit at a fair or round-up? What better way is there to promote neighborly spirit and build the community? There are thousands of communities that could benefit by this sort of a program. Hundreds of communities do. Many have just as good or better fairs than those reported, but here are three types of round-ups, built around the work of boys and girls. May your community be

Jimmie Perry, 12-year-old winner at Waterloo. One pie pumpkin weighs 45 lbs. and the other 50 lbs.

one of those to benefit by a get-together.

Fort Atkinson and Waterloo are two neighboring communities in Wisconsin. Both have a Smith-Hughes agricultural teacher in the high school. Both communities held a two days' fair this fall. Both communities believe in co-operation.

Waterloo held its community fair first. This offered a good opportunity for Fort Atkinson boys to visit Waterloo's third annual fair and get some ideas. N. O. Eckley, agricultural teacher, and Miss Natalie Leonardson, home economics teacher, directed the fair. It was supported by town and country alike and was held for two days in tents right in the down-town district. Banks and business men contributed more than $200 in prize money. Hundreds of visitors passed through the demonstration and exhibit tents during the two days.

It is said that Mr. Eckley is the originator of the demonstration booth idea for high school fairs. In accordance with this plan, there were ten booths on one side of the tent to demonstrate the best agricultural practices and ten more on the other side of the tent to demonstrate the better practices in household management. In the agricultural department regular demonstrations were given by the boys on the following subjects: seed corn and its testing, rope work, milk testing, soil testing, culling poultry, feeding poultry, alfalfa the connecting link, grading and marketing eggs.

H. A. HOVDE

On their side of the tent the home economics girls demonstrated the proper method of serving meals, helpful hints in home decoration, better health, the "tie and dye" process, sewing methods, milk for health, the six best doctors.

One of the features given by the home economics students was the style show held in a down-town store window. In the "evolution of clothing" booth were displayed a variety of gowns from those designed and worn seventy-five years ago down to present day styles.

There were other competitive exhibits. The boys competed in grains, vegetables, fruit, and live stock including pigs, sheep, dairy and beef cattle. The poultry show with more than seventy-five entries was the largest ever held in connection with the Waterloo High School Fair. The girls showed baking, canning, candy, and sewing.

More than ninety boys and girls took part in the fair. Officials of the High School Fair Association were: Agriculture, Fred Kypke, president; Clarence Motl, vice-president; Russell Fox, secretary; Melvin Else, treasurer. Home economics, Gertrude Behl, president; Matilda Vartosch, vice-president; Jeanette Wendt, secretary-treasurer.

On the evening's program were talks by the Superintendent of

Directors of the Waterloo High School Fair, Miss Natalie Leonardson and N. O. Eckley.

Schools; L. F. Graber of the Wisconsin College of Agriculture; L. M. Sasman, state supervisor of Smith-Hughes agriculture; entertainment by local talent, and a poultry picking demonstration by Ernest Hausen of Fort Atkinson, the world's champion poultry picker, who equalled his world's record of four and three-quarters seconds at this exhibition.

Different, yet similar, was Fort Atkinson's High School Community Fair. There were more than 228 entries of vegetables, grain, and fruit from high school boys and girls, farm boys and and girls, and farmers in this community. Entries were open to everyone in the community. The first annual fair at the Ft. Atkinson High School was held in the high school gymnasium and supervised by H. A. Hovde, agricultural teacher. The project boys demonstrated testing milk, soil, grafting trees, culling poultry, and rope work.

A distinctive feature of the fair was the weed identification contest in which sixteen rural schools in the vicinity of Fort Atkinson participated. A team of three pupils represented each school and nearly sixty boys and girls actually took part in the contest. For several weeks previous to the fair, Mr. Hovde and his students made regular trips each week to the country schools and

Fort Atkinson High School "Ag" Club. These boys helped make their fair a success. Officers for the fair, front row, right to left, Howard Purdy, Vernon Loga, Herbert F. Wisch, Victor Stroebel.

taught the boys and girls to identify a large number of weeds. The contest allowed forty-five minutes for the identification of eighty-five different weeds. Delta McGoon identified eighty-three of the eighty-five weeds correctly. The winning school identified a total of 233 out of a possible 255. A handsome banner was presented to the winning school as a trophy and the highest individual was presented a beautiful gold pin.

Agricultural Club Fosters Fair

The evening's program was held in the auditorium of the high school where talks were given by A. J. Glover, editor of Hoard's Dairyman; E. M. Tiffany of the Wisconsin College of Agriculture; and J. M. Coyner, Jefferson County Agent. Musical numbers were given by a male quartette and the high school orchestra. The program was concluded by a chicken picking demonstration by Ernie Hausen, world's record poultry picker. The birds were auctioned off.

Great credit for the success of Fort Atkinson's first community fair should go to the High School "Ag" Club and every one of its members who worked hard on this event. Herbert F. Wisch is president of this club. The other officers are Vernon Loga, vice-president; Oscar Schultz, secretary-treasurer; Harlow Gsell, Victor Stroebel, and Howard Purdy, directors; H. A. Hovde, adviser.

In Wood County, Central Wisconsin, there are nearly 1,000 club members. One of their supervisors is A. N. Howalt, a "full time" Smith-Hughes man. He devotes his entire time to agricultural work among the juniors. Naturally with such a large number of young people interested in project work there should be a fall round-up. And such was held at the Wood County Agricultural School one day in September.

A large display of agricultural products raised by the boys and girls was one of the outstanding features of the program. In the morning there was an inspection of the school and of the school plots. At 1 p. m., after a picnic lunch, the athletic events opened competition for individual and school honors.

The boys' events included: 100-yard dash, high jump, shot put, and broad jump, and the boys were divided into three classes (1) over 100 lbs., (2) 100—130 lbs., (3) under 100 lbs. The girls competed in a 50-yd. dash, potato race, broad jump, and base-ball throw and were classed (1) over 100 lbs., (2) under 100 lbs. The open-to-all athletic events were: wrestling (lightweight 85—100 lbs.; heavyweight 120—160 lbs.); half-mile relay (4 men to a team), tug of war (5 men to a team).

A part of the grain and forage crops exhibits at the Fort Fair—dumb bells and Indian clubs in the background on the wall of the gym.

Following the track meet there

Waterloo High School boys gave a good fair. Fair Association officers front row, left to right, Melvin Else, Clarence Motl, Fred Kypke; second row, Russell Fox (left).

Rural school boys and girls with their teachers who helped make the weed identification contest a success at the Fort Atkinson Community Fair.

were talks by C. H. Hill, superintendent of the Wood County Rural Normal and Agricultural School, and L. M. Sasman, a corn demonstration by special team, a song by a male quartette and "movies".

Many of the prizes for the athletic contest were donated by city merchants. A pennant went to the winning farm school group, and was won by the Milladore group. Ernest Fait won the prize as the best project worker, a year's scholarship at the Wood County Agricultural School. Clarence Becker was declared second best project boy.

Thus you have another type of round-up. It might be added that Mr. Howalt has had a number of successful community fairs in the rural schools of Wood County this fall, and that he plans to follow up with Federal Farm Schools in many of these districts this winter. This "federal farm school" is a two weeks' course in dairy husbandry. These subjects will be discussed: 1, feeds and feeding; 2, balancing rations; 3, actually mixing feeds; 4, practical testing of a local herd; 5, keeping records; 6, dairy organizations; 7, problems; 8, auto mechanics. The course is open to all, but boys and girls in the community who are not in any other course are especially urged to come.

Our Weekly Review

(Each week, boys and girls, in this column we want to give you a little review of Hoard's Dairyman for the previous week. Here is where we have a chance to talk it over. The Junior Editor would like your opinion on this column.)

Alfalfa may truly be called the wonder crop. As a soil builder it is hard to beat. It has the power to take nitrogen from the air and convert it into food available for plants. Its root system keeps the soil in good condition. Alfalfa is one of the finest dairy feeds known. There now comes a third jewel for its crown. It is a weed killer. This and many other useful things you will learn from the November 21st issue of Hoard's Dairyman.

Tell about A. W. Oxley's experience with alfalfa. Mr. Oxley had a ten-acre field where Canada thistles reigned supreme. He planted the field to alfalfa and the following year the thistle crop was a thing of the past.

What has alfalfa done for Mr. Oxley? Besides helping him get rid of the thistles, it has made possible the economical production of butterfat. In 1923 for every dollar's worth of feed the cows consumed, he received more than two dollars' worth of butterfat.

Give Mr. Snoddy's idea of successful farming. This Ohio farmer had the largest labor income for 1923 of all the farmers who kept farm accounts with the Ohio State University. This he accomplished on a farm of seventy-six acres, sixty-three of which are tillable. His labor income for last year was $3,092.00. His idea of successful farming is not how many acres and cows, but fewer and better acres and cows.

Explain briefly the Whatcom plan of testing. Out in the state of Washington, Whatcom County dairymen wanted some method of testing, but did not want the regular association form. The plan they are following lays the county out in ten routes with a total of 1,725 cows and 160 members. Each member collects his own samples and weighs the milk. The tester makes two trips each month to the farms of the district collecting and distributing sample bottles. He does the testing himself in a creamery and sends his figures to the state college of agriculture to be compiled. From these figures he makes recommendations for improved practices to individual farmers. The tester is supported jointly by the extension service of the state college of agriculture and the cow testing association.

Turn Your Eyes to America's Cheapest, Richest Land

WESTWARD the tide of American development flowed in the century that is gone. First the explorers, then the buffalo hunters, then the settlers in their prairie schooners, eager to homestead on free, virgin land.

Today, the sons of those Western Pioneers are surrounded by civilization and close settlement. Their farms are located on high-priced land.

But where is the heritage of Opportunity for the sons of the *present* generation? Where is the cheap, rich land of today? Look to Canada!

Just over an imaginary line lies the Dominion of Canada, with the richest undeveloped area of agricultural land on the continent of North America. Low-priced, rich, virgin lands along the railroads—$15 to $20 per acre—are the heritage of to-day.

With 300 million acres some day destined to be plowed, less than 60 million are as yet under cultivation.

There—in Canada—lies your Opportunity. The spirit that made the West for your father's sons is calling *you* for sake of *yours*.

Canada is a good country to live in—a country easily accessible to the markets of the world—a country of over 40,000 miles of railroads—a country of democratic self-government, of security of life and property, and even-handed opportunity for all who are willing to work for their success. Canada is the original home of Marquis wheat. Canada grows the best oats and barley. Live stock thrive in Canada. Canadian bacon and dairy products compete successfully in the export markets of the world.

Canada's export trade, per head of population, ranks third among all nations. Canada's development is almost without precedent. Canada is a young giant of a country just realizing its own strength. Look to Canada!

The Canadian Government's Land Settlement Service, with its system of directing and locating settlers on suitable lands and looking after them until they are comfortably settled, is available to you *without cost.*

Take your pen or pencil and print your name and address in this coupon and mail it to us. We'll send you illustrated literature on Canada with complete information. You should have this information. Fill out the coupon. Mail it TODAY. The Opportunity you seek lies before you in CANADA.

Junior Letters

My Experiences in a Calf Club

Hoard's Dairyman Juniors:—I have been in the calf club work for three years and I like it fine. In this work I have learned how to feed and raise dairy calves.

I joined the first year with a pure-bred calf which my father bought. The next year I took the same one as a heifer and the third year she was a cow. I took her calf and this year I am taking her second calf.

All these years I have been feeding my calf silage, ground feed, oil meal, and skimmilk and lead her to water twice a day. I also give her all the hay she will eat.

Just before show last year I washed her and clipped her and polished her up for show I have earned $21 clear prize money from the last three years' experience. My address is R. 1, Box 16, St. James, Minn.

Clarence Nelson.

Sells Garden Stuff—Swells Savings

Hoard's Dairyman Juniors:—I received the charm, button, and creed and am very delighted with them and show them to all the boys.

I am getting along very well with my poultry club work. Next year I am going into the calf club. I have some fine calf now, but I am not old enough to join the club. We have had quite a warm summer, but papa says not so hot as Wisconsin as he was born there and lived there for 22 years. We have one of the finest farms in the West. I am going to send you some pictures of it a little later. There are 380 acres. We farm to wheat, hay, and cattle. I have a fine garden. I live right at Mica so sell my garden truck right from house to house every morning which helps to swell my saving account.

I would be glad to hear from some juniors. I am 10 years old and in the 5th grade. I have no brothers or sisters, so you can see I enjoy getting a letter from a junior. Wish all Hoard's Dairyman Juniors the best of luck. My address is Lock Box 15, Mica, Wash.

Elvin Bloom.

How to Become a Junior

Any boy or girl under twenty years of age may become a member of the Hoard's Dairyman Juniors' Club if one member of the family is a regular subscriber to Hoard's Dairyman. It costs you absolutely nothing to join.

In applying for membership, state your name, age, address, favorite dairy breed, your father's name and initials, and to whom Hoard's Dairyman is addressed at your home. Are you a member of a boys' and girls' agricultural club? If so what kind? Be sure to write plainly and give desired information in full.

All regularly enrolled juniors are sent the emblems of the Hoard's Dairyman Juniors' Club—the badge (a watch fob for boys, a necklace for girls), the button (showing the head of your favorite dairy breed), and a handsome creed. Mail your membership application *at once* to Junior Editor, Hoard's Dairyman, Fort Atkinson, Wis. Do it now.

The rate for advertising in this department is 10 cents per word. Count address. Remit in advance. Copy must reach us 8 days ahead of date of issue. Farm labor advertising 7c per word.

STOCK FOR SALE

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wisconsin. 12-*

Holsteins For Sale—Will have to sell a number of young cows cheap; also some heifers and calves; all stock tuberculin tested. Write for particulars. E. F. THOMAS, Oconomowoc, Waukesha Co., Wis. 11-*

Milk Producers—Let us figure with you on a load of Holsteins or Guernseys. Clean stock, heavy producers. Write or call EDGEWATER STOCK FARM, Fort Atkinson, Wis. 5-*

I am offering my entire herd of Holsteins for sale. 15 cows, 1 two year old heifer and two year old bull. All freshen this fall and early winter. Will take $1,250.00 for herd. Peter Forceth, Waupaca, Wisconsin. 14-*

For Sale—Registered Holstein herd. 37 head. Price $5,000. 24 from 35 lb. sire, 9 from 30 lb. sire. No abortion or tuberculosis. Herd must be sold. MAX WITTE, Route 5, Watertown, Wisconsin. 15-*

Son of Matador Segis Walker from year record daughter of Johanna McKinley Segis for sale. He is three quarters brother to Matador Segis Walker 6th. 4 years old and guaranteed to be right in every way. We have 25 of his daughters in our herd which is federal accredited. GLEN RAMSEY, Fort Atkinson, Wisconsin. 18-4

For Sale—Fresh and springing T. B. tested Holsteins. JOSEPH FISHER, Janesville, Wis. 18-3

An Unusual Opportunity—going to discontinue farming and will dispose of entire herd of pure bred Holsteins at less than ½ of value. 1 bull, a winner of several first prizes and grand championships in 1923, 3 yearlings, 9 five to ten months old heifers, 20 two to five year old cows, many granddaughters of son of 37th. This herd has been bred up for years and will be sacrificed for immediate disposal. Write P. B. KNILANS, Mgr., Fort Atkinson, Wisconsin. 19-2

Holstein Bulls, all ages by 100 pound milk and 40 pound butter sires. Farmers Prices. ROY HARRIMAN, Appleton, Wisconsin. 14-spl

For Sale—My entire herd of 70 high grade Holsteins, own raising. Must sell at once. Bargain. Would exchange for high grade Guernseys T. B. tested. Am going in the bottle milk business. MEURER'S STOCK FARM, Genoa City, Wis. 20-*

Colorado Holsteins. High grade yearlings $25.00; twos, $40.00; young cows, $65; registered cows, high record bulls cheap. W. A. NORRIS, 1566 Kearney St., Denver, Colorado.

Registered Holstein bulls and heifers, one to twelve months. PAT WALSH, La Valle, Wis. 20-2

For Sale or Trade—Two 1000 yearly record bulls for grade or pure-bred cows. OSCAR WESTERHEIDE, New Douglas, Ill. 20-*

From Federal Accredited herd. Nice, well bred, registered Holstein bull calves from record dams. $40. WARD BROTHERS, Fort Atkinson, Wis. 19-2

Registered Guernsey heifers and bull calves. FAIRVIEW FARMS, Brodhead, Wis. 13-*

Oakland Guernsey Farm—(Since 1890) Mukwonago Wisconsin, offers carload high grade Guernsey springers, choice of our herd. T. B. tested, 5-six weeks old heifer calves $150, express paid. 24-*

Young Guernsey Bulls, A. R. breeding. Federal accredited herd. MATH. MICHELS, Peebles, Wisconsin. 24-*

Carload heavy springing Guernsey cows for sale. SHAMBEAU & KENYON, Waupaca, Wis. 10-13

Choicely bred Guernsey male calves from three months to serviceable age. May Rose and Cherub breeding. L. S. MEYER, Springfield, Missouri. 15-13

Registered Guernsey bull calves from high testing dams. Accredited herd. Reasonable prices. QUINEILLO FARMS, Thiensville, Wis. 23*

Two Serviceable Guernsey bulls for sale whose dams and sires' dam average 705 lbs. fat. HOMER RUNDELL, Livingston, Wis. 18-*

Jo Daviess County Guernseys. Grandson of King of Chilmark selling at auction Thursday, December 4th at Elizabeth, Illinois. Send for sale list. DONALD L. BRYSON, Secy. 19-2

My Herd of Heavy Producing Guernseys. 6 registered cows, 9 high grade cows, good herd sire. Price $2,300 for herd. T. B. tested, a good, clean herd. C. J. FRIES, Ogdensburg, Wis. 19-2

For Sale—Advanced Registered bull, fourteen per cent May Rose blood. Good individual, sure breeder. ROBERT HARGROVE, Roberts, Wis. 20-spl

City View Farm offers for sale Guernseys, male and female, of all ages; May Rose Langwater breeding out of good A. R. dams Federal accredited herd. O. R. SCHWALEN, Roberts, Wis. 20-*

Rundell and Nicholson Dispersal sale December 19 at Livingston, Wisconsin. 56 pure bred Guernseys, 5 bulls, 51 females. See adv. next week. CHAS. A. WILKINS, Sales Manager, Platteville, Wis.

Pure-bred and high grade heifers and calves for sale. Also high grade Guernsey cows. A. B. RAYBURN, R. 3, Litchfield, Minn. 20-3

Advanced Register Guernsey bull whose two daughters made 454.88 and 578.13 lbs. fat in class G. Fine type. Sure breeder. A. E. PLEASANT, Beebe, Ark.

Grade Guernseys—Tuberculin tested. Carload of springers for sale now. Select what you want from my herd. LEE BURLINGHAM, Dousman, Wisconsin. 20-spl

Fifteen registered Guernsey cows and heifers. Bred to a son of Cherub's Prince. For prices write INLAND DAIRY FARM, Little Falls, Minn.

Wanted—Well bred Jersey calves. ARTHUR OTTO, Tulare, South Dakota.

Four Registered Jerseys. Herd sire a prize winner at state fair, record dam. Two cows, one with record. Yearling heifer. Majesty and Noble of Oaklands breeding. BERT McREYNOLDS, Normal, Ill. 19-2

For Sale—Two pure bred Brown Swiss bulls and one bred heifer. Also my herd bull. A. L. BURDEN, Coleman, Mich. 19-2

STOCK WANTED

Wanted—Thirty high grade Guernseys, young and T. B. tested. State best cash price; must be a bargain. MEURER'S STOCK FARM, Genoa City, Wisconsin. 20-*

STOCK BUYER

Holstein-Guernsey—Will assist you in buying dairy cattle of any kind, grade or pure bred. GEORGE McELROY, Hortonville, Wis. 14-tf

Stock Buyers—Let us buy you a load of Tennessee best Jerseys, ready to freshen, delivered to you at Seventy-five Dollars per head. WHITFORD BROS., Kendallville, Indiana.

HAY

Alfalfa Hay For Sale—A. B. CAPLE, Route 3, Perrysburg, Ohio. 4-*

Hay, Straw and Alfalfa—Write us for prices. Consignments solicited. Prompt returns. Inquiries answered. J. A. BENSON CO., 332 S. La Salle St., Chicago. 12-spl

Dairy Alfalfa and Prairie. Delivered prices. SUTTIE PEDERSON CO., Omaha, Nebr. 8-17

Alfalfa or anything you want in dairy hay. Write or wire for prices. HARRY D. GATES COMPANY, Jackson, Mich. 9-*

Dairy Clover, alfalfa and grain. Write or wire for delivered prices. CALLIARI BROTHERS, Green Bay, Wisconsin. 17-*

Alfalfa hay for sale, all shock cured. Car lots. CHAS. B. WING, Box 21, Mechanicsburg, Ohio. 18-*

Alfalfa Hay For Sale—Write for delivered price, ALBERT MILLER & COMPANY., 192 No. Clark St., Chicago, Ill., or call our representative LaCrosse, Wisconsin. Telephone 851-A. 19-*

MINERAL FEEDS

All livestock need mineral matter. Kay's Mineral Feed, a supplement to the grain ration, builds bone and increases production. One hundred pound trial sack, $5.00. KAY MINERAL MILLS, Wauwatosa, Wisconsin. 15-10

TOBACCO

Homespun Tobacco. Chewing, 5 lbs., $1.50; ten, $2.50. Smoking 5 lbs., $1.25; ten, $2.00. Pay when received, pipe and recipe free. FARMERS UNION, Paducah, Kentucky. 17-4

Homespun Tobacco—Chewing five pounds, $1.50; ten, $2.50; smoking, five pounds, $1.25; ten, $2.00; pipe free, pay when received, satisfaction guaranteed. CO-OPERATIVE FARMERS, Paducah, Ky. 19-4

Homespun Tobacco—Chewing five pounds, $1.50; ten, $2.50; twenty, $4.50. Smoking, five pounds, $1.25; ten, $2.00; twenty, $3.50. Pipe free. Money back if not satisfied. UNITED TOBACCO GROWERS, Paducah, Kentucky. 20-4

SEEDS

Lespedeza Seed, recleaned, $5.00 bushel. J. F. BLANCHARD, Brighton, Tenn. 20-2

AGENTS WANTED

Yes Sir, we have a special opportunity for you during spare time, an opportunity to do some good work in your neighborhood, for the betterment of dairy farming, that will pay you in cash for the effort you put forth. Write for our "Special Opportunity Getting Together" folder. Address HOARD'S DAIRYMAN, Fort Atkinson, Wisconsin. 2-tf

Agents Wanted in Wisconsin to take orders for Agricultural Limestone. No experience necessary. Good commission. Farmers preferred. WAUKESHA LIME & STONE COMPANY, Waukesha, Wis. 15-25

Liberal Commission to Farmers in Wisconsin. Take orders for Superior Agriculture Limestone. Easy and profitable. Write WISCONSIN LIMESTONE CO., National Exchange Bank Bldg., Waukesha, Wis. 19-2

PATENTS

Patent-Sense—Free book for inventors seeking largest deserved profits. Write LACEY & LACEY, 753, F. St., Washington, D. C. Established 1869. 19-52

PRINTING

Use good stationery by all means. Hoard's Dairyman Art Dept. designs your letterhead for 10c. Tell us your breed of stock. Get our free samples and reduced prices on letterheads, envelopes, shipping tags, cards, milk tickets, checks, etc. The best farm stationery money can buy. Book 5,000 farm, ranch and cottage names, 25c. Be sure to give correct post office address and state. Address HOARD'S DAIRYMAN ART DEPT., Ft. Atkinson, Wis. 6-*

MACHINERY

Rubber Tubing for all makes of milking machines. Very highest quality only. Attractive prices to users and dealers. ANDERSON MILKER COMPANY, Randolph, N. Y. 12-*

For Sale—De Laval No. 22 cream separator with motor and capacity tank. JOHN A. MULDOON, 1201 W. Lake St., Chicago, Ill.

For Sale—New De Laval milker. Never uncrated. 3 H. P. Fairbanks-Morse engine for same, new. Will take 25% less than cost. Will sell all or any part. O'NEIL DAIRY CO., Ames, Ia. 20-2

MISCELLANEOUS

Woolens for Sale. Your annual opportunity. For quick disposal we offer salesmen's samples of woolen goods, underwear, hosiery, blankets, sheep lined coats, mackinaws, leather vests, etc., at one-third to one-half less than regular prices. Our price list of sample goods is now ready. Send for it today. MINNEAPOLIS WOOLEN MILLS CO., 612-E-1st Ave. No., Minneapolis. 12-19

Milkmen—Use Fiske's Loose Leaf Route Book. Write for description. P. BAKER FISKE, Attleboro, Massachusetts. 19-3

CREAMERIES

Will sacrifice whole or part of my interest in good going creamery in Washington. Address BOX 362, care Hoard's Dairyman.

DOGS

Farm will produce under proper management $20,000.00 per year. Anyone having help that will work can make good money. I will furnish everything to the right party. FRANK MILES, Rhinelander, Wis. 19-2.

Montana grain farms and stock ranches for sale or rent. Correspondence invited. J. B. GERGEN, Division B, Box 1197, Great Falls, Mont. 17-Spl.

Farm For Sale—100 acres in thriving village. Modern buildings, double house, electricity and city water. Short drive to Buffalo and Niagara Falls, on cement pavement. Only 12,000. CLAUDE PERSONS, Owner, Delevan, N. Y. 19-2

"Wisconsin Opportunities—Free Wisconsin bulletins. Soil climate, crops. IMMIGRATION DIVISION, Wisconsin Dept. of Agriculture, Capitol 25, Madison, Wisconsin." 19-8

Opportunity awaits you in Southeastern Montana. Corn, alfalfa, beans and small grains are dependable crops on Northern Pacific Railway Company's selected low priced lands—20 years to pay at 6 per cent—direct from Company to farmer. Address J. H. COOK, Eastern Land Agent, 803, Northern Pacific Railway Company, St. Paul, Minn. 17-Spl.

First reasonable offer takes the 1,250 acre farm. Has made over 100 bushels per acre. Good buildings, near town. Address owner, J. A. HINSHAW, Pleasantview Apartment No. 2, Kansas City, Missouri. 20-3

Northern Virginia Farms, country estates, near the National capital. BUELL FARM AGENCY, Herndon, Va. Office Herndon Hotel, Phone 38.

160 acre farm with horses, 34 cattle, 150 hens, 60 tons hay, 300 bushels oats, other crops, full machinery included; new 7 room house, 40 cow barn, houses 1500 hens, running spring water; smooth, dark loam fields, big pasture, estimated 700 cords wood worth $12 in market; sugar orchard and fruit; prosperous farmers all around; near lake, large manufacturing town. Owner cannot handle, big value at $5500, part cash. Details page 14, big Bargain Catalog, Illus. money making farms and business chances . Free. STROUT FARM AGENCY, 150DL Nassau St., New York City.

Will Sell 160 acres Wisconsin land, close town, for $2000. Terms. Address BOX 364, care Hoard's Dairyman.

Oregon has many splendid agricultural records. Butterfat records, gold medal bulls, gold medal cows, world record cows. Oregon holds six of the eight Jersey world records for butterfat production. Butterfat produced cheaper than elsewhere because of green feed nearly every month of the year and mild, short winters. Average milk flow per cow one-third higher than in colder countries. Large yields clover, alfalfa, vetch and other legumes. Heavy egg production during winter. Oregon eggs bring 2c to 4c more per dozen in Eastern markets because of superior quality and pack. Successful co-operative poultry association. Banking and business interests united with farmers to provide markets and make agriculture a success. For free bulletins giving official information write Land Settlement Dept., Room 621, PORTLAND CHAMBER OF COMMERCE, Portland, Oregon.

Big Modern Farm. 184 acres, equipment, crops. Highly productive, mild Delaware River, city advantages and markets; 140 acres excellent fields, spring and brook watered, wire fenced pasture, woodland, variety choice fruit; 9 room house, furnace, running hot and cold water, electricity, basement barn, slate roof, other buildings. Can no longer handle, for quick sale will include 34 cows and heifers, 3 horses, sows, 300 hens, valuable equipment, crops, all for $13,400, part cash. L. D. BULL, 90 North St., Middletown, N. Y.

Minnesota has unexcelled markets for all classes of agricultural and dairy products. Come to the sure-crop state, where land is cheap. For free map and literature write OSCAR H. SMITH, Commissioner of Immigration, Dept. 676, State Capitol, St. Paul, Minnesota.

HELP WANTED

Wanted, for fine dairy in Illinois, clean, first class milkers, Hollanders preferred. Job open December 1st. Wages $60.00 and board to start, no quitters wanted. Give references. Address ERNEST LINDSAY, Oak Hill, Illinois.

Wanted—Herdsman on University Farm. $100 per month with house. Married man preferred. State live stock experience. References required. UNIVERSITY OF ARIZONA FARM, Tucson, Arizona.

Want single man to take charge of twenty Holsteins. CHRIS KITTLESON, Zumbrota, Minn.

Wanted At Once—Man with help to operate dairy farm, raise feed and take care Jersey herd, 20 milkers. State salary or share wanted first letter. Address MISS RUBY RICHARDSON, Garnett, S. C.

Help Wanted to take charge of milk house and help in barn on high class dairy. Bottled milk. Must be single, clean, a lover of Jerseys and interested in R. of M. work. Chance for inexperienced young man to learn much. A shifter not wanted. Good home and wages. Tell about yourself at once. C. T. OSCAR SCHACHT, Bloomington, Indiana.

POSITION WANTED

Men—Age 18-40, wanting Ry. Station Office positions, $115-$250 month, free transportation, experience unnecessary. Write BAKER, Supt., 124 Wainwright, St. Louis. 8-*

Position Wanted—Experienced dairy farm manager wants position on up-to-date dairy farm. Willing to take a real proposition on a profit sharing business. Thoroughly experienced in purchasing herds and erecting modern buildings. Now managing the largest dairy farm on eastern shore of Maryland producing certified milk. Address W. A. SIMPKINS, Salisbury, Maryland. 18-*

Position Wanted—as herdsman or farm manager. Twenty years experience in all branches. First class references. Give full particulars. Address BOX 351, Care Hoard's Dairyman. 19-2

Retail driver wants position. Steady, honest and reliable. Or will take charge of a dairy. Address BOX 366, care Hoard's Dairyman.

Position Wanted—By steady, reliable, single man. Experience on retail city milk route. General dairy and some creamery work. Or as second hand in creamery. State wages, etc. Write BOX 361, care Hoard's Dairyman.

Wanted—Position by married man. Educated, and experienced with cattle, hogs and poultry. Address BOX 363, care Hoard's Dairyman.

Single man seeks dairy or farm work. Experienced. I. KRAMER, Euclid, Ohio.

Agricultural college graduate, having ten years experience handling registered Holsteins, desires position with a Holstein herd in California. Address BOX 365, Care Hoard's Dairyman.

Alfalfa Pays

Alfalfa they say
Is a wonderful hay;
And where a man limes
It brings better times.
And let's not be tight
To make the soil right
For, indeed, it well pays
Alfalfa to raise.

It's good for the land;
It grows upon sand,
And to make it real sure
Use lime and manure,
No need to debate
We should inoculate
And once in a while
Give phosphate a trial.

Way up in the sand
And on the clay land
Where marl is applied
It is far from denied
That alfalfa will win.
When clover is thin
You bet that it pays
Alfalfa to raise!

Here are some things
Which alfalfa brings:
It grows on the hills,
It lessens feed bills,
It makes farming pay,
Keeps hard times away,
Puts milk in the pail
When other crops fail.

It grows like a weed
With the right kind of seed.
When drought is around
And fields are all browned
It's green when it's dry
In price it is high.
Yes, indeed, it well pays
Alfalfa to raise.

It's good for the cow
And fine for the sow
It's high in proteins
And rich vitamins.
It's most hard to beat
The calves that do eat
The alfalfa which pays
Most farmers to raise.

Out West it is cheap
The price is not steep.
But we certainly hate
To pay all that freight,
When we grow it at home
With good ground limestone.

And let me say now
To the friends of the cow,
That one of our needs
Is to raise our own feeds.
With timothy away
And alfalfa to stay,
We'll have better days
When we grow the right hays!

—L. F. GRABER.

American Jersey Cattle Notes

For week ending Nov. 7, 1924: Number of animals registered: Bulls, 198; cows, 758; total, 956. Number of transfers recorded: Bulls, 162; cows, 628; total, 790.

VETERINARY

Advice is given free in this department. Inquiries must be signed by the writer, and should pertain to veterinary matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Blood Test for Abortion

Our herd has in the last year become badly infected with infectious abortion. To rid the herd of this disease we are seriously considering carrying out the program outlined by Mr. Simms in your issue of Aug. 29th. We wish to know something of the methods of testing. Can the tests be made on the farm without employing the services of a veterinarian? With our limited barn space and pasture it is next to impossible to isolate successfully. About our only hope as we see it is to rid the herd of abortion infected cattle.

Fairmont, W. Va. J. J. K.

The agglutination and complement fixation tests of the blood have proved of valuable service in controlling the contagious abortion disease. The agglutination test, the one most commonly employed, consists in bringing small samples of the blood serum of the cow to be tested in contact with a suspension of abortion germs or organisms in a physiological salt solution in test tubes and letting it stand for 24 to 48 hours. A positive reaction, indicating presence of the disease infection, causes elements called agglutinins in the blood to agglutinate the abortion organisms in a clump which falls to the bottom of the tube with clear liquid above. If the cow is unaffected no such clumping occurs and the fluid in the tube remains cloudy, as it was when the serum was added. A positive reaction to the test indicates that the cow from which the blood was taken is, or recently has been, infected with the contagious abortion disease. It does not prove that the cow will abort, but indicates that she is infected and may be capable of infecting susceptible heifers and cows with the disease. Isolation of reactors is therefore advisable. The complement fixation test is much more complicated; like the agglutination test can only be done by a trained bacteriologist or pathologist having all the necessary laboratory equipment and is not now commonly employed. A description of the method would have no practical value to the layman. The work of blood testing is undertaken by the veterinary departments of many of the state agricultural experiment stations for a nominal fee reimbursing for a part of the expense involved. Any qualified veterinarian can arrange to have the test made, take the sample of blood from each cow and heifer or heifer calf in the herd, and forward each of the samples in a container furnished by the experiment station experts in the way they prescribe. The blood of the herd bull may also be tested as may the blood of sows, when contagious abortion disease of swine is suspected. The test is reliable when properly done by a trained, experienced expert. It cannot be done by anyone else. Relative to the test and other matters concerning related subjects, we should advise the study of Bulletin 353 of the University of California at Berkeley. Particulars regarding the taking and shipping of samples of blood and the amount of the fee for the testing of each sample may be had by addressing a letter of inquiry to the veterinary department of the agricultural experiment station of the state in which the cattle owner lives.

Garget

I have a cow that went dry, giving thick and watery milk in June. She is to freshen in November. Last year she had milk fever when she freshened. I would like to keep her if there is no danger of losing her when she freshens.

Auburndale, Wis. M. F. A.

The likelihood is that garget will recur at calving and the milk be unfit for use. There is no certain way of preventing that when the disease has been present and germ invasion of the udder has been the cause. Milk fever will be less likely to occur if you have the cow take daily outdoor exercise, feed a light laxative ration. Keep the bowels active and when the calf is born let it nurse the cow for a week. There is little danger of losing the cow.

Fretting is like a rocking chair; you can do a great deal of agitating in it without getting anywhere.—DR. D. E. CROFT.

POULTRY On The DAIRY FARM

J. B. HAYES

The Economy of Feeding

The important question to be considered in feeding a flock of hens is not how much one puts into them but how much they will return per unit of investment. This is especially true this year when feed prices seem to be higher than usual. A good flock will return a profit during this or any other year when properly handled. A poor bunch should never be kept. The statement has often been made when talking cows, and the same holds true with poultry, that there are more good individuals than there are good feeders.

From the scatterng reports that are received from dealers at country points, it would seem that a higher percentage of stock is being sold than normal. Part of this may be due to local conditions and part to the fact that one cannot remember from one year to another how much stuff is handled. If this statement is true, the owner of the right kind of a flock is in a position to clear good money during the year. There are too many people that can only see the increasing feed prices and do not consider the higher price that is now paid for eggs.

There are as many different kinds of hens as there are colors. Some of them will be a total loss and will make enough to pay for the water that they drink. Others will return from three to four dollars for every dollar invested in feed. This is fairly conservative and not an impossible goal to reach. The undersized, mixed flocks of diseased hens in stone or other damp houses, fed on a lot of promises and a little rye, can never do it. Egg production is a manufacturing process of converting raw material into a finished product that can be sold on a good market. Too many flock owners expect hens to work miracles.

Probably the first part of the menu is a scratch feed consisting of a combination of grain feeds. When one thinks of it in that sense it discards the old idea of some oats in the morning and another grain at night.

In many instances, the scratch feed is considered as the part of the ration that the fowl utilized for body maintenance. Although a hen will draw on her body reserve to a certain extent, she will ordinarily consider her own needs first and utilize the excess for egg production. About two-thirds to three-fourths of her total consumption is needed for maintenance.

As a single grain ration there is nothing can replace corn. It stands in a class by itself and should constitute the bulk of the mixture. Wheat is also high in food value but second in the choice of feeds. The addition of this grain to a ration will improve the value when the price is not excessive. Shrunken kernels are classed as feed wheat, lower in price, and desirable.

Because a hen cannot properly utilize crude fibre, both oats and barley are of little consideration when fed as the sole grain. The heavier, plump grain is, of course, worth considerable more than the light grain that is produced in some seasons.

Certain sections, where buckwheat is extensively grown, may be used to good advantage. Rye and some other crops are practically worthless and the hen will show her good judgment by refusing to eat it. Most of the producers would be farther ahead by trading rye for something worth while.

Hens are like most everybody else in that they will do no more work than is required and will get their living for nothing if it is at all possible. That is one reason for the necessity of a rather deep litter on the floor to force exercise.

Often the purpose of the litter is defeated by a flock owner feeding too liberally in the morning. As soon as a fowl's appetite is satisfied she becomes contented, assumes a complacent attitude toward life and refuses to work. Work during the day is what promotes production, avoids the development of vicious habits such as egg eating or feather pulling, and forces the consumption of dry mash.

Setting stated amounts to be fed a flock is flirting with trouble, for conditions are variable. Maturing pullets demand a rather high percentage of grain feed in proportion to the mash. Using artificial light, for the best results, will need an increase in grain feeding. Each of these problems are individual and demand special handling.

Just as a guide, one can state that about four pounds of grain feed to one hundred hens as the morning feed is about right. It is certain and proved that feeding this amount will give better returns than the more common method of throwing in about four gallons.

The night feed should be heavy. This means at least twice as much as was given in the morning and maybe more. A more certain system than watching the pounds at night is to watch the hens. See that the birds have their crops filled at roosting time and that no considerable amount remains in the litter. A small amount remaining can be used as part of the morning feed and will be available when the hens leave the roosts. A night feeding will vary from week to week with changes in temperature, production of the flock, or condition of the hens.

When one speaks of corn in the ration it means either shelled or cracked. The idea of promoting exercise by feeding off the cob may be good in theory but is not so commendable in practice. Working over the litter promotes exercise for the important parts of the body. Pecking away at an elusive, sliding ear of corn may develop the neck or throat muscles of a loud voice speaker or wrestler but it is rather weak on production.

The choice between shelled or cracked corn is a difference in price. When one cracks home grown corn and is equipped to save the meal for the mash, it may be preferable in that more work for the flock is induced by hunting for the smaller pieces.

After production is well started, the feeding of equal proportions of scratch and mash is advised. This condition is often impossible and if one can force the flock to consume one pound of mash to every two pounds of grain, good results are obtainable. Early in the fall with growing pullets or molting hens, a higher proportion of scratch to mash will prevail.

The statement has often been made that in feeding a flock of chickens one should take one pail of feed with one pail of hard, common sense and feed them both at the same time. Watch the flock, note their physical condition, and watch the litter. Overfeeding is just about as disastrous as underfeeding.

We Have Revised and Improved Our

VEST POCKET HERD BOOK

The new editions have more room for records on each page and are generally improved for your convenience. We sold hundreds of these leather bound books last year and feel confident that with the small improvements the book will be even more popular. Book will accommodate herd of one hundred head. Complete with pages for full services, gestation tables, index, etc.

The Son of a Silver Medal Bull For Sale
SNOWFLAKE'S TORMENTOR 234788, born Feb. 24, 1924
A fine fellow, tracing to Gold Medal Bull, Sophie 19th's Tormentor, on both sides. Photos, pedigrees and description on request.
Herd Federal Accredited SHERMAN JERSEY FARM, Dept. B, Charles City, Iowa

Jersey Bull Calves
We are offering at reasonable prices a few bull calves sired by Vive La France's Darling Son and out of cows of rich Sophie's Tormentor breeding. Vive La France's Darling Son is out of Vive La France, the first cow to make over 1000 lbs. fat and the cow whose average of 890 lbs. butterfat for first 6 lactation periods exceeds that of any other dairy cow. He is sired by Darling's Gallant Boy, the silver medal sire and full brother to Darling Jolly Lassie, 1141 lbs. fat as Jr. four-year-old. Two of these bull calves are out of granddaughters of Sophie's Agnes, the first Jersey cow to make 1000 lbs. butterfat.

This Blood Sells Fast!

Our bull calves are either sons of Anton's King Confidence or out of his daughters. They sell so rapidly that only in rare instances are we able to keep them until they are old enough for service. If you want a bull possessing this blood to head your herd, buy a calf six months' old, raise it yourself and save money. A. K. C. has gained a reputation for siring mighty good udders along with the other desirable characteristics. A bull of our breeding will make money for you and improve your herd.

Lessons From My Trip About Denmark

(Continued from page 601)

learn much more from Denmark in all other branches of the dairy industry.

While the whole address by Professor Jensen contained much of great interest, I shall only this time call attention to a few points of special importance for a wholesome milk supply. He stated that it was only since 1910 that we heard anything at all about those—I don't know what to call them—vitamins! Now everybody talks about them, and we see big advertisements about their importance. So it has been found that milk contains more of those vitamins most important for both humans and animal beings, but also that when no green fodder is used, these vitamins disappear, for which reason milk as most generally produced in winter is not as wholesome as when the cows are on grass. Again we are fortunate in America, where silage now is so generally introduced, as this feed provides these vitamins abundantly and thus makes the winter milk more like the grass milk. While hay while green of course provides vitamins just like grass, still they are killed by exposure to air, and thus are lost in the dry hay.

Jonas Nielsen's System

Some call it "Nielsenizing", but it doesn't sound right! And while it really sterilizes the milk, still it must not be called sterilizing, because all the objectionable features of the sterilization of milk are avoided. Now that may sound big, but still it is absolutely true. As I said before, low pasteurization as now practiced is the best method for city milk supply—until something still better may be invented or discovered! Mr. Nielsen's system is not untried, but has been successfully introduced in the Transvaal and is also in use now in Winnipeg. Mr. Nielsen showed me through his splendid machine factory, and also the milk plant in Horsens, where some milk is treated by his system. I shall not now go into details but only state these facts: The milk is heated by a special process, excluding all access of air, to as high a temperature as 135° Centigrade, but for only 60 seconds; is rapidly cooled and bottled or canned, also avoiding all exposure to air, and will keep indefinitely. The most interesting and important advantage is that tests have shown that absolutely all tubercular or other germs are destroyed and—what is equally important—that the milk tastes like fresh milk and also contains all the important vitamins. The only practical objection I thus far can see to this system is that the cream will not rise as perfectly as on low pasteurized milk, but that only about 75 per cent of the cream will come to the top. After all, we have here a most important new progress, and this system undoubtedly will have a great future before it, especially where milk has to be transported long distances. We all ought to be open to convictions, and I await with great interest further developments.

As soon as I know more I shall let your readers know about it.

REGISTERED HOLSTEINS—Famous John M. Kelley Herd

December 9th A Herd of Unquestioned Type and Proven Production, to be Sold at **Baraboo, Wis.**

Three years of phenomenal success on the show circuit. Yearly records up to 828 from 19,000 lbs. of milk on two-year-olds and up to 931 lbs. of butter from 26,885 lbs. of milk.

Unbeatable get of sire class—grand champion two-year-old, remarkable calf herd, exceptional jr. yearling daughters of cows up to 37 lbs. in seven days and 1344 butter in a year, to be sold—as well as a dozen "knockout" bulls including the herd sire, Canary Paul Heilo Aaggie.

A most attractive combination of Homestead breeding has been woven into the herd. Kelley will present the greatest combination of type and yearly production ever offered. On Dec. 9th he is going to take the gamble out of the public sale business.

The herd is absolutely clean and healthy and will be sold on a retest.

TWO BULLS FOR SALE

One from a 29 lb. dam, the other from a 27 lb. 3 year old. Both are by Segis Flint Hengerveld Lad, a 30-lb. son of Flint Hengerveld Lad, he a grandson of Johan Hengerveld Lad. Both bulls priced to sell quickly. The herd is clean.

L. C. KETZLER, R. 8 Flint, Mich.

2 SERVICEABLE BULLS

One from a 23 lb. 3 year old, the other from a 26 lb. cow. Both are sired by a son of King Ona from a 32 lb. 3 year old daughter of King Korndyke Sadie Vale. First check for $150 takes either bull. Herd under Federal supervision.

J. E. BURROUGHS Flint, Mich.

D. D. AITKEN, Flint, Mich.

Breeder of Holstein-Friesian Cattle

MAPLECREST KORNDYKE HENGERVELD—Only Century Sire living—Senior Herd Sire.
FLINT ONA HENGERVELD SEGIS—Junior Herd Sire.

Gladly answer inquiries from people who want to purchase good foundation females by first class sire.

IF YOU OWNED

SERRADELLA KING DORESS you'd be mighty proud to use him. His dam made 28.38 btr. 527.5 milk 7d and in 229d S. O. 305d test has 17,281.4 lbs. milk. She is a full sister in blood to Dora Riverside Colantha with 31.90 btr, 580.9 milk 7d, 122.37 btr 2176.5m at 3½y and 28.91 btr 623.8m 7d 2½y (State milk record when made) 114.81 btr 2438.0 milk 2½y 30d and winner of 91 points in 1923-24 Honor Roll. Born March 11, 1924. Straight as possible to be and well grown. Price 175.00. Send for picture and pedigree.

SERRADELLA FARM, Albert E. Jenkins, Mgr.
A Clean Herd OSCODA, MICH.

Young Bulls

AT FARMERS' PRICES!

I am offering for sale several excellent young bulls at very reasonable prices. They are sired by Ollie Pontiac Segis Piebe, one of the finest individaul sons of Piebe Laura Ollie Homestead King, out of a 1025-lb. daughter of King Segis Pontiac Count. and are out of well bred, good producing dams. These bulls are from a few weeks to twelve months old.

Wabeek Farm Holsteins

Foundation Females For Sale

We are now in a position to offer good foundation females from our herd of over 200 registered Holsteins. We have at the present time a carload of exceptionally good yearling heifers bred for early winter freshening for sale. Part of them are by Sir Ormsby Colantha Bakker, he from Emblagaard Colantha Bakker, 30.79-lb. 3-yr.-old, and the dam of Bell Farm Bakker. The others are by Maplecrest De Kol, a son of Friend Hengerveld De Kol Butter Boy.

We will also price a few good cows. Most of our milking herd have A. R. O. records and all have private herd records.

If you want good Holsteins write us or better still come and select what you want from the herd—under Federal Supervision.

WABEEK FARM, Harry Mather, Mgr.
R. 3, PONTIAC MICHIGAN

SERVICE BULLS

We have only two yearling bulls on hand at the Traverse City State Hospital. Both are well grown and ready for light service now.

Bull No. 527. Born September 15, 1923. Two-thirds white.
Sire: A 34-lb. grandson of May Echo Sylvia.
Dam: A 20-lb. Jr. 2-yr.-old daughter of a 35.5-lb. cow with a 305-day record of 950 lbs. butter and 21,146 lbs. milk. Her dam, a 33-lb. cow.
His seven nearest dams average 32.04 lbs.

Bull No. 535. Born November 9, 1923. Three-fourths white.
Sire: A 36-lb. grandson of May Echo Sylvia.
Dam: A 27.78-lb. daughter of a 30-lb. cow.
His seven nearest dams average 32.78 lbs.

Remember—these are the only service bulls now available from this herd. Send for our list of bulls for sale by Michigan State Herds.

BUREAU OF ANIMAL INDUSTRY, Dept. B, LANSING, MICH.

Detroit Creamery Co. Holsteins

Sir Hengerveld Pietertje Ormsby, Sr. Sire

A grand champion bull whose daughters prove him one of the really good present day sires. He is a double grandson of S. P. O. M. His dam, Chloe Pietertje Ormsby, has 4 yearly records that average 1,048 lbs. butter. We can now offer a few bull calves by him and from 7-day and year record dams.

We Are Offering For Sale

a 6-months-old bull whose dam, a 29-lb. 2-year-old, is now on year test as a 4-year-old with 514 lbs. butter in 4½ months. She is a granddaughter of May Echo Sylvia. His sire is a son of Jemima Johanna Segis, 1,175 lbs. butter as a 4-year-old.

The "Wonder" Cream Separator

Made in two sizes: Six hundred pounds per hour—your finger turns it. *Twelve hundred pounds per hour*—your hand easily turns it.

MARVELOUS DURALUMINUM BLADES, strong as steel, one-third the weight, and absolutely rust-proof. CLEANEST SKIMMERS EVER MADE and at any speed—fast or slow. TURN FAST and greatly increase the capacity.

A jewel—a diamond—among separators—beautiful—hardy—durable—and indestructible.

Read what America's greatest dairy authorities say:

'Tis the Super Separator—

far in advance of all others. See what the world's greatest dairy authorities say. In every instance, these are the dairy professors' own words when they saw the Allsteel at work:

At Wisconsin University—"The finest Separator we have ever run and the greatest improvement in cream separators." Another professor said, "If I had a farm I would prefer an Allsteel to any other."

* * *

At University of Illinois—"The biggest improvement in separators we have ever seen—it is a wonder."

* * *

At Ames (Iowa) University—"A great improvement in cream separator construction."

* * *

At Missouri University—"That is just what the farmers want. The Allsteel will own the separator business in Missouri when people see it and learn all that it does."

* * *

At Arkansas University—"Finest thing in separators—it beats anything I have ever seen."

* * *

At University of Mississippi—"Unbelievable until you see it operate. With price right you can get *all* the separator business."

* * *

At South Carolina University—"Just what the farmer wants. Beats anything I ever saw."

* * *

At Georgia University—"It is the most remarkable separator I have ever seen. When farmers see it they will buy nothing else."

* * *

At North Carolina University—"It is a wonder."

* * *

At Blacksburg (Va.) College—"Your variable feed is the greatest feature of the hand separator today and now with the Allsteel you have the world beaten."

* * *

At Purdue (Ind.) University—"You have a wonderful separator."

* * *

At Lincoln (Neb.) University—"I think it is fine. I can recommend it to anyone who wants a separator."

* * *

At Ohio State University—"A wonderful separator. Could not have believed such work possible if we had not run and tested the Allsteel for ourselves."

* * *

At Cornell (N. Y.) University—"Take it from all angles, it is what the farmer is looking for. If a farmer sees this, he will never buy a disc separator."

* * *

At Michigan University—"It is a wonder. Just what the farmer needs. About fifty years ahead of the others."

* * *

At Amherst (Mass.) College—"The biggest improvement in separators we have had in years. It is an all-purpose separator and has all others skinned a mile."

* * *

At Stoers (Conn.) University—"It is the greatest separator I have ever seen."

* * *

Such strong and direct statements from the leading dairy authorities of the world are absolutely convincing.

SHARPLES Allsteel Separator

Order on coupon below and we will deliver an Allsteel *to your door*, without one dollar of expense to you. If, after thirty days' free trial, you wish to buy it, you may have a whole year in which to pay for it by installments.

You are wondering how we can offer such liberal terms.

A million Sharples Separators have been sold for cash. For over forty years these have led in quality and performance. But never before was a Separator so enthusiastically endorsed by everyone who sees it as the Allsteel has been.

Never before was a Separator so far ahead of all competition. Never before were we so sure that the Separator would sell itself and would need no salesman.

Farmers are honest and trustworthy. We have found them so. Out of thousands of farmers to whom we have shipped Allsteel Separators, on these wide-open terms, not one of them has taken unfair advantage of us.

Fill in and sign the blank. Then mail to us today. Lead pencil will do, but write plainly. The Allsteel Separator will be at your door very soon.

Mail This Coupon

THE SHARPLES SEPARATOR COMPANY
WEST CHESTER, PA.

Branches: San Francisco, Cal. / Chicago / Toronto, Canada

Please deliver to me at your expense a $100 Six Hundred Pound per Hour Sharples Allsteel Cream Separator, for thirty days' free trial at my home.

I assume no obligation, but will try it for thirty days and return it at your expense, if it is not satisfactory in every respect. On its arrival, I will indicate terms I want in case after satisfactory trial, I wish to buy it. If I buy the Allsteel Cream Separator I want a liberal allowance in exchange on my old separator.

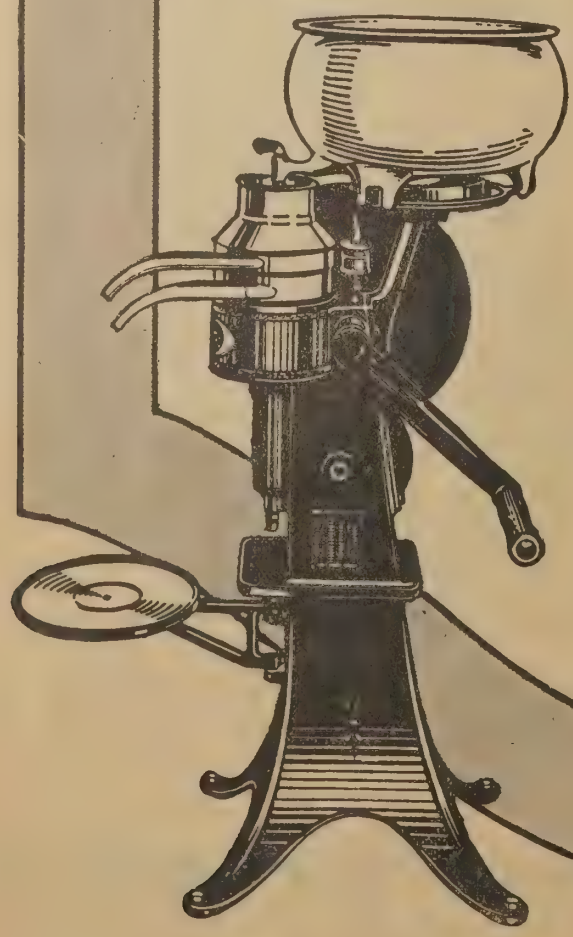
Trade Allowance
on old Cream Separators
for NEW
De Lavals

De Laval Agents are now making liberal allowances for used centrifugal cream separators of any age or make, as partial payment on new De Laval Separators of the latest improved type.



This offers to cream separator users an unusual opportunity to replace obsolete, badly-worn, undersized and otherwise unsatisfactory cream separators that are wasting cream and time and causing trouble and annoyance, with the latest improved and best De Laval Separators that have ever been made. The Improved De Laval Separator is meeting with remarkable success. It skims cleaner and runs easier, and will save its cost over any other method of separating cream from milk.

The De Laval Milker. If you are milking 10 or more cows by hand, you need a De Laval Milker. Sold on such easy terms it pays for itself. Over 25,000 in use, giving wonderful satisfaction.

New De Laval Separators sold on easy terms, ranging from

$6.60 to $14.30 DOWN

the Balance in 15 easy Monthly Payments

What Can Be Accomplished Through Co-operative Marketing

J. F. LARSON, WISCONSIN

IN all the productive industries, with the single exception of that of farming, the selling of the product is considered as much a part of the business as the production. Farmers have never, either individually or collectively, given the same energetic attention to the problem of selling their products as they have to producing them. As population increased and our civilization became more complex, a large number of privately owned marketing agencies were established. These private agencies developed into great complicated systems and farmers lost completely all control of the distribution and sale of their products.

Both in school and at home farmers have studied principles and methods of scientific production. No opportunity to study the principles of marketing was offered for it was not considered a part of the farmer's business. In the course of time many farmers became dissatisfied with results in marketing and some began to assert that marketing is an inseparable part of the business of farming, and, consequently, should be managed by the farmers themselves.

As farmers can not manage a business conducted by agencies owned and controlled by some one else, it clearly means that these privately owned agencies must be displaced by agencies owned by the farmers. Such a doctrine was naturally strenuously opposed by the men who were in control of the marketing agencies. They claimed that the farmer's business was to produce and that there was no justification whatsoever for the farmers to meddle in the business of marketing.

At the start general public sentiment, the press, and other educational influences were almost wholly on the side of the dealers. This sentiment has, however, undergone a marked change in recent years, and now co-operative marketing is advocated by practically all public educational institutions.

Farmers Not Unanimous

One would think that farmers would be unanimous on the question —that they would all take sufficient pride in their business to want to control all phases of it, and, for that reason, all favor marketing their products through their own organizations. Such is not the case and, strange to say, some of the farmers are among the bitterest opponents of co-operative effort. Their natural tendency to suspicion and jealousy and the fear that some of their fellow farmers may secure a little advantage or get into a position of more importance than they, causes many of them to put more trust in a private dealer than they do in the directors of an organization in which each of them can be a governing factor. In fact it seems impossible for some farmers to comprehend that, if they become members, they are the organization. They always think of the co-operative as merely another class of dealers.

Farmer's Lack of Personal Responsibility

Those who like to sneer at the farmers' efforts to get control of the selling end of their own business often speak of farmers being gypped by this or that movement, or this or that organization. If farmers are gypped it is by their own ignorance, for they should not go into an organization that is not truly co-operative and nobody controls a co-operative but themselves.

As the great majority of farmers is yet far from having the right conception of co-operative marketing and do not accept it naturally as a part of their business, they have to be persuaded to support it by being shown the advantages. The claim that it is wrong to urge farmers to co-operate in marketing, that all farmers should be left to their own initiative in the matter and be governed by their own limited knowledge and narrow views, is about as sensible as to urge that it is wrong to teach the value of silos or the advantages of growing alfalfa. To condemn educational propaganda to persuade farmers to co-operate is no more reasonable than it would be to condemn Samuel Adams and Patrick Henry for urging their fellow colonists to support the principles of self-government.

The Real Issue

The real issue now, however, is the greatly differing views as to what can be accomplished by co-operative marketing. As almost every step taken so far has had to be forced by the farmer supporters against indifference, and even opposition of many educational influences, these early workers in the movement have, in a way, been compelled to put the proposition in as strong a light as possible. The first co-operative live stock shipping associations were started in Minnesota and Wisconsin in 1908 by farmer enthusiasts without having the support of either the farm papers or the agricultural economists. In 1921 some of the educational leaders who had by that time become strong supporters of co-operative shipping were unwilling to join with some of the foremost boosters among the farmers in a statement that the next logical step was to unite the live stock shipping association into terminal co-operative selling associations. In that same year, however, the leaders in the shipping associations in Wisconsin and Minnesota took the first step in that direction, and by 1922 such co-operative selling agencies became established institutions in fourteen of the largest live stock markets.

Dangers of Conservatism

Now, since the doctrine of co-operative marketing has become popular and very few have the temerity of coming out in open opposition, there is still a fight between the very optimistic supporters of farmer controlled marketing organizations and those who are very much inclined to conservatism. There is a danger that the very conservative minded, although they are professed supporters of co-operation in marketing farm products, maybe so impressed with the need of counteracting what they consider the mistaken doctrine of some of the honest enthusiasts as well as what doubtless is, sometimes, false doctrine of self-seeking propagandists, that they devote much less effort to showing what can be done than in proving what they think cannot be done. Farmers are sufficiently indifferent and pessimistic on the whole proposition now and when difficulties are multiplied and enlarged and possible advantages minimized, it does not help the movement.

Control of Marketing Not Price Fixing

They do not seem to realize that there is much control of marketing now, though not from the farmer's side. They talk about orderly marketing, forgetting that farmers can do little or nothing toward establishing orderly marketing in their interest without some control of marketing. A doctrine much stressed recently is that prices of farm products are low on account of overproduction and that can not be remedied excepting by prices going so low that a considerable number of farmers will go out of the farming business. Those who proclaim that view seem to fail to see that, according to their own doctrine, prices must stay sufficiently low to keep these farmers out of the business.

President Slocum of the New York Dairymen's League says: "Our

(Continued on page 656)

ATTRACTIVE FARM HOME OF GEORGE ELLIOTT, INDIANA

GRADE HERD OF JERSEY CATTLE ON FARM OF GEORGE ELLIOTT

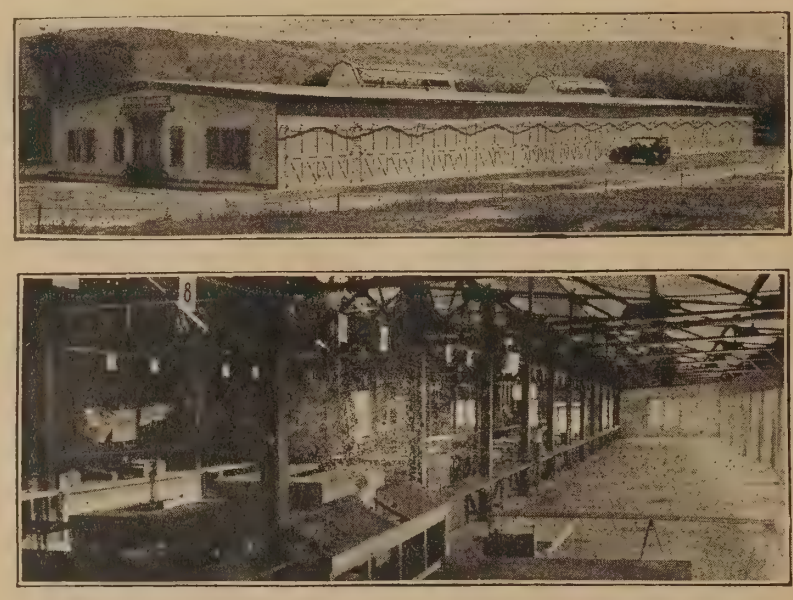
Mr. Elliott has been testing his cows for years. From the first 14 cows he bought only two tested up to his minimum standard and were worth keeping, from the next seven he kept three. He now has a pure-bred bull from a 581-pound cow to head his herd and he keeps about four out of every five heifers from his highest testing cows. He has one grade cow of exceptional merit with a monthly record of 46 pounds milk daily that tested 5% fat. Five of the cows that are now making good in the herd are her daughters, four of them her granddaughters, and two are great granddaughters. One of her heifers tests 7% fat. Mr. Elliott said: "If that one cow had been a pure-bred when I bought her nine years ago she would have easily made me $5,000 instead of $2,000 during the nine years."

Boosting the Income from the Dairy Farm

F. G. MEINT, NEW YORK

THE milk producer sometimes cannot escape from the penalties visited upon other one crop farming systems. Some dairymen of New York State are learning to enjoy the benefits of diversified farming, adopting some new lines.

The counties of the "southern tier" in New York State and of the northern sections of Pennsylvania have a natural center in the rapidly growing city of Binghamton, and its neighboring shoe manufacturing towns of Johnson City and Endicott. Binghamton has a population of about 74,000, and the smaller towns have about 6,000 between them. Business has been and is thriving in these towns because there is a spirit of unusual co-operation between these city residents and the people of the surrounding territories which feed them.



"Community service—a town and country partnership," is their motto, and the form which this co-operation takes is found in the shape of three of the finest public markets in the East.

Formerly this was a food growing section, excepting so far as the production of milk was concerned. There are 320 food stores in the larger city alone, and 110 milk wagons. Too many milk routes, an error that has not yet been eliminated. Cheaper food and fresher food was wanted by the people. They believed that much of it could and should be produced nearby, other than the milk, potatoes, and cabbage of former years.

So in 1917 George F. Johnson, wealthy and philanthropic shoe manufacturer, started a public market for the benefit of his workers. On the opening day there were 1,000 buyers on the market and but 15 loads of food products. Mr. Johnson had his market master give each farmer a new $2 bill to encourage their return, and the promise of every day they would bring a load. This encouraged the farmers to keep coming with what vegetables and other things they had and soon they had extended the list of crops grown to include all that could profitably be grown in the section. They saw its possibilities and there was no need of a bonus to keep up their interest.

About this time Binghamton started a curb market, and its master, John L. Costello, who had for years been a milk inspector for the city and knew the dairymen by their first names, began to ask, "Why do you wait for your money a month and a half all the time? You could just as well get some extra money right in your fist every week if you'd grow some stuff for the market."

Last month there were 933 farmers on this market alone, and 325 on the Johnson City and the Endicott markets. The two latter did a business of about $95,000 in August and of $82,000 in September. Binghamton does considerably more than both of the smaller ones. Had it not been for these markets very little of this cash would ever have come into the hands of these farmers.

EXTERIOR AND INTERIOR OF PUBLIC MARKET AT BINGHAMTON, N. Y.

Mr. Johnson has recently presented each town with fine, new, closed market buildings with large sites so that any overflow that may occur in a generation or so may be taken care of. The buildings are of steel construction with cement floors and are not so expensive but that any city could and should have one.

Everything that can be grown on an eastern farm is sold on these markets on three days each week from 9 a. m. until noon. Dealers are not permitted to enter the market to sell anything that a farmer can grow in this section, thus shutting off destructive competition. All sales must be retail sales until 10 a. m. After that farmers may sell to dealers if they like and on their own terms, providing they keep within the maximum market prices that are posted on the bulletin board for the day. These prices are advertised in the papers of the day preceding each sale. Producers may sell as much under these prices as they like but not over. The prices that usually prevail are about half way between the retail and wholesale markets of the section.

No farmer is charged anything for the privilege of coming into the market. Neither is there any charge to consumers. The City Board of Health and Public Safety furnishes three (meat, milk, and sanitary) inspectors and a caretaker for the market. The business grows each month, both in interest shown by both growers and consumers and in actual receipts, demonstrating that the principles governing the markets are sound.

The farmers are most enthusiastic as it gives them a fair cash return for labor. For instance, last October the writer saw producers drive in from 40 to 50 miles away with loads of potatoes for which they received $1 a bushel, and cabbage which they sold for 4 cents a head. At the local shipping points in the district potatoes were selling as low as 40 cents a bushel and cabbage $6 a ton.

The farmers' wives especially appreciate this opportunity to realize a little cash for their efforts and the quantities of pies, cakes, cookies, bread, doughnuts, jams, jellies, marmalades, flowers, potted plants, bulbs, berries, and hand-made articles changing hands at attractive but reasonable prices, were huge.

The feeling between producers and consumers is a fine one. The market masters, J. L. Costello, of the Binghamton market, John Patterson of the Johnson City market, and Mr. Goodenough of the Endicott market are extraordinarily popular and efficient.

Dr. Ruby Green Smith of the New York State College recently pronounced these markets the finest she has ever seen excepting Seattle's and she has had experience in helping to organize 43 markets in various cities of the country. She believes that in all cases where a market of this sort is to be attempted that a careful survey should be taken of those who would be willing to grow food and of those who would be willing to buy food. Given right conditions she commends the public market as a very essential and highly valuable solution of the too low income on the farm and the too high cost of living in the city.

Efficiency Imperative When Feeds Are High in Price

Address By F. B. Morrison Before Wisconsin Dairymen's Association

WHEN concentrates are high in price and milk tends to be relatively low, farmers are naturally eager to cut down their cost of production in any way possible. Therefore many are now debating as to how they can feed their cows so as to cut down their cost of milk production this winter. Some are attempting to do this by feeding but little grain or other concentrates, and letting the cows fill up on all the roughage they will eat. Will this cut down the cost of milk production or not?

This fall and winter is surely no time to waste concentrates. All will agree to that. However, dairymen must be careful not to be "penny wise" and "pound foolish".

We must remember that a good dairy cow when well fed needs about half her feed to maintain her body. If the amount of feed for a good dairy cow is seriously reduced in an attempt to cut down the cost of milk production, the effect will be just opposite to what is desired. As is shown in the figure, if a good cow is fed a three-fourths ration, she still needs just as much feed as ever to maintain her body and can use only one-third of what she eats to make milk.

Filling a cow up on roughage, even good roughage, and giving her little or no grain or other concentrates has just this effect. She gets plenty of *pounds of feed*, but each pound of roughage supplies much less *digestible nutrients*, or real food value, than a pound of concentrates. Hence, the cow gets full before she can secure enough nutrients to produce a good flow of milk. If a cow is of beefy tendency, it is easy to overfeed her.

Farmers who have efficient cows in fair flesh which are producing a good flow of milk sometimes are deluded when they cut down on the amount of concentrates they are feeding. The cows seem to give nearly as much milk on the reduced allowance as they did before, and the farmer feels that he is saving considerable money. It is true that a good dairy cow fed insufficiently will continue for some time to try and give a good flow of milk, for her maternal instinct forces her to do this. However, she can do this only by drawing on her body and running down in flesh. Soon her production will be seriously reduced.

Under conditions like the present it would seem best for Wisconsin farmers to continue to feed their *good* cows a fair, but not excessive, amount of concentrates, so as to maintain a good production. With ordinary kinds of roughage we advise adhering quite closely to the usual thumb rules of feeding concentrates with all the choice alfalfa or clover hay and corn silage the cows will eat twice a day. It may be most economical to reduce the amount of grain or other concentrates about one pound below the amount required by the thumb rules.

Even under normal conditions poor dairy cows are "boarders". Now they are serious liabilities. They had better be sold for whatever can be secured for them instead of feeding them at a loss all winter.

Our advice to farmers is therefore: (1) Cull your herd and get rid of the boarders; (2) feed your efficient cows good rations; (3) do a little figuring and try and feed as economical a ration as possible. In case of doubt as to what feeds to use, call on your county agent or the college of agriculture for advice, stating specifically what feeds you have, the local prices for purchased feeds, the kind of cows you have, and their average production. All these facts are needed to give intelligent advice.

Concentrate Mixtures for Winter of 1924-25

To feed with plenty of clover hay and corn silage or roots: (1) Ground barley or rye, 300 lbs.; ground oats, 300 lbs.; wheat bran, 300 lbs.; linseed meal, 100 lbs. (2) Ground corn, 300 lbs.; ground oats, 300 lbs.; wheat bran, 275 lbs.; linseed meal, 125 lbs.

To feed with plenty of alfalfa or soy bean hay and corn silage or roots: (1) Ground corn, 500 lbs.; ground oats, 500 lbs. (2) Ground barley or rye, 500 lbs.; ground oats, 500 lbs. (3) Ground corn, 600 lbs.; wheat bran, 400 lbs.

To feed with timothy hay and corn silage or roots: (1) Ground barley or rye, 250 lbs.; ground oats, 250 lbs.; wheat bran, 200 lbs.; linseed meal, 300 lbs. (2) Ground corn, 200 lbs.; ground oats, 200 lbs.; wheat bran, 300 lbs.; linseed meal, 300 lbs.

To feed with mixed hay (if half clover and half timothy) and corn silage or roots: (1) Ground barley or rye, 275 lbs.; ground oats, 275 lbs.; wheat bran, 250 lbs.; linseed meal, 200 lbs. (2) Ground corn, 250 lbs.; ground oats, 250 lbs.; wheat bran, 285 lbs.; linseed meal, 215 lbs.

A Good Alfalfa Tour

ONE of the best ways of telling the story of alfalfa to farmers is to get them to climb over the fence and get their shoes mixed up with what the other fellow is doing. Telling the story of alfalfa so it will stick and eventually swell the bank account of the audience is the important thing, though sometimes met with difficulties. One important thing is for the salesman to make contact with his prospect. Alfalfa will sell itself if once a good contact is made.

On July 17 and 18, 1924, Harry Warner and F. G. Churchill of the soils and farm crops agricultural extension service, came down to Jackson County, Iowa, to tour with farmers who could be induced to take a day off. One small community tour was made on July 17 and one more extended tour was made on July 18. A program of considerable variety had been previously arranged and announced. Four county agents from nearby counties and some 150 farmers, most of whom were local, made up a very enthusiastic audience.

One of the lessons learned from the Glew farm was that of converting a somewhat rock strewn and heretofore useless hog lot of 5 acres into a ..eful and successful alfalfa producer.

On the Kier farm, the Michigan home-made lime spreader was demonstrated and following this was the use of a spring tooth harrow for cultivating alfalfa. The men were also shown the difference in stand caused by the use of northwestern grown seed of known origin and seed of unknown origin. They were also shown the effect of late and close to the ground cutting.

After leaving the Kier farm the tour took the men over into Clinton County to the Coverdale farm where, perhaps, the best field of sweet clover pasture that any of the men had ever seen, was shown. Certainly, after this none of the men would ever again lend a sympathetic ear to the one who says that sweet clover does not make good pasture and that cattle will not eat it.

FROM BARREN HOG LOT TO FINE ALFALFA
Owner and tenant talk it over on the H. M. Glew Farm, Iowa

A LIMESTONE PULVERIZER IN ACTION ON THE DAY OF THE TOUR

In the afternoon, while stopping first at the Beaton Bros. farm, some one asked one of the boys what an acre of their 5-year-old field of Grimm was worth.

"It depends on the market for cattle," said Mr. Beaton thoughtfully, but added, "it will make market toppers any time."

Jack Martin took great delight in calling the attention of the crowd to the fact that his barns were already full and they were stacking out of doors and it was only the middle of July.

At Hurstville the men and women were very much interested in the A. A. Hurst pulverizer. While there, Will Hurst started the machine. Perhaps 20 farmers crowded each other to get the "feel" of the newly pulverized limestone. Mr. Hurst's farm also exhibited a very fine 14-acre field of alfalfa.

The last stop was made at the Clyde Hamilton farm. Two loads of lime rock pulled in to the field where a pulverizer stood ready, just as the first car of the 28 arrived. As usually happens, a few cars got off the road going over but by the time every one was there, Fred Gisel, owner of the pulverizer, was shoveling away the fine uniform pulverized product. The machine worked perfectly and no one left until the last rock had been reduced to powder.

The program was concluded with a trip to another part of Mr. Hamilton's farm where applications of lime, lime and phosphorus, phosphorus and no treatment on oats and clover seeding had been made. The comparisons were very noticeably in favor of the two plots receiving phosphorus.

Mr. Warner and Mr. Churchill said, "We are satisfied with the program and the results."

The crowd said, "There should have been 500 farmers with us today instead of 150, but otherwise we are satisfied."

National Milk Producers Meet

IN our issue of November 21 we published excerpts from several addresses delivered at the annual meeting of the National Milk Producers' Federation and this week we publish several more. We are indebted to C. W. Holman, secretary of the organization, for liberal extracts of the several papers presented.

Dairy leaders, representing 300,000 organized farmers, heard John D. Miller, president of the National Co-operative Milk Producers' Federation, denounce the open and disguised enemies of co-operative marketing and point out the pitfalls that come from too much dependence on legislative enactment, at the opening of the eighth annual convention of the federation held at Detroit, Mich., November 14—15.

Judge Miller in opening the convention said that the 28 member associations are self-help organizations; that they are the result of years of effort and sacrifice, and that they are here to stay. He warned members to beware of the change of tactics used by opponents of co-operative marketing, saying that powerful opposition formerly fighting in the open now gives a loudly professed approval of co-operative marketing and at the same time always tries to have a voice in the control of the organization.

Perhaps one of the most important points made by Mr. Miller was when he called attention to the fact that most of our agricultural ills are economic rather than statutory, and as such must be approached from the economic standpoint. He indicated that we never will get anywhere as long as we try to solve our problems by legislation.

If commodities are bought and sold some one must name a price. All that the farmer asks for is to have an influential voice in determining what price dictated by the law of supply and demand. The law of supply and demand must be applied at the right time and the right place.

⚜

"I will never be satisfied until New York City people consume an average of a quart of milk a day," said Royal S. Copeland, former health commissioner of the city of New York, at the close of the federation program.

While Mr. Copeland was health commissioner the consumption of milk in New York City was increased from 1,800,000 quarts to 3,000,000 quarts per day. While this was a good thing for dairymen it was also a good thing for the health of the people of the city.

Mr. Copeland's estimate of the value of milk to the human family can best be stated in his own words as follows: "The standard of civilization, as I view it, is fixed by the degree of consumption of fluid milk."

Because of the fact that so many of our people now live in the great cities and because milk affords such a splendid place for germs to thrive unless properly cared for, the distribution of milk has become a huge problem. As evidence that the dairyman is trying to do his part in producing the best milk possible, Mr. Copeland said that while the New York City regulations permitted the selling of milk for average purposes which contains not to exceed 100,000 bacteria per cubic centimeter, large quantities of milk are being brought to the city for sale which contain under 500 bacteria per cubic centimeter. There is hardly a water supply bragged about for its purity where the bacterial count is not in excess of this.

It has taken some time to bring about understanding between the producers and the Health Commission. Producers are coming to realize that the regulations are not imposed simply to be disagreeable but for the best interests of all concerned.

⚜

Harry Hartke, vice-president of the Pure Milk Association of Cincinnati, told of the strenuous fight producers have had to make to gain control of the fluid milk distribution of that city. Arrogance and hostility on the part of the dealers forced producers into the retail market.

The Co-operative Pure Milk Association as a bargaining association was never able to secure satisfactory co-operation from milk dealers. The dealers tried to discredit co-operative marketing by raising and using a large slush fund.

Two things in connection with the preparation for entering the retail market stand out as important. The committee made a thorough study of many co-operative associations and interviewed eminent students of co-operative marketing before a plan was drawn and presented. In presenting this plan to producers those in charge did not try to over-sell it.

After just passing through a strenuous six months of price war the membership is larger and the morale is excellent.

In order to discredit the association and co-operative marketing, the dealers have paid non-pooling farmers 45 cents per hundred more than they could afford to pay and more than the co-operative did pay during that period, but in spite of this the membership has stood solid.

In closing his talk, Mr. Hartke said: "We now have over 50 per cent of the fluid milk and over 70 per cent of the ice cream business in Cincinnati and surrounding territory. A very bitter feeling has been engendered by unscrupulous opposition but eventually the respectable dealers will be buying our product."

⚜

R. W. Strong, secretary of the Ohio Farmers' Co-operative Milk Association, in order to get clearly before the convention the fight that his association has made, went back to 1915 when the board of directors of the old Ohio Farmers' Co-operative Milk Company was arrested in the dead of night and locked up in the Cuyuhoga County jail without bail, being charged with violating the State Anti-trust Act. In the sensational trial that followed these men were found not guilty. The present association is a reorganization of the old company.

Immediately after reorganization the association had difficulty because of the Freeman—Collister bill passed by the Ohio legislature which placed the trucks under the Utilities Commission granting them a franchise over the route. Immediately the association truck men became indepen-

Aberdeen Centralized Creamery

H. J. BOYTS, SOUTH DAKOTA

THE profits made by the farmers in delivering their cream to a co-operative plant at Aberdeen, South Dakota, have built the best equipped creamery in the state and undoubtedly one of the very best in the whole dairy region, besides leaving a nice surplus.

The Equity Union Creamery, a co-operative centralized plant at Aberdeen, cost $175,000 when it was built in 1920. More than 4,000 farmers have benefited by pooling their cream and milk in this plant, which is now doing a million dollars worth of business a year.

This plant is the first Co-operative Centralized Creamery to be established in this country and it is a proven success. It reaches out a hundred miles in all directions from Aberdeen to get cream from its members. It is true that some members are too far from the creamery and that it makes it necessary to churn two grades of butter. However, as the dairy industry grows in northern South Dakota, other plants can be built. This, with the greatly improved transportation facilities, will make it possible to furnish the best product at all times for the markets. The foundation is laid for centralized selling for the farmers of northern South Dakota. The first 10 years have seen not only a good plant constructed, but a stronger and better market has been established. In fact, the local station price has been improved from five to six cents per pound for butterfat.

The slogan adopted by the Equity Union Creamery is accurate weights, correct tests, and prompt service. The response from the farmers leads one to think that the motto is put into practice. The product has made a reputation on the Chicago market.

Ice cream and egg departments have been added, recently, which is going to give the plant a big opportunity for growth and service to its members. A total of 11,525,000 lbs. of butter has been sold by the company, or about a car and a half per week.

The Equity Union Creamery found its birth in the fertile minds of a few men at a small meeting at Mott, North Dakota, in 1914. On July 29, 1914, a special creamery meeting was held in Aberdeen, when a set of by-laws was formulated and adopted. The organization was chartered the next year and on February 16, 1916, the first churning of butter was made in the original plant. This co-operative, like a great many, had a hard struggle to get under way, but with persistent effort of the men who had the vision of co-operation, the venture has made good. How well the first directors had planned is shown by the fact that

EQUITY UNION CREAMERY, ABERDEEN, SOUTH DAKOTA

they have almost unanimously been chosen every year since to conduct the business affairs of the institution.

One-half million pounds of butter were made the first year. By the latter part of 1917 the business had outgrown the original building, only built 18 months previous. An addition to the first building was then built, which was larger than the original building. It was needed for the volume of business doubled. The Equity brand had become known and the farmers continued to join.

In a little over two years later, business had grown to such an extent that the directors laid plans for the new plant. F. M. Norum, the present manager, was in charge at that time, and the achievement of constructing the fine, fully equipped plant was under his direction. Again the judgment of the leaders in this plant was justified, for the business has almost doubled again. Upwards of 2,000,000 pounds of butter will be churned this year, and there is every reason to believe that this company will continue to grow.

A centralized plant of this nature has these advantages to offer the average farmer:

1. Direct voice in its operations.
2. Can standardize the products of a large community and develop a definite brand.
3. Large volume with efficient management lowers the costs of distribution.
4. Opportunity for price improvement is afforded.
5. Chance to advertise products, as a large volume cuts the cost per farm to a very small amount.

Ma Goes To The Dairy Show

ELSA L. CLARK, OHIO

THIS year I decided to attend the Dairy Show with Pa. He was going to drive through in the flivver, so I brushed up my last year's hat and year-before-last dress and other things I thought I would need and off we went. It happened that I guessed wrong and left things I neded most and took things I didn't need at all.

Well, we got a good early start. After riding a ways it was perfectly evident to me that no tourist need ever starve to death. About every half mile some farmer had a stand where one could buy anything from a "hot-dog" to an onion. We passed through a town that had some wonderful hat bargains in a window. I asked Pa if he wouldn't stop a minute, but he said, "I should say not; we haven't got the time."

I knew I'd never see bargains like that again, but on we had to go. Well, out of town a little way Pa suddenly slaps his knee and says, "By golly, it's only about three miles off the highway where Pete Jones has that high record cow".

"Oh, but we haven't time to go to see her," I says, but he couldn't hear me.

So we went the three miles out of our way and he went to the barn to look at beautiful Polyaggie, or whatever her name was. Pa and Pete talked and then he called for me to come and see her, too. I had on new shoes and the path was all mud, so of course I was glad to go. After getting all mud we went up to his house. His wife was canning about three things at once and I thought that her smile was a trifle forced. Pete started asking us if we couldn't stay for dinner.

"Oh yes, do," she says.

Now Pa is one of these innocent creatures and he was just starting to accept but I had seen the look she gave Pete and hastily declined. Why that look said just as plain as day, "You simpleton, here I am in the middle of canning, and there isn't a thing in the house to eat".

So we went on and ate at a place along the road. It was the kind of a place where the man welcomed us in and took our order. Then the wife fixed it and waited on us while the man read the paper. When we had finished the man took our money—and still they call us the weaker sex!

The rest of the day I continued ruining my eyes watching for road signs, policemen, and licenses. If I didn't see what state each passing automobile came from, Pa felt hurt. We counted twenty-five different states and then I rebelled—who wants to spend the day looking at automobile licenses! We passed a wagon load of chickens crated for market.

"My," I says, "that'll bring enough money to buy that man's wife a fur coat."

"Yes," says pa, "it would, but it won't."

My nerves got a trifle on edge by that night. Pa is one of these men that smokes a pipe while he drives, and when he talks he not only leaves it in his mouth but talks straight ahead to the windshield. Then, when I can't hear what he says he accuses me of being deaf. However, I felt better in the morning after a real country breakfast at a farmhouse. It consisted of cold storage eggs, weak coffee, and ready to serve breakfast food.

It was raining when we went through the next place which was a college town. None of the college boys were wearing hats or caps. Pa said he guessed that they had so much grease on their hair that it just shed the water. The country schools we passed didn't look much like the kind I used to attend. They were large, new, and well kept. Nearly every one had an automobile beside it that "Teacher" came in and many of the children roller skated to school along the concrete road.

We stayed that night at one of Pa's uncles. As we were finishing supper he asked us to please place our toothpicks inside our napkins so that we wouldn't need clean ones for breakfast. We listened to his radio that night but Pa didn't like it because the announcer kept waking him up.

We finally got to Milwaukee where the Dairy Show was held. They have little humps in the street that you're supposed to drive around. Pa drove on the wrong side of one of these and up comes a policeman right away. Now a policeman is the one person under the sun that Pa doesn't argue with. So we listened to what he had to say (which was a lot) and rode on. About two blocks farther they had some new automatic signals, the likes of which we had never seen before. They were on the side of the street instead of in the middle, so Pa drove calmly past and up came another policeman. By that time Pa had decided that this was no place for him, but at last we reached the grounds where the show was to be.

The first building we went through was full of booths where they gave away samples of dairy products. I ate so many samples that I felt as if I couldn't look a cow in the face again.

"This is fine," said Pa, "we won't have to buy any supper. I've had milk, condensed milk, cottage cheese, Swiss cheese, Brick cheese, and goodness only knows what else."

"I'd like some ice cream though," says I. So we went to a place where it was being sold. Pa reads aloud all of the menu of Honeymoon Specials, Lover's Dreams, Sweetheart's Delights, Fudge Loves, Fruit Smash, and lots of others, and then says, "I'll take vanilla ice cream".

The exhibits were fine. I learned a lot of new recipes, got a lot of free literature, and saw a lot of things I'd like to have.

The second day Pa went to the show and I walked through some of the stores. There was a little picture in one window that I liked pretty well, so I asked the clerk how much it was. "Seventy-five," says she kinda languid like, patting her boyish bob.

"All right," says I, "I'll take it."

I gave her a dollar bill and she looks at me sort of pityingly and says, "That picture is seventy-five dollahs".

"Oh," says I and sort of melted out of the store. After looking at several things I decided that the ten-cent store was a good place to do my shopping.

Pa came back in a fine humor. For once he and the judge had agreed on cattle judging. So he took me to a theatre. I was tired but I knew that if the judge didn't pick Pa's choice for grand champion next day that there'd be no invitation for me then, so I said that I would like to go.

The next day we both went out to the show. I learned a lot of things: What the cow population of each state was, how to make a cow sell herself, what feeds make dairying a gold mine, why some folks milk cows for exercise only, and, as Jake Thompson, our auctioneer says, other things too numerous to mention. Some of the lady demonstrators had all their foods cut up into fancy shapes. I could just see myself on wash day or in threshing time cutting up bread, peppers, cheese, etc., into little circles and triangles—but anyway they looked nice. I listened to "cow talk" all the rest of the day and rediscovered that dairymen are men with only one topic of conversation.

We started for home that night and I thought I'd had a good enough time to want to go to the Dairy Show next year.

Sociable Sybil—Peerless Dairy Cow

F. W. DOHERTY, NEW YORK

FOLLOWING one of the most spectacular show ring careers in dairy history, Sociable Sybil 478362 has completed an official test which singles her out as a master product of the breeders' art—the perfect dairy animal, faultless in form and remarkable for production.

Even before this test was started, over a year ago, it was felt that the Babcock test and the milk scales would fulfill the rich promise of great production that has always been an outstanding character of this superb cow, and the final figures of the test show that the great expectations based on dairy type have been more than justified by her peformance at the pail.

Sybil was 4 years and 11 months of age when she was started on this test and in the following 365 days she produced 855.16 lbs. of butterfat and 15,334 lbs. of milk. Her milk averaged 5.58 per cent fat for this period.

The record of the test also shows production maintained at a high rate to the last day of the year. In every month more than 60 lbs. of fat were recorded, while for six months production exceeded 70 lbs. per month. The highest month showed 81.55 lbs. of fat produced.

SOCIABLE SYBIL—PERLESS DAIRY COW

Beginning at 4 years and 11 months Sociable Sybil produced in the following 365 days 15,334 pounds milk containing 855.16 pounds fat. The butterfat percentage averaged 5.58 for the test period.

The best part of the story remains to be told, however, for Sybil is believed to be safely in calf and is expected to meet the calving requirements in Class AA, in which case she will qualify for a Medal of Merit—the highest medal award offered by the American Jersey Cattle Club. If she wins this coveted medal it will be a most useful addition to the long list of honors that she has already won in the show ring. But in any case she is the highest testing National Grand Champion cow of the breed.

Most breeders will remember, I think, that Sociable Sybil has won no less than seventeen grand championships, including that of the National Dairy Show of 1923. This year she was shown at the Eastern States Exposition, just after her year's test was completed. She was still milking forty pounds, and although she had been in her working clothes for better than a year she had no serious competition in the Register of Merit class, and was awarded first prize.

A word about Sybil's history may be interesting at this point. She was bred on the Island of Jersey and was imported by W. R. Spann & Sons early in 1920. Her sire is the $65,000 bull, Sybil's Gamboge 174663. This remarkable animal is a silver medal winner, and he already has 34 daughters and 6 sons in the Register of Merit. He is a son of Imp. Gamboge Royal Majesty 149864, and a grandson of Imported Oxford Majesty 134090.

Sociable Sybil is a daughter of Eminent's Jersey Skater 534140, a cow that was sired by Imp. Combination's Premier 150715. This outstanding bull was purchased last summer by a Texas breeder for $13,500.

In June, 1920, Sybil was offered at auction in a lot of three heifers at the Spann sale and was purchased by L. O. Stevenson for Ogden Mills, owner of Inderkill Farms, New York, for $2,200. It is interesting to note here that she was the last heifer left in the ring. Since that time she has had a remarkable career in the show ring, and has come to be regarded by many as the greatest living cow of the breed.

It is not hard to imagine the satisfaction that Sociable Sybil has brought to those connected with Inderkill Farms by her splendid achievement while subject to the rigid official test, but Sybil is such a well known figure in the Jersey and dairy world that her latest triumph will be a source of gratification to everyone connected with the breed in any way.

Yeast For Calves

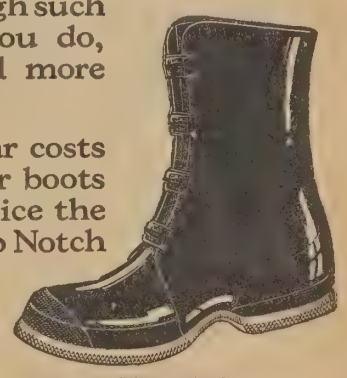
Under the direction of Dr. C. H. Eckles of the Dairy Department of the Minnesota College of Agriculture, an experiment was carried on with calves to determine the supplementary feeding value of yeast. Several groups of calves were used to determine whether yeast would produce faster growth, develop stronger calves, and otherwise be advantageous to use. The conclusions drawn from the experiment are as follows:

1. The addition of vitamin B in the form of dried yeast to the rations ordinarily fed on dairy farms did not increase the rate of growth of calves from the age of 20 to 180 days.

2. No definite effect was observed on the health of calves as a result of supplementing their rations with dried yeast.

TOP Notch Redfore, a long-wearing, cloth-top gaiter of superior quality that will be sure to give satisfaction.

Tested for wear and comfort



UNDER wearing conditions that are far more severe than ordinary use, Top Notch Rubber Footwear is thoroughly tested out. In snow and slush, in snags and rocks, these test pairs must make good. They have got to prove that they will give long service.

After these test pairs have proved satisfactory every other pair is built up, by hand, with the same painstaking care, using the same superior grade of materials.

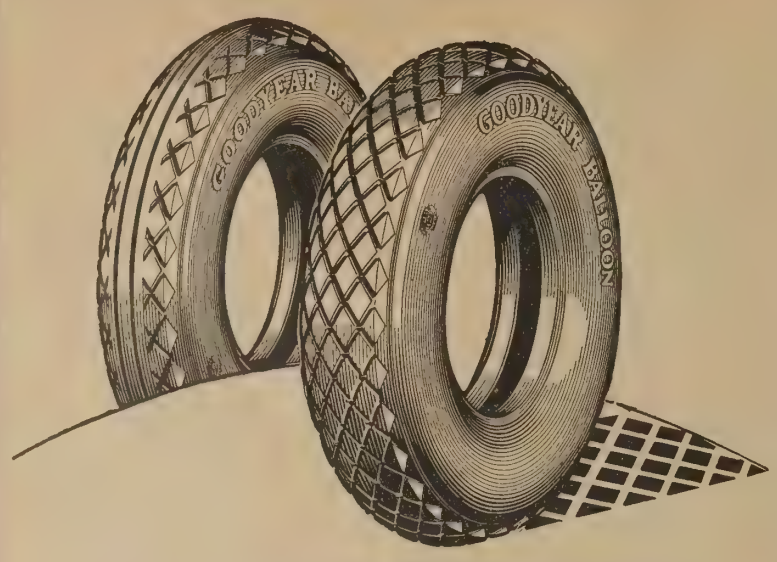
It is not likely that you will ever put your Top Notch Rubber Footwear through such severe punishment, but if you do, you can be sure that it will more than make good.

Top Notch Rubber Footwear costs no more than ordinary rubber boots or shoes. It will often give twice the service. Every pair has the Top Notch standard of mileage. They are made in all styles and all sizes—for men, women and children—boots, arctics and heavy and light rubbers.

The best stores carry Top Notch Rubber Footwear or will be glad to get it at your request.

CORNBELT

THE shoe illustrated herewith is the Top Notch four-buckle Cornbelt, an all-rubber arctic that is especially built to give long wear. Cornbelts are made in all sizes for men, boys and youths; as well as a similar article called "Snoshu"—an all-rubber gaiter for women, misses and children.



BEACON FALLS RUBBER SHOE COMPANY

Use Dried Beet Pulp Instead of hay or corn silage

Don't let shortage of hay or corn silage worry you. Experiment stations and wide investigation have found a wonderful substitute.

In tests, 6 pounds of dried beet pulp have replaced 10 pounds of mixed hay. It costs no more and increases milk yield 2 to 5 pounds a day. In other tests, 1 pound of Dried Beet Pulp replaced 5 pounds of corn silage. It produced 10% more milk and improved health of cows.

Feed Dried Beet Pulp. It is the sugar beet, dried, after the extraction of the sugar. It is a succulent, palatable, nutritious and wholesome feed and means bigger profits.

Color Your Butter

"Dandelion Butter Color" Gives That Golden June Shade which Brings Top Prices

Before churning add one-half teaspoonful to each gallon of cream and out of your churn comes butter of Golden June shade. "Dandelion Butter Color" is purely vegetable, harmless and meets all State and National food laws. Used for 50 years by all large creameries. Doesn't color buttermilk. Absolutely tasteless. Large bottles cost only 35 cents at drug or grocery stores. Write for free sample bottle. Wells & Richardson Co., Burlington, Vt.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Better Milk Bigger Profits

Keep your milk sweet and wholesome by cooling and aerating it with the "Chilly King" Prevent losses from souring and returned shipments

Chilly King
Cooler and Aerator

Cools milk perfectly—without ice—and secures its thorough aeration. Simply built. Easy to clean—no filth-catching corners. Milk flows in a thin film-like sheet over V-shaped Spiral Rings. Practically 100 per cent efficient. Sizes for all-sized herds. Write for catalog.

Some Washington Holstein Records

TO win high honors for butterfat production among 30,634 cows in 45 cow testing associations in nine western states, even though for only one month, is an achievement worth recording. During the month of July two cows from the Washington State Holstein herd at the Western State Hospital won the above distinction because of their performance at the pail.

The highest honor went to Donnybrook Cornucopia Clothilde that produced 3,146 lbs. milk and 116.5 lbs. fat for the month. She has an official record of 766 lbs. fat in 305 days which at that time made her the champion butter cow for the state. This honor has since been won by another cow of this herd, Florence Pontiac of Greenbank, who produced 779.08 lbs. fat in 305 days.

The second highest producing cow among these thirty thousand and more western cows is Edith De Kol Model that produced 2,275 lbs. of milk and 104.6 lbs. fat during July.

The Western State Hospital herd also ranked second for best herd average of butterfat in herds of over 15 cows, the average being 54.7 lbs. fat on a herd of 70 cows.

The new Washington state champion butter cow, Florence Pontiac of Greenbank, with 24,047.7 lbs. of milk and 779.08 lbs. fat in 305 days, replaces Hollywood Lilith Piebe De Kol, owned by Thomas J. Owens, and whose record was 22,258.7 lbs. milk and 772 lbs. fat in 305 days.

Another cow of the Western State Hospital herd, Steilacoom Fayne Cascade, has a rather remarkable record when considering the fact that her total production came from the two rear udder quarters. For some reason the fore quarters never developed, at least to active milk production. She has just made a 365-day record of 26,789.9 lbs. milk and 819.03 lbs. butterfat at four years of age. She is a daughter of Sir Fayne De Kol Inka and out of Cascade Jeannie who has a 7-day record of 22.68 lbs. fat at four years of age.

THIS IS STEILACOOM FAYNE CASCADE, WHO PRODUCED 26,789.9 LBS. OF MILK AND 819.03 LBS. OF BUTTERFAT IN 365 DAYS AND ALL FROM THE REAR HALF OF HER UDDER

She is owned by the State of Washington and is a part of the Western State Hospital Herd.

FLORENCE PONTIAC OF GREENBANK, WASHINGTON'S NEW CHAMPION BUTTER COW

She produced 24,047.7 pounds of milk and 779.08 pounds fat in 305 days in the Western State Hospital Herd, Washington.

County Milk Conference Committee

HOARD'S DAIRYMAN:—Following an adjournment through the several summer months, the first monthly fall meeting of the Montgomery County, New York, Milk Conference Committee, was held on October 29. It afforded an interesting and profitable program for about 125 dairymen who assembled from all parts of the county. The meeting was called to order by John Ingersoll, who briefly outlined the original purpose of why the committee was chosen. Mr. Ingersoll pointed out the apparent need of all dairymen gaining a clearer conception of the marketing problem, which would better prepare for greater harmony among producers and ultimately stimulate a greater directing force for constructive action in marketing fluid milk.

Frank Bauder, member of the Committee of Fifteen and who has attended regularly the meetings of this body, gave a comprehensive report of the work of the committee. He stated that the Committee of Fifteen was striving for closer harmony between the several groups and to

unify dairy interests in New York State. Considerable stress was placed upon the business side of approaching the problem with greater unison between the groups and that time must necessarily be allowed for attaining results. To encourage the production of a full and regular supply of milk for the markets available to producers in the terrtory, to encourage the consumption of milk more generally, and to stabilize the dairy industry to the fullest degree for the farmers in the territory, were the main features of Mr. Bauder's report. He also pointed out that a solution of the problem was not up to a few of the dairymen in every section, but rather to every dairyman throughout the state. Concerted action is needed, not of the sensational type but along sound, farseeing lines.

C. E. Sniffen, statistician and market reporter for the Dairymen's League Co-operative, was next introduced by the chairman. By the use of charts Mr. Sniffen presented graphically some of the many intricate phases of the milk marketing problem in New York City. He stated that so far as New York City affords a market, all milk of classes number one and two, also cream, rightly belong to the producers in this territory, and that outside milk should never be received except in case of an actual shortage. Because milk is perishable and not readily transported over long distances, the present range of shipping distances is very apt to prevail.

The speaker next pointed out the two typical groups of venders of milk who largely control the milk after it leaves the producers. One group is the retailer who engages his milk very largely direct from the producers. Here little competition exists. The retail consumption is a very uniform factor throughout the year and the price to the consumer is very stable, without great fluctuation.

The peddler who comprises the second group is by far the greater in number. He does not operate country plants, but purchases milk largely through the wholesale dealers. This milk goes to the various trades like stores, restaurants, etc. And it is here where competition exists and where price cutting is carried out. The peddler is unconcerned with the price he is obliged to pay for his milk so long as he can hold his class of trade and make the desired margin of from a cent and upwards per quart. It is the dealings between the peddler and the stores where continuous competition exists.

On the whole, competition is based on the original price of milk and the factor of surplus is responsible in determining this price. But the producer is able to control this situation if he will only understand and realize his position as a collective body toward the whole.

As a suggestion of correcting some of these abuses, producers should not sell a greater amount of milk than their ability to furnish in the short season. A persistent and careful study must be made of the milk territory contributing to the large market centers. This will reveal a basis of getting at the factor of surplus. As far as determining what the surplus factor is in depressing the New York City market, figures taken of the state are not adequate without a careful survey of the amount of milk used in upstate centers, the milk used for cheese and butter, also all condensed and similar milk products.

The speaker presented a very interesting report of the many phases of the marketing of milk. Following this a very full discussion was entered into by the many who attended. Everybody felt that a clearer and sounder grasp of the marketing problem had been gained.

YOU KNOW IN ADVANCE

Dodge Brothers Motor Car owners know in advance what any service operation will cost.

But they do not pay in advance for service they may never need.

That is because Dodge Brothers do not believe in so-called "free" service, which simply means that the selling price of the car is so inflated that the extra profit is sufficient to cover "free" service costs.

Under the "free" service policy, every owner pays a maintenance fee for the upkeep of every other owner's car—and he pays this fee in advance.

Under Dodge Brothers policy, the owner is not so penalized. He pays a fair, predetermined price for service, but he pays only as he needs it—and he pays only for his own.

Growing Alfalfa on Sand

HOARD'S DAIRYMAN:—With the help of lime and manure, alfalfa can grow on a poor sandy soil if that soil is well drained. This is the experience of Charles Mills of Iowa, one of the most successful legume growers in Linn County. To prove this assertion Mr. Mills can show a thick, even stand of alfalfa, with scarcely a bare spot in it, growing on a piece of land that never did raise a decent corn crop and that produced one of the poorest blue grass pastures in the township.

In fact, it was because Mr. Mills became disgusted with this land for pasture that he decided to break it up and try alfalfa. He is no novice at the legume business and has two other good fields. He has found that failure to apply lime means a disappointing stand and that manure is a great help. Fertilizer is supplied in large quantities by his herd of Holstein cattle and by a carload or two of steers that are fed out every winter. Over 400 loads of manure were hauled out last spring.

After a good application of manure and lime Mr. Mills sowed about twenty acres of this notoriously poor sand to alfalfa a year ago last June, with the result that he now has a field that men will go miles to see. The entire farm lies in a sandy, rolling section but has developed into a profitable property under this definite system of soil building.

EDITORIAL COMMENT

SURPLUS AND CO-OPERATION

Every person in this country should appreciate that we should have some wheat in our bins, cotton in our store houses, meat, milk, butter, cheese, and eggs in storage in excess of our immediate demand. We can well profit by Joseph's experience, for we still have the "lean years" and the "fat years".

In speaking of a generous food supply and the effect of surplus on prices, former Governor Lowden of Illinois has stated:

"The purpose of co-operative marketing of farm products is not to defy the law of supply and demand, but only to make that law serve the farmer. We have too long permitted the bugaboo of surplus to depress unduly the price of the great staple products of the farm. The world has been producing wheat for some thousands of years. Since the time of Pharaoh, however, there has never at any given time been a sufficient quantity of wheat in existence to feed the world for more than a few months. Would we call mankind improvident if enough of wheat were always carried in storage to feed the world for a single year? If not, what shall we say of the system of marketing wheat by which a six months' supply is permitted to lower the price of that necessity of life below the cost to produce?"

FUTURE OF AGRICULTURE

Young men who have some doubts as to whether they should follow agriculture as a vocation need hesitate but little for fear farming will not be profitable in the future. Everything at present points to a favorable agricultural situation for many years to come.

We must remember we have no great fertile sections to be opened up to new settlers. After the Civil War, there were great tracts of fertile land in the Northwest awaiting the pioneer. There are no such lands today. The land that is brought under cultivation requires much labor and large expenditure of money before it can become productive. It should also be remembered that our population is rapidly increasing and each year more food is required to feed the people of the land. Again, the past three or four years many poor farms, those called marginal lands, have been deserted. Here, then, is a combination which should cause us to be encouraged regarding the future of agriculture.

Further, industries of the cities are increasing their activities and this means fewer men out of employment. When the labor is well employed and receives good wages, more farm products are demanded.

For these reasons we see a bright future for agriculture and especially for those who will do their work efficiently. We do not believe the man who does his work inefficiently and in a haphazard way can expect to succeed on the farm or anywhere else. If prices of farm products become high enough so that the most incompetent farmers can make a good living and perhaps some profit, it will mean a large increased production of agricultural products. We do not look for "boom" times, but we do expect the prices of agricultural products will be relatively higher than other commodities as compared to the year 1913.

THE AGRICULTURAL COMMISSION

President Coolidge has appointed an agricultural commission consisting of nine members: Ralph P. Merritt, president of the Sun Maid Raisin Growers of California; O. E. Bradfute, president of the American Farm Bureau Federation; Charles S. Barrett, president of the Farmers' Union; L. J. Tabor, president of the National Grange; Fred H. Bixby, president of the American Live Stock Association; W. C. Coffey, Dean of the Minnesota College of Agriculture; R. W. Thatcher, Director of the New York Experiment Station at Geneva; and W. M. Jardine, President of the Kansas Agricultural College. The chairman is former Governor Robert D. Carey of Wyoming.

Since the fall of prices of farm products in 1920, many suggestions have been made for bringing agriculture back to her proper relationship with other industries. Certain groups believe this can be done through federal and state legislation; others would have the government buy farm products and sell them to foreign nations; some have suggested that the government buy the surplus and dump it into the sea; some think co-operative marketing is the one thing that will save the farmer; and still others believe inefficient production regulated to the demand of the market. Suggestions and plans for aiding agriculture are so numerous, and many of them so faulty, that it was both fitting and wise that the President of the United States select a commission as he has and made up of men who thoroughly understand the agricultural situation of the country and who are in deep sympathy with its welfare.

In recent years there has been much talk of an agricultural program, for thinking men fully appreciate that agriculture is meeting a different situation now than it has in the past. Changes in agricultural practice and thinking must be made if it is to keep step with the progress of other industries. In the building of an agricultural program, many factors are to be considered and no one can hope for this commission to prepare a detailed program. It can call attention to the importance of diversification, of growing crops adapted to certain sections of the country, of producing more products locally, of efficient production, of the value of co-operative marketing, of adequate credit, of the necessity of leadership, of fertile soils, etc.

The agricultural commission has a big job in bringing together information concerning all the various activities of agriculture and then prepare a general plan by which we may unite for the purpose of building agriculture upon a sound and firm foundation. Every thinking man knows that the welfare of this nation depends upon a prosperous agriculture and that the people engaged in this industry must be adequately compensated for their work.

FARMER AND BUSINESS MAN

Two years ago the Board of Trade of Louisville, Ky., fostered the formation of what it termed the Kentucky Live Stock Improvement Association. This organization enlisted the interest of every industry that is directly or indirectly concerned regarding the welfare of the live stock development of that state. This included the city distributors of dairy products, the city and rural banks, the stockyards, all the various breed associations and their members. The organization has been active the past year and a report to us from Mr. C. Oscar Ewing states that definite progress has been made. The annual report of the secretary of the organization, Mr. R. W. Scearce, gives an outline of the character of work done and in brief it is as follows:

One hundred eighty-four bank visits; 54 counties visited; 115 breeders visited; 13 conferences attended; 25 meetings addressed, 1,500 attendance; 46 banks using live stock advertisements; 69 agricultural extension workers visited; pure-bred breeding stock placed in 43 counties; held a beef bull sale at the Bourbon Stock Yards; 70 pure-bred bulls placed, 15 beef bulls, 55 dairy bulls; assisted the county agents in conducting two farmers' tours; 6,500 sheep letters prepared for the use of 20 rural banks; prepared articles for various farm publications on better live stock.

This is good work because it brings the business man and the farmer together. It encourages the farmer because he learns that the worthwhile business man of the city is interested in his welfare and it also brings an understanding to the business man of the city concerning farm problems. Anything that leads to a better understanding between the various industries and especially that of agriculture is beneficial to all members of society.

CO-OPERATIVE MARKETING

In an article in this issue on factors pertaining to co-operative marketing, J. F. Larson discusses some of the fundamentals of successful co-operative marketing and why it has not succeeded in a larger way. He laments that farmers are not unanimous in their desire to market their products collectively.

It is not entirely the fault of these farmers that they do not step into co-operative organizations more readily. Unfortunately for this good movement, some of the men who gained positions of leadership were ignorant of what co-operation can do and what it cannot do. They claimed more for co-operative marketing than it is capable of delivering to its members. The extreme statements made regarding the benefits of co-operative marketing have proven and are proving a severe detriment to the progress of this good movement.

It has been stated that through organization farmers can set the prices of their products and in keeping with cost of production, regardless of how much or how inefficiently they were produced. Comparisons have been made between manufacturers and farmers. It has been stated that the manufacturer sets his price, but the farmer does not set the price on his products. The manufacturer sets his price, but he cannot force the consumer to purchase his products unless the consumer thinks they are worth what is being asked for them. The farmer should be in position to set a price on his products the same as the manufacturer, but he must adopt the same methods as are adopted by the manufacturer.

Many instances the past four or five years can be cited where manufacturers were unable to get cost of production. In some cases factories were closed and went into bankruptcy, and in nearly every case production was decreased. The farmer is not in the same position to regulate his production as is the manufacturer, but he can come nearer to it than he does at present if he will give his business closer attention.

Through a rightly organized co-operative marketing institution farmers are in a better position to sell their products. Store houses can be established so farm products can be taken care of during the seasons of big production and then placed on the market during the season of low production; also markets not oversupplied with certain kinds of farm commodities can be located. Higher prices for farm products will be obtained when co-operative marketing companies render the service of grading, of securing better quality, of meeting the consumer's demands, and in advising farmers concerning prospective demand for their products. Co-operative marketing organizations can stimulate an interest in the producer to know what it costs him to produce. If the farmers knew what it cost them to produce a commodity, there would be less danger of flooding the market with any particular farm product.

We must never forget that successful co-operative marketing begins with efficient production and that no co-operative company, no matter how well organized and managed, can hope to return a profit to the man who persists in keeping low producing cows, cultivating low producing acres, placing upon the market inferior products, or producing more than the market demands.

A Standard Bred Registry

A new registry association has risen out in the cow country of Wisconsin which proposes to put the seal of merit on grade cows having a production of 300 lbs. butterfat in a year. The proponents of the new plan argue that a certificate of registry will not only increase the sale value of the grade cow, but will build up in her owner a greater pride and confidence in his business. They

believe that it will cause owners of this class of cows to give greater care to the selection of the sire to head the herd.

"When a farmer engages in this system," says Harry Bailey, founder and president of the Standard Bred Cattle Club of America, "he will cease to go to the pure-bred breeder and say that he has only grades and cannot afford to pay more than a set low price for a bull. Instead, he will insist upon a sire of such quality as gives promise of getting heifers of such ability and type as will be a credit to him as a breeder of 'Standard Bred Cattle'. This farmer will also have an added inducement to continue his membership in a cow testing association and develop his heifers well in order that he may have a verified record on them."

The registration rules of the new association are simple and the charge is moderate, $2.80 per animal registered. A separate register is kept for the grades of each breed, and the animals will be known as "Standard Bred Holsteins", "Standard Bred Guernseys", etc. The rules governing registration are as follows:

1. No males shall ever be registered.
2. The cow must be sired by a pure-bred, registered bull.
3. The cow must conform in markings to the same requirements as are required by the rules of the association which registered her sire.
4. The cow must have a record of 300 lbs. fat in a year and this record must have been made in a regularly organized cow testing association.
5. Provision is also made for the tentative registration of heifer calves out of standard bred registered cows, registry to be completed when they have made the production requirements.
6. A registry certificate containing a full description of the cow and her production will be issued and given to the owner.
7. As time goes on, pedigrees of grade cattle will be made available and larger service will be done in saving good pure-bred bulls.

Something over 300 head have already been registered by the Standard Bred Cattle Club. The question of the success of this new effort will largely depend upon the desire of Mr. Bailey and his associates to serve the dairy farmer and breeder, and upon their ability to sell the idea at this low cost to a sufficient number of farmers to make the club a factor in the cow business. The proposition appears to have merit. It is founded upon the right principles of registration for dairy cattle, although time may show the necessity of some revision in its promotion and its rules to make it safe as well as popular.

This same thought has been in the minds of many pure-bred breeders and at no far distant date we expect to see our pure-bred registry association develop something along the same lines. Registry by pedigree can well be supplemented by requirements as to conformation to breed type and according to certain minimum production requirements before an animal is admitted to full registration. It should be helpful in raising the average production of the several breeds and in maintaining their reputation as dairy cattle.

The Dairy Situation

HOARD'S DAIRYMAN:—Since 1920 the price of butter has consistently been above the level of most other farm products. During the years when grain, beef cattle, and hogs have been low in price, cream and eggs with their regular weekly or monthly check have been the salvation of many a heavily mortgaged farmer.
